

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, FEBRUARY 29, 1908.

[No. 469.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THOSE who made a special study of military matters have recently been expressing alarm at the dispersal of the studs of the various 'bus companies in London consequent on the advance of the motor vehicle. Evidence of this was afforded in the question which Mr. Lane-Fox addressed to the Secretary for War in the House of Commons on Tuesday. He asked whether, in view of the increase of motor traction and the consequent gradual decrease in the number of horses in use in this

country, the War Office were taking any steps to secure the maintenance of the supplies of remounts available for the Army. Mr. Haldane replied to the effect that the whole question of the supply of suitable horses for military purposes was receiving consideration by the Board of Agriculture, in conjunction with the War Office. There is no doubt that the subject is an urgent one, for the progress made by the automobile during the last few years is doing much to relieve horses of their work as beasts of burden. Ultimately their use will be almost wholly confined to military purposes as well as those of sport and pleasure.

A Reference to the Royal Commission.

MANY motorists are taking a very serious view of the present position in Parliament with regard to motoring, and steps are being taken to interest local authorities in coming into line with motorists in the matter. Should such a result be brought about it should prove a considerable factor in influencing the Chancellor of the Exchequer towards the view that any additional taxation should be devoted to a specific purpose. On Thursday, the 27th inst., Lord Montagu of Beaulieu was to raise a point in connection with the threatened taxation of motor-cars, which is regarded with the utmost interest not only by all concerned with the motor industry, but also by local authorities throughout the country. His lordship had previously intimated that he would ask the Government whether, in framing any further taxation relating to motor-cars, they will bear in mind the recommendations of the Royal Commission on Motor-cars and the Royal Commission on London Traffic, and take such steps as may be necessary to create a national road authority, by whom the main roads of the country should be managed.

Lights on Army Vehicles.

A GOOD deal of misapprehension both in civil and military circles of authority has hitherto existed as to the use of lights on Army vehicles. The new Act governing the lighting of vehicles generally, which came into force on January 1st last, covers the subject, and in conjunction therewith the King, by an Order in Council (just published as an Army Order), directs that the provisions of the Act shall not apply at all to gun carriages or limbers, ammunition wagons or limbers, general service wagons carrying ammunition, machine guns, small-arm ammunition carts, tool wagons and tool carts. Other vehicles included in this exemption order are technical stores wagons and carts, cable

wagons, limbered general service wagons, air-line wagons, balloon wagons, gas-reservoir wagons, wagons for collapsible boats, trestle wagons, pontoon wagons, travelling ovens and water carts. It is also not to apply to any of the following if and whenever they are employed in connection with the field training or manœuvres of any portion of the military forces, or in the opinion of the general officer commanding-in-chief the troops with which they are employed, or of the Secretary of State for War, the military necessities of the public service require that they shall not for the time being carry or display the light or lights prescribed by the Act, viz., general service wagons, bread and meat wagons, forage carts, ambulances, Maltese carts, bicycles and road locomotives not falling within the Motor Car Acts, 1896 and 1903.

The Taxation of Motorists.

As to the way in which taxes are regarded, something may be gleaned from the opinions of well-known motorists that have reached us during the last few days. We are not thoroughly convinced of the soundness of the tactics that have taken the hint of the Chancellor in 1907 as a practically adopted fact in 1908. The duty of local authorities to provide for new locomotion might have been made a primary fact in the position, and an active agitation entered upon to arouse them from their lethargy in that respect. Such, however, is now impossible, and we are face to face with the general idea that motor-cars will be further taxed, and one of the points remaining to be settled is as to the severity of the impost. To suggest reprisals in the shape of the introduction of a tax on horse-drawn vehicles, reminiscent of the ill-fated "wheel tax" of the late Lord Goschen, will, if seriously pursued, only aggravate the position. The great work to be done is (1) to secure that the road shall be brought into proper condition to carry the new locomotion; (2) to provide that men who use vehicles in a trade or professional way shall not be imposed upon by the State because they are possessed of the spirit of enterprise; (3) to secure fair play to the middle class motorist, whose enjoyment of the car is mainly in search of health for himself and family; and (4) to see that the taxes shall be graduated in such a way that the moderate man shall not be discouraged in assisting the industry by joining the ranks of motorists. These are points that need to be kept in mind by Mr. Asquith and his advisers; they can, perhaps, find many illustrations in the experiences of our readers, who are invited to contribute to the symposium begun on another page.

Speed Limits.

THE record of the fate of the applications which have been made for special restrictions of the speed of motor-cars in various places is very interesting. It proves the wisdom of allowing the departure from uniformity in the matter to remain under the control of a central authority. Since the Act was passed 103 applications have been received by the Local Government Board or county boroughs. No fewer than 49 were subsequently withdrawn or abandoned before inquiry; 19 were refused by the Local Government Board; 22 have been granted or promised, and 13 are still under official consideration. If this is the result after the applications from minor councils had been sifted by the county authorities, what would have

happened had the requests been allowed to go direct from the parish to Whitehall? This is one of those cases where an infinite deal of pains may be taken for nothing, save worrying motorists and others, whom many bucolic wiseacres seem to count as unworthy of consideration.

Roads in Ireland.

SEVERAL matters for congratulation were mentioned at the annual meeting of the Belfast Centre of the Irish Roads Improvement Association, over which Mr. John Brown, F.R.S., presided. The executive committee point to the great increase in the number of steam rollers purchased by County and City Councils since the inception of the Association as proof of the progress that has been made in educating public opinion to recognise the importance of the roads. Undoubtedly the backward condition of many of the great highways in the Emerald Isle has been due to the general apathy, and Mr. Hackett in Tipperary has done much to dissipate this by the practical demonstration he has given of the value of road improvement to the locality. We trust that the work of the Irish Roads Improvement Association will be continued with the vigour that has characterised it during the last seven years. There is still much room for improvement, and it will be some time before anything like perfection is attained. Then the motorist will be recognised as an important factor in the general progress.

Touring in Italy.—The Normal School, Pisa.

Horse and Motor Traffic.

IN view of the discussion now raging around motor-cars, the figures which the President of the Local Government Board has given Mr. Cathcart Wason in the House of Commons are of interest. During last year licence fees were paid in respect of 75,567 private motor-cars and cycles—an increase of 8,452 as compared with the previous year. In the period of 1906-7 licence duty was paid on 413,000 horse-drawn vehicles, excluding hackney and stage carriages, so that the proportion of automobile to other traffic is becoming very considerable. Following this answer by Mr. John Burns came a question from Mr. Fell, M.P. for Yarmouth, who wished for some differentiation between British and foreign cars, which he was unable to obtain.

Belfast Activity.

EVIDENTLY the new organisation that has lately been formed at Belfast to look after the interests of the motoring movement in that city will have plenty to do. Not only has a certain amount of antipathy been shown in connection with the threatened speed limit, but the action just taken against a local firm with regard to alleged obstruction in the street proves the need of automobile education in the city. In this particular instance—details of which are given on another page—the pro-

prietors of a depot and garage had four cars call at their place. None were directed thither for repair, but two were cars on hire which were calling for a supply of petrol; the others were owned by local gentlemen. According to the evidence the business is a growing one, a point which should weigh with the authorities. We agree that the law must be obeyed, but it should also be tempered with common sense.

Teaching Horse Drivers.

EAST and West seem at last to be agreed that the vagaries of those responsible for the driving of horses through the streets require police attention quite as much as does the behaviour of those in charge of motor vehicles. At East Ham Police Court the other day a trio of sleepy drivers who have long been prone to regard the highway between Romford and the London markets as a kind of dormitory, were charged with slumbering while in charge of their lumbering vehicles. The magistrate, recognising the dangers of such drowsiness on the highway, appropriately fined them, and doubtless the warning will be conveyed to others of their *confreres* similarly indifferent to the safety of others. Now we learn that in the West End police attention has been drawn to the fashion of drivers leaving horses unattended while they are delivering goods or amusing themselves elsewhere. This view is going still further into rural districts, and at Haywards Heath recently the local superintendent of police called the attention of the magistrates to the prevalence of the dangerous practice of leaving horses unattended. The practice is rendered all the more risky in view of the development of motor traffic. The clerk to the magistrates suggested that the only way to put a stop to the nuisance would be to summon the drivers, and also take proceedings against the owners of the trap for aiding and abetting the offence. The superintendent said he would act upon the advice, as repeated cautions had really had no effect upon the responsible parties. If the police will be as active in that work as they have been in trapping motorists, they will earn the appreciation of the community in which they operate.

The Camera and the Car.

THAT motorists are inclined towards photography is known to all who travel. With many enthusiasts the camera is almost as indispensable as the luncheon basket, and the pleasure of perpetuating records of holiday tours is half the enjoyment of a motor trip. At several gatherings of provincial motor clubs during the past winter photographic reminders of enjoyable motoring days have been on view; and a few evenings ago the Nottinghamshire A.C. held a well-organised exhibition of pictures taken by members when motoring. Now we hear that the Motor Yacht Club intends to hold a similar exhibition on the "Enchantress" during the first week of May. The popularity of such competitions is growing in motoring circles—on land and sea—and an incidental aspect of the business benefits conferred by the automobile is the fillip it has given the photographic industry.

Advertising on the Landscape.

AT length public protest has been made against the way in which the landscape is being embellished in many parts of the country by the announcements of garages and of firms that desire to be of assistance to those who travel. At the annual meeting of the English Lake District Association it was incidentally mentioned that the road between the Ferry and Wray Castle, on the west shore of Windermere, had been improved, and grants made towards the easing of corners on roads in Kentmere and Langdale. The committee renewed their appeal for a discouragement of the alleged disfigurement of the district by hoardings erected near the highways by motor-car manufacturers and petrol dealers. The solicitor to the Association emphasised the appeal of the committee, and

reminded the meeting of the Act of 1907, whereby local authorities could make by-laws for the regulation and control of hoardings and other advertising signs that tended to disfigure the natural beauty of the landscape. He suggested that the County Councils of Westmoreland, Lancashire, and Cumberland should be asked to make by-laws. It was decided to write to the three County Councils and to the county automobile associations urging them to take action.

Motoring M.P.s.

MOTORING has few really qualified advocates in the House of Commons, and the loss of Mr. Harvey Du Cros leaves their ranks denuded of the most practical among them. The return of his son would afford numerical compensation. Of course the M.P.s who rode to victory on motor-cars are a numerous band, but their knowledge of automobilism is theoretical rather than of the expert character that turns votes in divisions. And in view of the discussions that are soon likely to

the sanction of Parliament was obtained for the proposal, it was defeated by the merchants of Thames Street. During all succeeding years the wise ideas of Wren with regard to thoroughfares have been generally ignored, until the stress of traffic is again bringing the subject to the notice of the authorities with such insistence that the Local Government Board is taking it up. Any proposals which are made in the matter must take account of the growing needs of new forms of traffic.

Dust and Public Health.

NOT only surveyors and those directly responsible for the road are concerned with the mitigation of what is generally described as the "dust nuisance," but Medical Officers of Health, particularly in the South of England, seem to be studying the interesting problem. A few days ago the Public Health and Local Government Officers Association of Sussex held its annual meeting at Lewes, when Mr. F. J. Wood, the

An Interesting View on the Route of the Motor Union of Western India's Reliability Trial.

be heard on the matter at Westminster the education of M.P.s must be continued from within the walls of the House as well as in the columns of the public press. In such work Mr. Du Cros, jun., can—as Mr. Du Cros has—render good service to the movement.

Town Planning.

MOTORISTS have something more than an academic interest in questions of town planning, such as are brought to the front by the Garden City Association in its latest publication with that title. On the first page Sir William Treloar refers to the traffic difficulties of narrow and congested streets such as are realised by motorists wherever they drive through large centres of population. Had Sir Christopher Wren had his way London would have been a very different kind of place to what it now is. His idea was that there should be three principal streets leading east and west, and one or two cross streets which were to be at least ninety feet wide; the lesser streets were to be sixty feet. All thoroughfares were to be straight. Although

county surveyor of the eastern portion of the county, opened a discussion on "The Maintenance of Roads" for the edification of those who regard the dust question from the health standpoint. He mentioned the question of efficient drainage as one of the essentials to be thought of, and went on to say that not every authority could afford to properly "bind" their road services owing to the question of expense. Whatever stone was used dust was inevitable; it was by attrition that the dust formed. The cost of using a form of macadam as a binding material was out of all proportion to the benefits likely to be obtained. Tarring had been suggested for the county of East Sussex, but on a road 18 ft. wide it would mean a cost of £520 per mile, thus quintupling the sum now spent on maintenance. By the use of machinery the cost might be reduced to £44 per mile; if, however, they were to tar-spray the whole of the Sussex roads it would mean an addition of 2d. to the rates. In this last sentence is the key of the whole situation, and we doubt whether the ratepayers would appreciate a mitigation of the dust nuisance at such a cost, especially in view of rising rates generally.

The Taxation of Motor Cars.

THE prominence into which the Motor Union has brought the subject of the taxation of motorists has given a fillip to the public discussion of the matter. Apparently the deputation to the Chancellor of the Exchequer last week is regarded in many quarters as a recognition, by motorists, of the equity of further taxation. The acceptance of such a view, without qualification, is not calculated to further the cause of automobilism, and that the present position is one of some danger is apparent from the correspondence we have received since our last issue. Motorists can render no better service just now than in endeavouring to educate the public with regard to the effect of further taxation in thwarting the progress of what is rapidly becoming a national industry of primary importance. Hence we welcome the following expressions of opinion from representative motorists, whose presentment of the case against increased taxation for Revenue purposes only should afford valuable reading to Parliamentarians and the public alike. Several other letters reached us as we were going to press, and a selection from these, as well as any others that come to hand from readers during the next few days, will appear in our next issue.

A MINISTERIAL PROTEST.

The Rev. H. G. Morgan, Rector of Stoke Lacy, is well known in connection with the Herefordshire A.C., which has done so much for the "small car." His views may be regarded as representative of a large and important section of the motoring community. He writes to us as follows:—

"I consider that a further tax would be unfair to motorists of moderate means; also that a heavy tax will decrease the number of cars kept by this class of motorists (I am one of them) and in that way injure not only the men employed in motor manufacture, but the still larger number employed in garages, &c. It is practically certain that taxation would not produce much over £200,000 per annum; if it attempted to produce more it would defeat its own object."

THE SPORTSMAN'S VIEW.

Mr. John Hargreaves is a West Country sportsman who will be remembered in connection with the elimination races for the British Gordon Bennett team in the Isle of Man. He writes us as follows:—"We are already very heavily taxed—in fact, far more so than any other road traffic—and it appears to me most unfair if further taxation is imposed on motors."

Mr. H. R. Kirk, of Leeds, is the owner of several cars and was an entrant in some of the classic events in the motor world in the early years. His enthusiasm for motoring also extends to boating. His views will have general acceptance and are as follows:—"I am quite of the opinion that motorists are already too heavily taxed in proportion to other vehicular traffic, and fear that any further pecuniary burden in that direction would seriously hamper the motor industry of this country. Should it be found necessary, however, to contribute towards the upkeep of the roads, all other classes of vehicles should certainly be made to contribute proportionately."

A MEDICAL VIEW.

Dr. H. E. Bruce-Porter was the first doctor in England to employ a motor-car in his professional work, and when resident at Windsor a few years ago trained the late Queen's horses to familiarity with his automobile—thus setting a fashion which has had a wide vogue. He is the hon. sec. of the Committee of Medical Men using motor-cars, and his views may be regarded as thoroughly representative of those held by the members of his profession. In reply to our request for his views on motor-car taxation he says:—

"I believe, in Germany, doctors' cars are exempt, and, while too much to expect anything of the kind in this country, it would be reasonable for the doctor's car to be treated as a trade

vehicle and taxed at trade rate, even though the car should be used from time to time for non-professional purposes. The amount of gratuitous work performed in this country by the medical profession is enormous, and few people can have any idea of how enormous it is. A great deal of the work, if not done gratuitously, would have to be paid for by the rates, as many of the recipients of medical charity are quite unable to pay for the services rendered. A tax of a few pounds more or less does not affect a successful medical man living in London or in the country, but there are thousands of men scattered up and down the country, obliged to use a heavy car owing to the condition of the roads over which they have to travel, on whom an increased tax of a few pounds would fall very heavy. I should not object myself if this rebate were confined to medical men whose income did not exceed a certain rate, which can be afterwards determined on. Deputations have already waited upon the Chancellor of the Exchequer urging preferential rates for medical men, and should he be able in his budget to allow of this being done, I hope it will meet with the support of the members on both sides of the House. If the funding of this tax by the Chancellor of the Exchequer should prove a step on the way to nationalising the roads, it would be a very great improvement on the present state of care of the main roads. We require more money for national purposes in the twentieth century than our ancestors did in the nineteenth, and this money must be raised, and it can afford no amusement to any Chancellor of the Exchequer to introduce a tax which would be unpopular with any section of the community."

OPPOSITION TO EXTRA TAXATION.

Mr. T. Scott Foster, J.P., of Southsea, who has been twice mayor of Portsmouth, and long associated with the public life of Hampshire, where he has been able to do something in lessening the antipathy towards automobiles, writes:—"I have been a motorist, driving my own car, for eight years, and am opposed to extra taxation, believing the present tax quite high enough, and that any addition would be injurious to a growing industry. Having two cars I pay £4 4s. and £2 2s. a year, with 5s. for driving licence, and £1 registration for each new car. I find my licences with registration works out at an average of £7 16s. per annum and 15s. per man. I should sell one car if the tax is increased. A coach and four or a carriage and pair may be kept for £2 2s. a year. The objection is all the stronger because the money will go to the thriftless and will be taken from the provident. If for defence of our country one would strain a point, but for the wild cat schemes of some Parliamentarians there are strong objections."

A COUNTY COUNCIL CHAIRMAN'S OPINION.

Sir Ralph Littler, the Chairman of the Middlesex County Council, is of the opinion that "no tax ought to be raised for Exchequer purposes on locomotion. There is no 'luxury' which, as such, justifies taxation so little as motoring. The creation (of the motor-car) involves the employment of a very large amount of skilled labour, in addition to distributing a considerable amount of money throughout the country. But it wears the roads; it involves outlay for improvement of roads, for signals, for dust prevention, and in other ways, and may fairly be called upon on this score to pay more in proportion; and every farthing raised should be spent on the roads. I do not understand the suggestion of 'the odium of starting a new tax, and the expense of collecting it'; it could be collected by the existing machinery. Assuredly the main roads throughout the country should be maintained by the Government, as in France. The present system is anomalous, wasteful, almost barbarous."

A SCOTTISH OBJECTION.

Mr. Thomas Shaw, the well-known motorist, of Dundee, is of the opinion that the M.U. would have done well to let

sleeping dogs lie in place of approaching the Chancellor of the Exchequer. "I am not surprised," he goes on to say, "at the attitude taken up by the Chancellor. Naturally I am against any and all additional taxation of motor-cars, because it is a wrong way to approach the subject. It is neither the business nor the interest of the Government to put any obstacle in the way of a great industry which is beginning to hold its own against foreign competition. A special tax such as is proposed would doubtless be over and above the taxes which motorists are already called on to pay. Only on one condition would I be prepared to acquiesce in a tax of the kind, and I am sure that the majority of motorists agree with me, and that is that the proceeds be earmarked for the improvement and maintenance of roadways. In that event, motorists, if they did not welcome the tax, would certainly not be disposed to cavil at it. Otherwise, I should think any tax would be highly objectionable. Personally, I do not believe that motor-cars cut up the roads any more than other kinds of vehicular traffic—certainly not where the road is sufficiently well made to carry ordinary traffic. If there are depressions in the road surface, that causes a passing car to bump. The wheels, revolving at a high speed, cause, at

weight is to be the basis of taxation, this class of motorist, which includes many doctors, will have a distinct grievance. In this, as in other matters, I think it would have been well if, at the moment, the Motor Union had seen fit to stay its hand."

A HEAVY CAR POINT.

Mr. T. C. Aveling, Assoc. M. Inst. C.E., of Birmingham, was one of the pioneers of motoring, and rode with Mr. J. Holder on his 24-h.p. Panhard in the Paris-Madrid race. He is interested in lessening the cost of road transport, and believes that:—"In taxing motor-cars consideration should be given to the commercial vehicle. As regards the heavier type fitted with non-resilient tyres, there does not appear any need for further taxation if the authorities will only see that the standing regulations are carried out, i.e., that the speed of five miles per hour is not exceeded by this vehicle, and that the aggregate sum of the axle weights of the motor-car and trailer does not exceed 12 tons."

THE MOTOR UNION'S DECLARATION.

The Chairman of the Motor Union, Mr. W. Joynson-Hicks, sends us the following statement with reference to the views of

The Right Hon. the Earl of Dunraven at the wheel of his new 40-h.p. Crossley on which he recently left England for a long motor trip to Pau.

The car is finished in a fine pale grey, the mouldings of the body being brought into relief by the addition of light red lines. The upholstery is pale grey morocco leather and all the fittings are in nickel silver. The vehicle is the second 40-h.p. car supplied to Lord Dunraven, and in a letter just received by Mr. Charles Jarrott from Tours he expresses his extreme satisfaction with it.

the next point of impact, a certain amount of damage, and so the evil of badly-made highways is perpetuated. The highways of the country, after all, are a matter of Imperial concern, and hence the expediency of earmarking any funds derived from the taxing of motor-cars—and, indeed, of other vehicles—for the purposes of improvement and maintenance. Take, for instance, a county like Ross-shire. It is very sparsely populated, and it is a distinct hardship on its people to keep up a large mileage of roadway, which, generally badly made to start with, suffers from wear and tear to a greater extent than the better macadamised roads in the Lowlands. I observe that the Motor Union recommend that taxation of cars should be on the basis of weight instead of on that of horse-power. I think that is certainly wrong. There are motorists not a few who like a heavy, substantial car of low horse-power, incapable of any great speed. Although it is heavy, it will not have the same—I should say very much less—destructive effect on roads as a lighter, more powerful, and consequently faster car. If

his organisation with regard to the Parliamentary situation:—"The Motor Union desires to inform you that there is a strong probability of the Government proposing additional taxation in the forthcoming Budget upon motor-vehicles for general revenue purposes. The policy of the Union with regard to this taxation is not to oppose any reasonable proposals, provided that the funds so raised are put into a central fund and administered by a Central Department as a grant in aid to local authorities for the maintenance and improvement of the roads. The Union will oppose any additional taxation on motor vehicles which is to be applied only to the relief of the general taxes of the country."

The gale on Saturday was particularly violent on the Firth of Clyde, and on the sides of Gareloch the highway was impassable by reason of flooding. At one point the waters broke over a motor-omnibus and brought the mechanism to a standstill.

THE WEIGEL RACING CARS FOR THE A.C.F. GRAND PRIX.

AS is now fairly generally known, three cars have been entered by Weigel Motors, Ltd., for the A.C.F. Grand Prix race (heavy cars), which is to be held on the Seine Inferieure circuit in July next. The contest is being held under the conditions agreed upon last year at the conference of delegates of the most important national automobile clubs in the world, the main points of which are that the engines of four-cylinder cars shall be restricted to a bore of 155 mm., and the weight of the vehicle to 1,100 kilogs. We are this week able to give two views of the engines which are being built for the specially designed Weigel racing cars, an examination of which will show that they are of an entirely different design to those usually fitted to Weigel vehicles. The motors comprise four-cylinders cast *en bloc*, this pattern having been adopted first to obtain as large a water area as possible and secondly to make a rigid base for the whole of the cam-shaft movement, which is above the cylinders, the brackets for the support of the same being cast in one piece with the cylinders. In fact, it will be seen that the cylinders contain in the same casting all brackets

material. The bearings—both the big and small ends of the connecting rod, are of phosphor-bronze with white metal liners. The crank-shaft is of the ordinary four-throw type, the webs between the journals being of an oval section and the whole exceptionally strong and light, all the journals being drilled through with the object of reducing the weight. It will be noticed that the base chamber is merely a covering for the crank-shaft, there being no cam-shafts introduced or working parts of any description beyond the main shaft. The chamber is of aluminium, and carries in its lower half a tube which is part and parcel of the casting through which the oil for the forced lubrication passes, the oil emerging from the tube through the small jets provided as shown. The oil is circulated by a pump and passes out of the jets in a continuous stream mounting as high as the top of the cylinders. The engines of the Weigel racers certainly should not fail for want of lubrication.

The method of driving the cam-shaft pump and magneto that has been adopted is also worthy of notice. The cam-shaft—the cams of which are case-hardened—is supported on the tops of the cylinders in three Hoffmann ball bearings—one at each end and one in the centre. At the end of the cam-shaft nearest the dashboard is fixed a high-tension distributor for use in connection with the accumulator

Transverse and Longitudinal Views of Engine of Weigel A.C.F. Grand Prix Racing Car.

and parts which are required for the support of any other portion of the motor. To prevent any difficulty arising with regard to the cylinder bore, a size of 154.5 mm. has been adopted so as to be on the safe side; at the same time the greatest thought and care have been given to the question of obtaining the most efficient engine of the bore given.

The feature of the motor is the location of the valves at an angle of 45 deg. on each side of the cylinders, the exhausts being on the left side and the inlets on the right. The valves, which are of unusually large size, 75 mm. on the face, are so inserted into the cylinders as to be within the cylinder proper without the addition thereto of any pockets, thereby permitting the ready admission of the gases and the emission of the exhaust. The inlet valve is contained in its own seating, which when pushed bodily into the port made to receive it is held in position by a yoke secured by three nuts. The exhaust valve is water-cooled round the guide and the valve seating, both the guide and the seating being part of the cylinder proper. The piston is of the floating type, that is to say, it is provided with rings both at the top and bottom. The head of the piston is of a peculiar pattern, designed to obtain a very high compression and yet clear the valves. The connecting rods are of the ordinary type, made, however, exceptionally light, yet strong, by using special

system of ignition, provided as a reserve in the event of the failure of the magneto. At the forward end of the cam-shaft is fitted a worm which engages with a worm wheel; the latter, in turn, meshing with a worm driven by a vertical shaft through two other worm wheels, fixed, one on the lower end of the shaft and one on the crank-shaft. The vertical shaft is carried on ball bearings fitted into the base-chamber in the lower end, and in the casing provided at the top of the cylinder at the other. The vertical shaft is coupled to the worm wheels both at the cam-shaft and the crank-shaft end by a toothed coupling ring, which can at a moment's notice be disconnected and the whole of the vertical shaft removed without any tools being required, the coupling rings being held in position by a pin having a semi-circular movement for disengaging. By this arrangement if it is ever necessary to re-time the whole of the cam-shaft, there is no necessity to remove the latter, it being possible to set it by uncoupling the connection between the vertical shaft and the cam-shaft, and placing the crankshaft at such different position in relationship with the camshaft as may be required. For the removal of any of the worm wheels with their short shaft, either at the top or bottom end, it is only necessary to undo four screws and remove the cap holding the ball race in position, when the shaft with the ball bearings and the worm wheel can be immediately

taken out. Thus the whole of the connection between the cam-shaft and the crank-shaft is immediately removable and easily replaced.

Continuing to deal with the cam shaft, it will be noted that above it there is fixed in a rigid position a hollow shaft upon which are also rigidly fixed four separate bridges. The latter are hollow at each end to receive within them the rocking arms which actuate the valves. On the valve end of the rocking arm is fitted a hardened ball pin which presses down upon the valve, while on the other end is a hardened roller on which the cam bears. It will be readily seen that as the cam shaft is revolved and the cams engage upon the rocking arm they lift the rocking arm at the cam shaft end and lower it at the valve end. The arms are held in position upon their bridges or brackets by a hardened bearing, which is removable by undoing one nut, and thereby permitting the immediate replacement if necessary of the rocking arm.

Reverting to the question of lubrication and the pump which supplies the power for the forced oil circulation, the vertical shaft which actuates the cam shaft is continued down to the bottom half of the crank case, and the oil pump fitted to it, one shaft thus practically driving both the cam shaft and the lubricating pump. Between the shaft and the pump a coupling ring is also fitted, so that the parts can be disconnected and assembled in the same manner as the others.

Passing now to the water circulating pump and the magneto, at right angles to the vertical shaft which operates the camshaft and the oil pump is a shaft driven through a worm wheel, connected to the pump on the left hand side of the engine and the magneto on the other side. The pump and magneto, which are both fixed to brackets cast bodily with the crankcase, are connected to their shaft through a coupling ring of the type already described, so that either part can be immediately removed and new ones substituted in their place in a few seconds' time.

Viewing the engine as a whole, it will be found that practically the whole of the accessories and the forward part of the motor are each equally removable, and that while the whole of the revolving parts are carefully enclosed, no single piece thus protected requires the removal of any portion of the crank case to get it out. All the spiral worms are cut solid with their shafts, as are all the connections for the coupling rings.

It will be noted that the drawings do not show the stroke of the engine or the carburettor, Mr. Weigel preferring to keep these items secret for the present. In fact, as regards the piston stroke, these drawings have been distorted to prevent the possibility of the dimensions becoming known. A few other details of the Weigel racers can, however, be given. They will be of the live axle type and have a wheel base of 9 ft. 2 in. The gear-box will give three forward speeds and a reverse actuated through a "gate" control, and giving a direct drive on top speed. The back axle will be the same as used on the Weigel 25-h.p. car, Weigel Motors, Ltd., informing us that throughout the whole of last year not a single axle breakdown occurred. The frame will be of pressed steel of special design, so as to permit the seats to be bolted direct on to the chassis without the necessity of building them up. The chassis will be exceptionally low, and the driver's seat will not be more than 28 in. from the ground, which is between 4 in. and 5 in. lower than the lowest car built for last year's Grand Prix, and roughly about 1 ft. in front of the rear axle. Thus the whole weight of the driver, the petrol and the tyres will be placed well back. In addition to the forced lubrication a pressure feed lubricator, with sight feeds on the dashboard, will be provided on the dashboard. Petrol will be carried in a tank at the back of the driver's seat, and will be pressure fed to the carburettor, arrangements being made for carrying the spare tyres round the petrol tank; in other words, the petrol tank will be in the centre of the tyres.

ON Thursday, at the annual meeting of the Bedford Park branch of the Middle Classes' Defence Organisation, a discussion took place on the question: Shall Back Common, Stamford Brook Green, and Ravenscourt Park be spoilt to make a motor road?

SOME NEW IGNITION SPECIALITIES.

We illustrate herewith a new contact maker (Fig. 1), for use in connection with the ignition in multi-cylinder engines, which has lately been introduced into this country by Messrs. Welté and Owens, Ltd., of Colquitt Street, Liverpool.

FIG. 1.

The feature of the device, which is of the rolling contact type, is that it is mounted on ball bearings, so that any wear that may take place, which might cause oscillation and bad contact, can be taken up by means of the adjustment screw ring at the back of the instrument. The inside contact roller is also mounted on balls, which are kept well supplied with oil

through the medium of a large oil duct or groove let in the commutator casing. The single roller used is of a large diameter and forced outwards against the fibre ring segments by a compression spring, by which perfect contact is obtained. The contact segments, the number of which varies in accordance with the number of cylinders, are built up on a scientific principle—the centre portion, being made of steel, gives a good wearing surface. On each side of this steel centre are soft copper strips, which are excellent conductors; and, furthermore, on the outside of these are two strips of brass which bind the whole together, whereby a very close fitting is obtained when it is necessary to make adjustments. The earth terminal is fitted to an arm on the contact-maker casing, whereby a perfect return connection is obtained. The device, which will, it is claimed, run well in oil or grease, without the possibility of a poor electric connection, is self-contained, and can be easily fitted to the half-time shaft of any engine in a very short space of time by the simple process of locking the two set screws fitted in the collar at the back of the contact maker, which fits over the shaft. Messrs. Welté and Owens have also sent us a sample of an American sparking plug known as the "Spitfire" (Fig. 2) they

Fig. 2.

are putting on the English market. The plug is of the porcelain-insulated variety, the feature being the extension of the screwed portion in the form of a cap or dome having two long slots in the sides and a hole in the top, the spark passing between the end of the usual central rod and the sides of the hole. The rod terminates just below the cap, so protecting it and preventing it from being damaged or bent when inserting the plug in the cylinder. The arrangement of the dome is claimed to be such that there is no danger of breaking down the insulation by deposits of oil or carbon, and that it facilitates the rapid ignition of the gaseous mixture. It is also stated that much weaker currents can be used to obtain the same results than with the ordinary open end plug, and that with equally strong currents a much more energetic ignition is obtained. The plug is so made that it is very easily assembled and taken apart. The porcelain is set into the base, and is tightened between the cap and the base, while provision is made for readily adjusting the central rod. The plug, which appears to be thoroughly well made, is supplied in patterns suitable for use in connection with accumulator or magneto ignition.

THE RATIONALE OF LUBRICATION.

By J. W. FRINGS.

(Concluded from page 1131, Vol. IX.)

IT is a matter of comparatively simple calculation to ascertain the relatively exact quantity of oil necessary to provide efficient lubrication for a particular purpose. But it must not be overlooked that this quantity depends, in a very high degree, upon the physical and chemical characteristics of the oil, and may be actually 100 per cent. or more for one quality of oil than for another. It is always desirable, also, to allow a fair margin above the minimum necessary; for a safety factor, to meet possible contingencies in obstruction of supply, the presence of foreign ingredients, or a drop in the potential value of the oil itself. Enough should always be used to mitigate any conceivable evil likely to arise from either of these possibilities. Beyond this, excessive lubrication, though not necessarily harmful to the machinery itself, is a source of inconvenience and annoyance, to say nothing of the pecuniary loss occasioned by wasteful and unnecessary expenditure. The quantity of the lubricant to be used, therefore, should be strictly proportioned to the duty it has to perform. The necessity for its continuous application, whilst the engine and other moving parts are in action, follows, as an inevitable conclusion, the considerations given above, on wastage, physical de-

The Fire-Engine recently supplied to the Liverpool Fire Brigade by Messrs. Henry Simonis and Co.

terioration and chemical change. These processes are continuous and concurrent, and the renewal must, of necessity, be continuous likewise. It is apparent, however, that this continuity of application will be only relative when regarded from the standpoint of time. There will not be necessarily a steady and absolutely continuous stream of lubricant to a particular bearing, on account of the difficulty of exactly proportioning the flow to the exact rate of combined wastage, &c. The application of the lubricant, whether by drip feed or force-pump, is actually periodic in point of time, but continuous in relation to the movement of the engine, a fresh supply being afforded before the last has had time either to dissipate or lose its essential characteristics. The prominent feature of this necessity for continual application is the difficulty of providing a bearing which will retain for any length of time sufficient lubricant. Hence it is essential that a constant supply in replacement be maintained.

Effective distribution of the lubricant brings us to the consideration of the "method of oiling." There are in existence numerous systems of widely differing character, for each of which specific claims of particular advantages are made. Many of them, no doubt, are very good in principle, and, if they could be relied upon absolutely to perform, in their application of the lubricant, what is claimed for them in principle, there would be fewer cases of under and over lubrication,

with their attendant unspeakable evils and annoyances. The chief factors which militate against the efficient performance of any other system than a purely "mechanical" one are the differences in viscosity of the oil due to changes of temperature, the loss of power in discharge by friction against the delivery pipes, the comparative smallness of the bore of the latter, by which the smallest obstructions will suffice to choke them; and the general uncertainty which attends any system other than a mechanical one when the divergent and erratically compounded motions of a motor-car on the ordinary roads are permitted to interfere with its performance. It is reasonable to assume that the perfect lubricator has not yet been marketed, but, in the meanwhile, it is desirable to have the best approach to it that has been made, and that will be a system which conforms most nearly to a perfect conquest of the difficulties to which reference has been made. We have no desire to inflict an apparently wholesale condemnation on the many systems in use which are not mechanical—gravity, drip, and exhaust or water-pressure feeds, with or without auxiliary pumps. Each undoubtedly is very effective in its way, when care is taken in the design of the system to reduce to the lowest point the other factors of disturbance. But, in the consideration of a function upon which the very life of the principal portion of a mass of delicate, complex and expensive machinery is concerned, nothing less than the very best system for ensuring the longest possible term of life, by reducing to a minimum the wear and tear when in action, should be accepted. Even a purely mechanical system is not wholly independent, and entirely capable of overriding all the difficulties referred to. With the most excellently designed system of "force-pump supply," controlled by the engine itself, there is still occasion to view the necessities of the other points raised. The size of bore in its relation to friction, possible obstructions, and the changes in viscosity; and when these have all been duly considered and overcome, and a system evolved which is practically fool-proof in its simplicity, automatic in its performance throughout, and continuously consistent in its action, there is still existent a measure of necessity for a careful, thoughtful, and intelligent handling of the lubricating system of the car, in case, as very frequently obtains, "the unexpected happens."

To sum up, quality of the lubricant is by no means of the second or third rate importance that some car-owners attribute to it. The colour, specific gravity, and viscosity are not absolute tests of its value as a lubricant, for these qualities may be easily simulated. Physical and chemical tests are alone of use to determine the relative value of a lubricant by comparison with its cost. The quantity, dependent primarily upon the quality, and proportionately upon the particular bearing, once ascertained, with a good system of supply, will need little subsequent adjustment. The final points of continuous application and effective distribution are largely governed, as to their success or non-success, by the method adopted. Any system is good in so far as it will effect its purpose with more or less personal attention, but that one which will function with the least measure of the personal element, other considerations being equal, must be the best and most suitable. In any case, whatever system be adopted, there is still the omnipresent necessity for intelligent overlooking.

THE Scottish A.C. has issued a certificate of performance of the trial of "Ross" spirit distilled by Messrs. James Ross and Co., of Linlithgow, from Scotch oil shale from mines on the Hopetoun estate. The trial was made on a 40-h.p. Berliet car, which had a total laden weight of 1 ton 13 cwt. 1 qr. 17 lbs. An ordinary Berliet carburettor was used, and the journey was one of 382 miles in three days. The specific gravity of the fuel used was .715 at 47 deg. Fahr., and .712 at 53.6 deg. Fahr. 22 gallons 3 qts. 1 pt. of spirit was used with the following result:—Car miles per gallon, 16.78; ton miles per gallon, 28.03; gallons per car mile, .0595; gallons per ton mile, .03567. Petrol was injected into the cylinders prior to the re-start on the mornings of the second and third days of the test.

A JAUNT IN NORFOLK.

There's beauty all around our paths,
If but our watchful eyes
Can trace it 'midst familiar things,
And through their lowly guise.

SO says Mrs. Hemans, and so must all who have, thanks to the modern car, been able to wander about Norfolk. And that's where an automobile comes in—no worry about trains, no conscience pricking about the horses' load, nothing is needed but a good "well-looked-after" machine and

The Garden of Sleep, Cromer.

plenty of petrol and lubricating oil, and no matter in which direction your fancy tends, it can be gratified. Variety of scenery—what more glorious than a run over the West Cliff from Cromer, past the Runtons, and by the ruins of the priory founded by Lady Isabel de Cressy, to Sheringham, with its glorious woods on one side and the ever-changing sea on the other; while, if old houses, priories, or abbeys be one's hobby, then Blickling, Hunstanton Hall, or Felbrigg, or Mannington, and at Bacton there are the remains of that old Cluniac priory Bromholm. Of quaint and beautiful churches, with and without relics, there is no end, but it is so true what Ruskin said: "The greatest thing a human soul ever does in this world is to see something and tell what it saw in a plain way." I am too enthusiastic over East Anglia, and I fear I am running away from what I want to talk about—namely, a pleasant drive, which we took in an ordinary car, though really, when I think of the ground we covered and the places we visited, it appears more as if we had sat upon the magic carpet of the Arabian Nights than the now every-day production of a motor-car manufacturer.

We started from where in years gone by some Danes had settled on our coast and named their habitation, probably after their native town, "Kraemmer," or, as we now call it, Cromer, and they certainly showed their good taste in selecting this ideal spot, with the open, blue, and ever free sea in front, and bold, beautiful cliffs on either side. Soon we had passed narrow Jetty Street, and were by the restored Church of St. Peter and Paul, said to have once sheltered Oliver Cromwell's men, and entered the road to Poppyland, the Trimmingham Road. At an old mill, where Clement Scott once stayed, we halted to wander to the cliff. There, right on the edge, is the remaining tower of a church, with graves around and poppies such as can nowhere else be seen, right down to the water. Wherever a slip of earth exists, there they grow. This is the well-known "Garden of Sleep."

On the grass of the cliff, at the edge of the steep,
God planted a garden—a garden of sleep.
'Neath the blue of the sky, in the green of the corn,
It is there that the regal red poppies are born.
Brief days of desire, and long dreams of delight,
They are mine when my Poppyland cometh in sight.

We were very glad that we had left our car at the corner; some other visitors had not cared for the little walk, with the result that they had longer to admire the poppies than even they cared for. The road up to the tower was rough and narrow, and in trying to turn they burst a tyre, and when we came away they were still trying to get a new stiff one on, which even with four tyre levers is not a joke.

The road onward gently ascends past Trimmingham, and from the Beacon Hill, which is over 300 ft. high, a glorious view can be obtained—Yarmouth in front, Norwich Cathedral spire to the right, and it is said that forty churches can be counted from the summit. We did not, however, wait to prove this statement, though we did stop on the way up to look at the church of Trimmingham, chiefly because at one time it possessed a famous relic, said to be the head of John the Baptist. Needless to say the relic is no longer on view, but the church with its unfinished tower is well worth a halt, and the screen, on which are panel paintings of SS. Petronilla, Cecilia, and Clare, is unique. For the next two miles the road is fairly level and bordered with extensive inland views on the right, while not far to the left the sea can be seen and often heard. It may stimulate motorists to take this road when I add that about here many half sovereigns have been found on the shore. And as all automobilists are said to be millionaires, this will interest them, on the principle that those that have much shall get more. Here it was that the poet Cowper lived and wandered when his end was near. The church is worthy of a visit; the tower has been roofed over and is used for service, the nave and chancel being in ruins. From here the road winds towards the land through Paston, the home of an ancient and important Norfolk family, and in the old church, near an altar tomb, a brass records that—

Here Eastimus Paston and Marye his wiffe
Enclosed are in claye,
Which is the resting place of fleache
Until the latter daye.

Another Paston, who was a judge in the time of Henry IV., lies here. A monument by Nathaniel Stone of Katharine Paston, representing a venerable lady richly clad, is worthy of inspection.

Burgham Thorpe.

The road now bends once more towards the coast, and Bacton, with its ruins of Bromholm Priory, is soon reached. They are crumbling away, but most picturesque, with ivy and wild flowers all around. The dormitory and chapter house can be made out, and what remains of the transept of the church is now a farm shed.

Some lie interr'd who
Lov'd the Church so well, and gave so largely to't,
They thought it should have canopied their bones
Till doomsday: but all things have their end;
Churches and cities, which have diseases like to men,
Must have like death that we have.

In the thirteenth century this was a most famous monastery, and possessed a portion of the cross on which Christ suffered, and any sick who approached it came away safe and sound. Capgrave says thirty-nine people were by its means raised from the dead. Another four miles and Happisburgh is reached, and here those keen on geology can spend a happy hour. A post-glacial submarine forest has been found, and in it numerous fossil remains of trees and bones of extinct animals, as well as those of the elephant and hippopotamus. The road can now be followed to Stalham, famous for its reeds, many of the Norfolk churches being thatched with them. If time permits, the Ant broads, Irstead and Barton, should be visited when the sun sets; the view is glorious, wooded on one side, with boat-houses, reed stacks, and old cottages, and the quiet, only broken by the sound of many a wild bird, lends a quaint charm to a unique scene.

A couple of miles of pretty country, and Wroxham is reached, with its comfortable hotel, and I must say that I have never had either as good a lunch or as cheap a one as we had at

church at Hoveton, with its detached embattled tower and the ancient sanctus bell attached to the rood screen. Those who are interested in screens should continue to Ranworth; it is like an illuminated missal, all the detail on the robes of the saints being lifelike and made more pronounced by elaborate flower work. The surrounding scenery, too, is charming, and those searching for plants may find white and yellow water lilies, the flowering rush, yellow iris, arrow head and the water soldier, and at one time many a rosary was made from the burs of the bede sedge, which is most plentiful. From Wroxham a well-wooded road leads by way of Worstead to North Walsham, and a turning to the left near Instead may be taken if it is desired to see another, or rather the remains of another home of the Pastons—Oxnead. Here once lived a Sir Clement Paston, of whom it is recorded:—

A peer of France, in spite of all his betters,
He took in fight, and brought him home in fetters.

This verse referring to a French admiral captured by him, and whom he brought to England and kept until he received "seven thousand crownes in ransome."

Belaugh Church, near Wroxham.

the Kings Arms Hotel there. It was so inviting that we determined to put up for the night and spend the afternoon exploring the Broad in a most comfortable motor-boat which we were lucky enough to be able to hire. Wroxham Broad is a glorious sheet of water crowded with crafts of all sorts. House-boats, motor-launches, wherries, and even Dutch boats, all were to be seen. From Wroxham Bridge we motor-boated along the picturesque Bure to Belaugh, a favourite and popular hunting ground with artists. The church, standing as it does on a steep bank, lends itself, as the accompanying sketch, I trust, shows, to pencil representation. In the church there is a fine brass of a knight in armour and a painted screen, from which some zealous Roundhead has obliterated the faces of the saints. We continued up as far as Coltishall along old Dutch-looking houses and quaint inns, and then stretched our legs by a walk through the home of the broom-tying industry to Tunstead Church, which has an original platform behind its altar said to have been used years ago for the representation of miracle plays. On the south door there are the remains of some pretty ironwork and the colouring of the rood screen is worthy of note. On our return we proceeded to Hoveton Broad to inspect the colonies of black-headed gulls, stopping on the way to see the fourteenth century

North Walsham is a market town chiefly known on account of its church. The porch of squared flint and ashlar bears the arms of John of Gaunt; the carved pulpit and rood screen are worth inspection, as well as the ruins of the tower, which fell in 1835. At the Grammar School Archbishop Tenison and Lord Nelson were partly educated. In the Market Place is a cross built by Bishop Thurlby in 1550, and if the direct road from Oxnead had been taken a mile north of the town, the cross commemorative of the defeat of the "dyer" Littester by Bishop Spencer in 1381 would have been passed.

(To be concluded.)

A USEFUL little device, known as a Spark Locator, for testing the ignition in multi-cylinder engines, has lately been put on the market by the Spark Locator Manufacturing Company, of Imperial Buildings, East Croydon. By means of the Locators, which are attached to the terminal ends of the sparking plugs, the latter can one by one be earthed by swinging the arm of the device down into contact with the base of the plug. In this way a faulty plug can easily be detected, and ignition troubles, either in connection with the accumulator and coil and magneto systems, readily located.

THE Chauffeurs' Commercial Motormen of Manchester is anxious to secure restrictions in the granting of licences to drivers.

AFTER a long inquiry, the bill for the provision of a motor road between Hammersmith and Windsor, with a tramway along the route, has passed the House of Commons Examiner.

In the catalogue of the auction sale of motor-cars held in the garage of Messrs. R. M. Wright and Co., Newland, Lincoln, on Wednesday, we noticed that the names of the previous owners of the various cars offered were given.

THE troubles of the six cars engaged in the New York to Paris run commenced at the very outset of the contest. Mud, ice, floods, snow, and fallen trees appear to be the order of the day. The latest news of the competitors is from Chicago, which city was first reached by the Thomas car.

THE Edinburgh District Board of Lunacy has decided to purchase a motor-car for the use of the medical officer as a substitute for the horse service at Bangour village.

BOOKS of tickets to be used in connection with their motor-cabs are about to be issued by the General Motor Cab Company—a plan that has proved successful in the United States.

THE Tottenham District Council has resolved to ask the Middlesex County Council to take the necessary steps to restrict the speed of motor-cars when passing certain points in the district to ten miles an hour.

FOR a subscription of 5s. per annum the Shropshire Motor Protection Association is insuring the horses, cattle, carts, &c., of members up to £25 against accidents caused by motor-cars on the road.

ASSEMBLYMAN Fowler, of Ulster county, New York, has introduced at Albany a Bill calling for a tax on motor-cars of 50 cents a hundred lbs. This, he suggests, should be utilised for the repair and maintenance of the highways.

THE statistics for 1907, which have just been completed by the Licensed Association of American Motor-Car Manufacturers, show that during last year there were 47,302 petrol pleasure cars manufactured in the United States. During the same period, 5,000 steam and electric pleasure vehicles were built, this giving a total of 52,302 pleasure vehicles turned out in the past twelve months.

Up to the beginning of the present year nearly 1,000 pupils are reported to have passed through the National Motor Academy in the Boundary Road, Notting Hill, W. The new prospectus is very explicit as to the various courses of practical instruction that are given in the lecture room and upon the private track, the teaching comprising the management of tyres, including removing and replacing, the use of spare wheels and quick-change rims, vulcanising, &c., as well as the care of the car. In addition to driving on the track and in traffic daily workshop practice is given—both individually and in class. Those who are trained at this Academy should prove well qualified in any emergency they may have to face on the road.

A NEAT wall card has been issued in the interests of the Cycle and Motor Trades Benevolent Fund, which has now more than £6,000 in hand.

MESSRS. J. FENN WIGGINS AND Co., of Church Stretton, are bringing the Talbot cars to the notice of their numerous clients in Shropshire.

A COMMERCIAL Motor Vehicle Manufacturers' Association has been formed in Chicago. The organisation, which is intended to be national in scope, includes the leading makers of industrial motor vehicles in America.

MR. HARVEY DU CROS, who has resigned from the representation of Hastings in Parliament, was a pioneer of motoring in this country. His son, Mr. Arthur du Cros, is a candidate for the succession to his seat.

There will be many motor-cars at the seaside resort on the day of the election—Tuesday next.

A SUGGESTION has been made that, when the Motor Yacht Club of Ireland visit Lough Erne at the end of July, a motor camp might be established with the assistance of the Irish A.C.

At a meeting of the Romford Ratepayers' Association the subject of the proposed ten miles speed limit for motor-cars passing through the town was considered, and it was suggested that it would be better if danger posts were erected.

MR. M. DAVIES, whose motor works are at Dogpole, Shrewsbury, is undertaking the instruction in motor matters of local folks who obtain cars through his agency. Both at Shrewsbury and at Market Street, Wellington, he has repair shops and garage for the convenience of those who travel that way.

SINCE we wrote last week as to the inspection of the taximeters fixed to London motor-cabs, Mr. Herbert Gladstone has, in the House of Commons, confirmed our information and added the news that where such devices were found inaccurate the matter would be thoroughly investigated by the police.

MESSRS. G. POLKEY, LTD., of Birmingham, have just patented a lens by means of which a

powerful light is obtained directly in front of a car which is not dazzling to other users of the road. This lens consists of two annular rings and paraboloid centre, and gives full concentration, with a divergence of 33 per cent. at a good distance. The side prisms diverge sufficiently to fill up the spaces nearer, giving a full beam of light at a long distance from the car. The glass is composed of special optical mixtures having high refractive powers.

DETAILS of the great Reliability Trial organised by the Motor Union of Western India, from Bombay to Kolhapore and back, are coming to hand. The 40-h.p. Siddeley car entered in Class 5 made a clean non-stop run. In Class 4 the 18-h.p. Siddeley also made a complete non-stop. In Class 2 a 10-h.p. two-cylinder Siddeley gained a prize, and in Class 1 the two 6-h.p. cars made by the Wolseley Company alone completed the Trial. All five cars in the Siddeley team completed the tour.

The Poster of the Cordingley Show.

THE three Itala cars entered for the Grand Prix de France and Grand Prix d'Italie will be fitted with Dunlop tyres.

MR. P. W. ALEXANDER, who has had considerable experience in the motor trade, is about to open a new garage in Waterloo Street, Brighton.

AT the half-yearly meeting of the North London Railway Company, the chairman, Lord Rathmore, said the board attributed £13,000 out of the £18,180 decrease in the passenger traffic to the electric tramcar and the motor-omnibus competition plying between Stamford Hill and Moorgate Street, and Poplar and Bloomsbury.

IN addition to the friction driven auto tyre inflater described in our last issue, Messrs. Maxfield and Co. are supplying a gear driven apparatus for cars, where the flywheel is not accessible. This pattern is also so arranged that it can be put in and out of gear, when required for use, by the flexible cable and lever supplied.

WE illustrate herewith a new compression valve for petrol motors which has just been put on the market by the United Motor Industries. By means of the device, which is known as the Alpha, the amount of compression in an internal combustion engine to which it is applied may be regulated so as not to exceed a predetermined limit when starting the engine. It is so arranged that (when in potential action) any surplus contents of the cylinder above the amount necessary to produce such pre-

determined pressure automatically escape to the outer air. A valve body is provided, one end of which opens direct into the cylinder or is freely connected with the interior of same, and a plug cock near the base of this enables its passage to be opened or closed at will. The body carries an outwardly opening valve normally retained on its seat by a spring; the pressure of this spring, and consequently the lead at which the valve opens, is adjustable by means of a nut on the valve spindle. The plug of the plug cock is in place by spring pressure so as to ensure a tight joint. One of the advantages of the device lies in the fact that an excessive pressure in the cylinder is immediately eased, and shocks caused by back firing are buffered or done away with. A further advantage is that a perfect mixture may be drawn into the cylinder, and is not interfered with beyond that any surplus will at once escape when the valve is in action.

AS we were going to press with our last issue Mr. F. Newton was breaking records with the 60-h.p. Napier on the Brooklands track. The official figures were issued as follows:—50 miles, 35 min. 7.36 sec., or 85.41 m.p.h.; 100 miles, 1 h. 10 min. 20.31 sec., 85.3 m.p.h.; 150 miles, 1 h. 46 min. 6.17 sec., 84.82 m.p.h. One hour, 85 m. 555 yds.; two hours, 169 m. 615.6 yds. On a former occasion, when Tryon went for these records on a Napier, he was stopped owing to a tyre bursting. On the 19th inst. Palmer tyres were used, and these were found equal to the strain set up by the enormous speed. Pratt's spirit was used, and the ignition was the Napier synchronised Castle coil and accumulators.

A SERVICE of motor-buses is about to be inaugurated at Dundee.

MR. E. H. HOLDEN, M.P., has placed an order with the Daimler Company for a 42-h.p. Aston landaulet.

WE hear that His Majesty King Edward has just placed an order for a new Mercedes car of the 1908 45-h.p. type.

THE drivers of the three Weigel cars in the A.C.F. Grand Prix race will be Messrs. Weigel, Pryce Harrison, and Loxen.

MESSRS. DENNIS BROS., LTD., have just received a repeat order for six 30-cwt. motor-vans from Messrs. Harrod's Stores.

FROM the Motor House comes the new number of their Car Review, which, in addition to containing illustrations and descriptions of the vehicles they have for sale, has some notes which give it additional value to those who are fortunate enough to obtain a copy of the same.

THE County Road Board of Aberdeen have had before them a letter from the County Council of Inverness suggesting a conference upon the question of motor-car traffic. It was resolved that Mr. Duff, of Hatton (chairman), and Mr. Marr, with the Aberdeen district road surveyor, should attend the conference.

DURING the inquiry by the Departmental Committee of the Home Office into the provisions made for dealing with cases of accident and sudden illness in the streets of London a full investigation has been made into the electric ambulance service in the city. Sir Kenelm Digby, the chairman, is now, we understand, preparing his draft report.

SOME interesting speed trials with three Coventry-Humber cars—a 10-12-h.p. two-seater, a 15-h.p. four-seater, and a 30-h.p. six-cylinder vehicle having accommodation for five persons—were carried out on the Brooklands track on Tuesday. The cars, which were equipped with Dunlop tyres, were all in touring trim, notwithstanding which the 10-12-h.p. car attained a speed of 37½ miles an hour, the 15-h.p. 46, and the 30-h.p. six-cylinder just over 60 miles an hour.

THE R.A.C. trial of the tyres entered by the R.M. Syndicate for a distance of 1,000 miles was completed last week. The total distance run during the trial was 1,153 miles. Non-stop performances were made on the road each day. There was only one occasion in the motor house on which an adjustment had to be made with regard to the tyres under observation—the near hind wheel was changed for a new one owing to some of the tyre-filling having exuded from the valve.

THE motor mail van running between Southend and Chelmsford was found to be on fire on arrival at Rochford on a recent evening. The outbreak was at first attributed to a lamp inside the van. Many letters and parcels were damaged, but all registered letters were saved intact, and the van was able to proceed after a brief delay. Mr. J. W. Austin, the contractor, is of the opinion that the fire was caused by matches or something of a similar nature in one of the bags.

WE had an opportunity the other day of going over the large new garage which has recently been opened by Messrs. H. J. Chapman and Co., Ltd., at 104, Park Street, Regent's Park, N.W. The premises, which are situated in an excellent centre, are well adapted for their purpose, being electrically lighted and steam-heated. Some idea of their size may be gathered from the fact that there is accommodation for about fifty cars. Suitable plant has been installed to enable all classes of repairs to be carried out to both petrol and steam cars, the long connection of Mr. Chapman with steamers giving him special qualifications in connection with the last-named type of automobile. The work undertaken also includes the repainting of motor-bodies and the modernising of old cars by lengthening the chassis to enable them to accommodate side-entrance bodies; a large stock of spare parts, while three inspection pits are available, as also ample facilities for washing. Another of the firm's branches is that of teaching motor-driving, the teachers being qualified men holding the R.A.C. certificate for mechanical as well as driving proficiency. Messrs. Chapman are also building up a large business in second-hand cars, and at the time of our visit had a varied selection on view ranging from a 6-h.p. Rover to a five-ton lorry.

CONTINENTAL NOTES.

French Motor Imports.

According to a return just issued it is estimated the value of the foreign motor-cars and parts imported into France during last year amounted to £347,320, as compared with £346,600 in 1906.

Motor Racing in Sweden.

The annual motor-car race between Gothenburg and Stockholm, organised by the Swedish Automobile Club, has just been held. The distance between the two places is only 322 miles, but the journey was a difficult one owing to the snow and ice-bound roads over which the cars had to travel. There were only four competitors—Salmson, on a 28-40-h.p. Fiat; Raaf, on a 12-h.p. Star; Janeck, on a 12-14-h.p. Beckmann, and Lindstrom, on a 40-50-h.p. Darracq. All four drivers succeeded in getting through, although Lindstrom was disqualified for some contravention of the rules. Salmson, on the Fiat, proved the winner in 23 h. 42 min. Raaf, on the Star, was second in 27 h. 48 min., and Janeck, on the Beckmann, third, in 34 hours.

German Motor-Car Imports and Exports.

During last year 1,812 pleasure motor-cars and chassis were imported into Germany, their value being given as £847,750. Of industrial motor-vehicles forty-four, valued as £20,700, were imported. The exports of pleasure cars and chassis were 958 in number and £593,750 in value, the corresponding figures for commercial vehicles being 249 and £137,450.

An Exhibition of Agricultural Motors.

The Automobile Club du Centre has decided to hold an exhibition of agricultural motors at Bourges, France, from September 24th to October 4th next. The exhibits will be divided into sixteen classes, and will comprise, amongst others, fixed and portable internal combustion engines, automobile agricultural machines, tractors, &c.

The Austrian Automobile Industry.

With the view of encouraging the development of the automobile industry in Austria, Prince Thurn and Taxis is offering a prize, through the Austrian Automobile Club, of £500 to the home concern which in the next three years shall meet with the

The Motor Union of Western India's Reliability Trials.

The 6-h.p. Wolseley—the winner in the small car class—ascending the Ehandalla Ghat. The native house built in the rocks is worthy of note.

A Motor-Car Race in Russia.

The Moscow section of the Russian Automobile Club is arranging to hold another race from St. Petersburg to Moscow during the coming season. The event, which it is proposed shall be run off on May 31st, will be divided in categories, there being classes for (1) four-cylinder engines between 77 and 105 mm. bore, (2) ditto between 106 mm. and 130 mm., and (3) ditto over 130 mm. The distance to be covered is 425 miles.

Motor-car Racing in Spain.

The Automobile Club of Barcelona is organising a race for light cars for May 28th next. The event, which is known as La Coupe Catalana, will be held on a 28-kilometre circuit, taking in Bajo and Panades, this having to be covered nine times, to give a total distance of 252 kilometres (159 miles).

A Tyre Changing Competition.

A somewhat novel competition for motor-car drivers, with the view of testing their ability to deal with tyre troubles, is being organised by the Automobile Club de la Sarthe, of Le Mans, France, for March 8th. The contest will consist of (1) removing a cover, changing the inner tube and replacing cover; (2), effecting a tyre repair either to the tube or cover; (3), answers to questions relating to tyre troubles and the upkeep of tyres.

greatest success in the various events organised by the Austrian A.C. and other motoring bodies in the country.

Miscellaneous Items.

A lady motor-car driver has just made her appearance in Munich.—It is proposed to organise trials of agricultural motors at St. Quentin (Aisne) and Orleans, France, during the coming summer.—Messrs. Panhard and Levassor have just opened showrooms on their own account in the Champs Elysees, Paris.—The King of Roumania has just ordered his third N.A.G. car.—The Antwerp Automobile Club is organising a 100 kilometre reliability trial for April 5th.—A speed trial on the Medea Hill, near Algiers, was held on Sunday last over a seven and a half mile course. The best time of the day—17 min. 41 sec.—was made by M. Bissonnet on a 20-28-h.p. Clement-Bayard.—The Motor Plug Fabrik Gesellschaft is the name of a company which has just been formed in Berlin to manufacture motor ploughs.—The Automobile Club of Flanders proposes to organise an automobile meeting at Ghent in May next.—Seventeen entries have so far been received for the Tour of France event for motor-cycles and light cars, which is to be held in April next under the auspices of the Autocycle Club of France.—It is reported that Messrs. Charron, Girardot and Voigt are considering the question of establishing a branch factory in Hungary.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

ARE TWO IGNITION SYSTEMS NECESSARY?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have driven a 20-h.p. Dennis car for two years; it is fitted with high-tension magneto and accumulators—quite separate—two sparking plugs in each cylinder. When commencing a journey, I usually start up on the accumulator and immediately switch on to the magneto, of course switching off the accumulators; during the remainder of the day I start on the magneto. I find the accumulators very useful when driving in heavy traffic. I have never had a break-down while running with either ignition; on one occasion, after a stoppage for an hour, the car would not start on the magneto. On examining the latter I found the distributor broken, and as I had not a spare one with me, I should have been landed if I had not had two systems, as I was many miles from home. As it was I started up on accumulators and pursued my journey. I always (except in traffic) run on the magneto, treating the accumulators as an auxiliary ignition, but I have

break some of the gear wheels or nip some of the cardan shaft pins. I began to picture myself looking for the cause in a drenching rain at 2 o'clock in the morning, twenty miles from home, but luckily I had only to touch the switch and away went the engine as merrily as ever. I may say it took some time to find the cause of the trouble, as the next day everything seemed to be right, the motor pulling all right on the magneto for a while, but then started missing. I ran the car on the other system until I found out the cause and put it right. The argument is put forth that there is a tendency to neglect the accumulator system and that when it is wanted it is of no use. Well, that may be with some, but I think it is the exception, not the rule. The practice I generally adopt for keeping both systems in order is to test them every morning by starting up on the accumulator, leaving the engine to run for a short time, then switch over, doing the same. As a rule I always start up on the accumulator; although this is not necessary it keeps the plugs from getting sooted up. There are a few first-

The Start of the New York-Paris Race.

The event, which took place in New York on the 12th inst., attracted an unusually large crowd of spectators, traffic along Broadway being entirely held up.

never found the sparking plugs of either ignition soot up so as to prevent my using them when required.

I quite agree with the opinion expressed by Mr. J. C. Dennis, of Messrs. Dennis Bros., Ltd., and do not regret having gone to the expense of fitting my car with two separate systems of ignition. In my opinion, if two systems are installed, they should be entirely independent of one another.—Yours truly,

T.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would like to state a few facts. For four years I have been almost daily on the road and have driven cars with one and two ignitions. The vehicles with one system were fitted with accumulator and h.t. coil, and I may say I have nearly experienced all the troubles pertaining to this system, but always managed to bring the car home, although not without a lot of worry and a sacrifice of a good deal of precious time. The car I am now driving is fitted with two systems—low tension magneto and accumulator coil—and, if my experience goes for anything, the two ignitions are an absolute necessity if you want to do away with delays and disappointments, especially where there is much station work or the car is used for business.

I remember being many miles from home at a party one very wet night, and on my way home missing set in so badly that the car could not be driven on top on the level and seemed as if it would

class cars in my district with only one system of ignition—low tension magneto—and I have seen them all hauled home through ignition giving out. Had there been a reserve the result would have been otherwise. Many a time I have been told by other chauffeurs that I was lucky to have both ignitions.—Yours truly,

CHAUFFEUR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In accordance with the suggestion of your correspondent "Prestonian," that motor-car owners should give their experience on this subject, I now give mine. I have had a 16-20-h.p. Richard-Brasier car since May, 1905, with low tension ignition only. The engine has never refused to start up once since I got the car, and ninety-eight out of one hundred times on the first turn of the starting handle. The car has done a lot of hard work on Irish roads, and up to now neither the engine nor the magneto have been touched nor a bolt loosened on either.—Yours truly,

TALLY-HO.

HILL CLIMBING IN EDINBURGH.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice the letter of Sir J. H. A. Macdonald in the *M.C.J.* of the 15th inst. objecting to the distance stated by Mr. Percy Richardson to have been travelled by the Sheffield-Simplex on the

steep hill of Frederick Street, Edinburgh, of about one mile in length. Mr. Percy Richardson, not being a resident in Edinburgh, was naturally not aware of the change of name from Frederick Street to Howe Street, from Howe Street to Royal Circus, from Royal Circus to Spring Gardens, from Spring Gardens to Kerr Street, from Kerr Street to Stockbridge. The hill-climb done by Mr. Percy Richardson on his car on top gear was from the level at Stockbridge to the top of Frederick Street, a distance of half a mile. An equally meritorious top gear climb was repeatedly done by the car, viz., turning out of Heriot Row into Frederick Street and immediately beginning the one in thirteen climb between the gardens, and where the car was photographed. This climb was done with Mr. E. Campbell Muir at the wheel, who had never previously driven a Sheffield-Simplex car. I shall have one of these vehicles in Edinburgh in a few weeks, and shall be very pleased to drive Sir John in the car either from Stockbridge or from Heriot Row to the top of Frederick Street, and shall be equally pleased if he will drive the car himself.—Yours truly,

W. E. TOWNSEND.

MOTOR BODY DESIGN.

TO THE EDITOR OF *The Motor-Car Journal*.

Sir,—As the writer of the original letter in your valuable journal on the superiority of the rear entrance tonneau over the side entrance, permit me to sum up the interesting correspondence by a strong reiteration of this conviction—one that requires repetition in view of the spilling of good cars under the supposed idea of "improvement," as illustrated on page 1133 of your last issue.

The following are facts:—(1) In application to a motor chassis the side entrance may be the more recent, yet in point of fact in form it is the older type. It has been pointed out that an ordinary side-entrance body with hood is an almost exact reproduction of an antiquated German Bugle car of the early part of the nineteenth century, while a side-entrance limousine is an undesirable return to an "extra Postwagen" of half a century ago in the German Fatherland. The side-entrance is no wonderful new discovery but a very old type of carriage revived. (2) All the newest corridor continental railway carriage dispense with side-entrances in favour of end entrances. (3) A side-entrance is still more unsuitable to motor-cars. What spectacle does one see at present? Side entrance doors inconveniently hinged in opposite directions on different cars, side entrance doors cut off at lower base in tortured and ludicrous shapes to admit of mud guards, &c., side-entrance doors rattling and not unfrequently flying open en route with disastrous effect! (4) In reply to a courteous letter from one of your correspondents, I am glad to inform him that my experience of side-entrances has been of the very best type and that none of these, landaulet (with its side draughts) or limousine (with its closeness and lowness of height like an obsolete early Victorian railway carriage) can compare, for real comfort during travelling, with a good roomy tonneau. Common sense shows that the curved fronts and rounded corners of the tonneau seats must, in the nature of the case, be more comfortable than the rigid knife board fronted second class railway seat of an ordinary side-entrance. I never pass an old side entrance car on the road without feeling pleased at possessing the more modern tonneau. One who has had great experience of motor-cars observed, a short time back, "Side entrances are just now the vogue, but a good tonneau is, as a matter of fact, ever so much more comfortable." (5) My own tonneau will seat either two or three (with middle-seat down) facing forwards, or four wagonette fashion, two each side, sideways. What side-entrance admits of such adaptability or change of posture? In all these the rear part of the car is equally comfortable, and, even in freezing or windy nights, I have never known a side draught. Look at the object lesson provided on page 1133, and a glance is sufficient to show which of the two can offer the most protection from draught to the rear passengers. Moreover, it is equally easy to see which car by length of wheel-base is most handy in traffic. It is the owners of long side-entrance cars who are now buying second cars with shorter base for London use. As for the swing-seat side-entrance, I believe it to be dangerous in every sense of the word—alike in the imprisonment of the back passengers till the occupant of the swing seat is out, and in the possible injury to the latter by the swinging out of the seat on a curve with fatal result, while the inconvenience of an entrance one side only is manifest at first sight. (6) I repeat my conviction that a motor-car, except for people to whom money is no object and who like to spend petrol in taking heavy luggage by motor, is not a luggage van but a passenger car. Rear luggage weight greatly increases tendency to side-slip, while the same weight on a limousine roof means top-heaviness, as was found out many years ago when, in the early days of railways, the tops of the carriages were used for this purpose, till danger caused discontinuance of the practice. May I say also that I have found my side-baskets neither "dust-catchers" nor "paint-scratchers," but uniquely useful and quite indispensable, as well as smart and workmanlike in appearance. Mine are long, deep, large, and divided into separate compartments for tea utensils, books, clothing, &c. I would not part with their delightful convenience for anything; indeed, I could not do without them. (7) I may here mention as a record of fact that my car has run 10,000 miles without one real puncture or skid; nor has an extinguished tail lamp or splashed number plate involved trouble of any kind with the police.

In conclusion, let me say that the single drawback, if such it may be thought, of a step into the road on entering the tonneau is as nothing

compared to the many practical faults of side-entrances as applied to motor-cars. People are, however, beginning to find these out by sad experience. Only a little time back an illustration appeared in your valuable column, depicting a brand new up-to-date motor-car chosen by a certain Royal Prince and, *mirabile dictu*, it was the supposed obsolete and despised rear-entrance tonneau!

It is because my own experience has shown me how much pleasure in motoring side-entrance passengers lose that I raise my voice of timely warning to all who would thus make a passing fashion and not solid advantage their guide. No old German Bugle car, or "extra Postwagen," dressing itself up in motor guise as so-called up-to-date side-entrance, can for real comfort while actually travelling compare with the really more modern rear entrance tonneau.—Yours truly,

COMMON SENSE.

THE WAYS OF TAXIMETERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad to see that steps are being taken in connection with taximeters to enable the public to place more reliability in their records. I was very much interested in some remarks made the other day by Mr. A. Bailey, the taximeter manager of the Metropolitan Fare Register Company, in the course of which he mentioned that where the public seems to make the most general mistake is in not fully realising that the registering goes on when the car is pulled up for traffic or other cause. Directly the car stops, or the speed falls below six miles an hour, the little clock of the kilo-kilometric system takes up the tale and the fare is registered just the same—only by time.

Another point brought out by the gentleman referred to, and one that may well be remembered by taxi-cab users, is that the meter always registers "in advance." That is to say, at the expiration of the first mile the next twopence is at once shown. But the passenger can always go on, if he choose, until that twopennyworth is nearly exhausted.—Yours truly,

JONATHAN.

Mr. H. P. George, of Oswestry, on his 10-12-h.p. Coventry-Humber. — Mr. George has been using this car for travelling purposes since March last year, since which time he has covered over 15,000 miles, mostly in Wales.

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are sorry that we have offended "Interested Enquirer" by making him an offer of £50 if he could prove that our valve timer was not correct for all engines. He says he started the discussion in the hope of the manufacturers disclosing their methods. He seems to forget that before we entered the discussion he asked for advice on the setting of Panhard engine valves; he was advised by a well-known gentleman, who had tried our setting and found it a success, to try one of our timers. He immediately replied, without testing same, that it was not suitable for all engines, and went on to state instances, which he will not give us an opportunity to verify. We then entered the discussion, and we were prepared to back up our statements with a substantial sum if it could be proved that we were wrong. Surely nothing could be fairer than that. We hardly think it was in the nature of a challenge, it was more of an offer, as he suggests in his last letter, "no cure no pay." Now we are prepared to go further and increase our offer to £100, which sum we will pay to any charity that your correspondent shall name, if he or anyone else will bring to our works two motor-car engines which, when we have set the valves to our standard setting, will not run quieter, slower, and develop more power, than if set or timed by any other method. The test can take place where, and as long as he wishes. Now, can he wish for anything fairer? We can assure him that we do not doubt his word as a gentleman about the instances he has mentioned; what we say is, that he is mistaken.

We take this opportunity of stating that no cure no pay has always been our motto, and we can give the address of dozens of different clients who have had their engines timed to our setting, from a 7-h.p. Panhard to a 40-h.p. De Dietrich (the property of a well-known motorist, Sir A. Macdonald), none of whose cars had ever ran so well as they did when we finished with them. Another well-known gentleman had a two-cylinder Clement (Aster engine) which, before it was timed to our

setting, would not go over a certain hill on its second speed; after it was timed it always went over on its second speed quite easily. Some time afterwards the owner unfortunately had a collision, which necessitated a new engine and gear-box, and, to save time, it was sent to London to be fitted with a new engine, &c. The car was returned, but, do what the owner could, it would not go over the same hill on its second speed; it was brought to our works, for our opinion; we put one of our timers on, and found it a long way out according to our setting; we showed the owner the reading, which he, in the presence of another gentleman, verified. We then said to him, if we cannot, by setting the valves of this engine according to our standard, make the car go up the same hill on its second speed as we did the old one, we will not make any charge for it. We now have this engine in hand, and when it is ready for the road we should be pleased if your correspondent will come and witness that which we have predicted shall come to pass.

—Yours truly,

For Larrad's Patents Syndicate.
H. PULHAM.

STEAM CAR EXPERIENCES WANTED.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would one of your correspondents who has had experience with a Turner-Miesse steam car kindly state if he has found any difficulty in running the same? I should greatly esteem any information, especially from anyone who has run both a petrol and steam car. The antipathy against steam is so strong that it makes an amateur somewhat nervous to venture. I may state I have run a petrol car for over two years.—Yours truly,

AMATEUR.

F. Newton on the 60-h.p. Napier on which he last week established several new records on the Brooklands Track. Mr. S. F. Edge is standing at the side of the car.

A QUESTION OF LIABILITY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I sometimes lend my car to a friend, and I have lately been told that, in case of an accident occurring while in his charge, I should be held liable for damage to property and for compensation for personal injuries. Can any of your readers tell me if this is correct? If so, would an indemnity from my friend be sufficient to safeguard me?—Yours truly,

LAW.

THE TAXATION OF MOTORISTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a motorist of somewhat moderate means I have been rather alarmed at seeing the prominence which the motorist organisations have given to the idea that we should contribute to the cost of the road, and I frankly confess my disfavour of the proposals that have been made. If the spirit of differentiation of the wear and tear of the roads is to be introduced, and the respective destructiveness of the horse and cart and the motor vehicle is to be scientifically ascertained, something further will be wanted to secure equity of taxation. For the man who uses the car in his daily journeys to business, and then throughout the morning and afternoon in calling upon people, is having a far greater use of the roads than the professional person who enjoys a quiet run at the week-end and whose mileage would be considerably less than the regular motorist. Once allow that the basis of taxation as between owners of horse-drawn vehicles and motor vehicles should be according to their respective disintegration of the road surface, and it follows, as a logical sequence, that the man who travels 1,000 miles in a year should only be taxed to the

extent of one fifth of the person who travels 5,000 miles in the same period.

Such idea will be regarded by many as preposterous; but, as one who only uses his cars for the week-ends, I would suggest that we small people should be considered.—Yours truly,

D. E. F.

THE COST OF MOTORING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The appended figures, representing the cost of running a 28-36-h.p. Daimler for twelve months, may be of interest to your readers. The car has a roomy and heavy body. It belongs to a brother-in-law of mine, who has been careful to keep an account of all expenses.

EXPENSES FOR THE YEAR 1907.

(Car ran 8,023 miles).

| Total expenses: | £ | s. | d. |
|--|------|----|----|
| Chauffeur's wages | 127 | 10 | 0 |
| Chauffeur's clothes | 12 | 11 | 6 |
| Licences | 5 | 4 | 0 |
| Re-varnishing car | 13 | 6 | 0 |
| Petrol, oil, &c. | 65 | 18 | 0 |

| Sundries | 2 | 0 | 0 |
| | £333 | 3 | 5 |

—Yours truly,

C. D. LENG.

MR. J. E. HUTTON writes drawing our attention to a mis-statement in the advertisement of Messrs. S. F. Edge, Ltd., in our last issue, to the effect that the fastest time at the Shelsley Walsh Hill Climb was made by a six-cylinder Napier, whereas in effect he made the fastest time on a four-cylinder Berliet, and at the present moment has in his possession the cup presented by the club for the fastest time at the hill climb in question.

WE have also received a letter from Messrs. A. J. Wilson and Company, Ltd., on behalf of Messrs. S. F. Edge, Ltd., stating that the words "Club Competition" should have appeared in conjunction with the reference to the event, as the six-cylinder Napier was not the fastest car in the Open Competition.

MESSRS. CLEMENT TALBOT, LTD., write with regard to a report cable to Australia to the effect that there is a serious slump in the motor industry, asking us to contradict the statement. No Talbot car has ever been shipped to Australia or New Zealand at a lower price than they obtain in this country.

MESSRS. PERRY, THORNTON, AND SCHREIBER, LTD., forward a copy of a letter they have addressed to the Motor Union regretting its severance from the Royal A.C., and suggesting that it should take steps to cover the whole of the ground which was covered in effect by the M.U. when affiliated with the R.A.C., and assert itself as an authority by organizing a reliability contest catering particularly for small cars.

AT Wednesday, Mr. Albert House, of the Oak Lane Garage, Bradford, conducted an auction sale of motor-cars, &c., in that town.

A SYREN (Leclair Patent) has been found near Bagshot, and if the owner will communicate with the secretary of the Automobile Association, Princes Buildings, Coventry Street, W., every assistance will be afforded him.

THE Earl's Court Motor Garage Company, Ltd., Earl's Court Road, London, S.W., inform us that in addition to their agencies for the Standard six-cylinder and the Peugeot cars, they have taken over the sole London agency for the Buick vehicles, under licence from Messrs. Sternberg and Eason. They have also acquired the exclusive selling rights in the United Kingdom for the New Pick 14-16 h.p. cars, which they claim to be the cheapest four cylinder machines on the English market at present. They are British built throughout, fitted with engine of 3½ in. bore 4 in. stroke.

THE ROTAX MOTOR AND CYCLE COMPANY, of 43 and 45, Great Eastern Street, London, E.C., have issued a new catalogue of their motor accessories for 1908. Some idea of its completeness may be gleaned from the fact that the index contains nearly a thousand references. Acetylene, petroleum and electric lamps are fully illustrated and the selection of horns and accessories for the same is equally complete. The Rotax high speed trembler coils have several pages devoted to their good features, one of which is the small consumption of current, and the unusually slight wear on the platinum points. Sparking plugs, jacks, carburettors, general rubber goods and ironmongery for motor body builders, are included in the catalogue as well as Larrad's petrol motor timer, which has recently been the subject of extended reference in the M.C.J.

THE MANCHESTER MOTOR SHOW.

The twelfth annual exhibition organised by the Manchester and District Motor and Cycle Trades Association was opened in Belle Vue, Manchester, on Friday last week by Sir. Wm. H. Bailey. The exhibitors of pleasure cars include the Empress Motor Company, Ltd., Stockport Road, Manchester, who have a new vehicle in an Empress 20-30-h.p. six-cylinder car, the cylinders of which have a bore of 90 mm. by 127 mm. stroke. Several of the Empress standard 16-20-h.p. four-cylinder touring cars are also to be seen. Mr. F. Bullock, of Great Dacie Street, Manchester, displays examples of the latest Star 30-40-h.p. six-cylinder and 16-20-h.p. and 12-14-h.p. four-cylinder and 9-11-h.p. two-cylinder vehicles as well as an 8-h.p. Imperial Starling car. Considerable interest is shown in the 8-h.p. pleasure car and light delivery van exhibited by Messrs. J. A. Wade and Co., Liverpool, the feature of which lies in the ingenious friction drive adopted. The Stella Motor Company, Ltd., through their Manchester agents, Messrs. Ashworth and Wilson, Ltd., have on view the Stella cars, which are the product of a leading Swiss engineering concern. Fig. 1 gives a view of the engine, from which it will be seen that the four cylinders, 90 mm. bore by 120 mm. stroke, are cast in pairs. The carburettor is one of the special features of the vehicle; it is entirely automatic and possesses four separate jets, all actuated by the same lever that controls the throttle, so that one can see, whilst driving, from the position of the lever, exactly how many jets are open at a given time. By means of the multiple jets a correct flow of petrol is insured at all speeds of the engine. Ignition is by low tension magneto. The change-speed gear, which has gate control, gives three speeds forward and a reverse, with direct drive on the top speed through a cardan shaft and bevel gear to the live axle. At this stand are also to be seen the Rapid cars—an 18-h.p. chassis, a 30-h.p. landaulet, and a 70-h.p. racer. Messrs. Norman Crossland, and Co., Deansgate, Manchester, show the Calthorpe cars; Messrs. Jas. Hall and Co. (Manchester), Ltd., the Jackson cars; Messrs. L. F. Harvey and Co., a 12-14-h.p. New Pick two-seated vehicle; Mr. F. Foxwell Gray, an 8-h.p. Phoenix light car.

A strong feature of the show is the large number of industrial vehicles on view. The exhibitors of steam wagons include Messrs. Allchin, Ltd., Northampton; Messrs. Alley and MacLellan, Glasgow; Messrs. Fodens, Ltd., Sandbach, who, in addition to one of their standard vehicles, show a new three-ton wagon with solid rubber tyres; Messrs. Leyland Motors, Ltd., Leyland; Mann's Patent Steam Cart and Wagon Company, Ltd., Leeds; the Yorkshire Patent Steam Wagon Company, Leeds; Messrs. Savage Brothers, Ltd., King's Lynn, and Messrs. D. Stewart and Co. Ltd., Glasgow. The exhibit of Leyland Motors, Ltd., comprises two of their standard steam vehicles, one being a repeat order for Messrs. Greenall, Whitley, Ltd., of St. Helens, for a fourth wagon, and the other for Messrs. Wilcockson Brothers, of Middleton Junction, this making the last named firm's eighth machine. A new feature of the vehicles is the improved form of tube now being used in their vertical type of boiler. With the water in certain localities the

Fig. 1.—The Engine of the Stella 16-20-h.p. Car.

outsides of the steel tubes in the steam space have shown a tendency towards rather rapid corrosion. Copper tubes would overcome the difficulty, but their adoption introduces other defects which more than counterbalance their advantages. The difficulty has been overcome by the introduction of the new tube, which, after a great deal of trouble, Messrs. Leyland Motors have at last succeeded in getting made to suit their requirements. It consists of a solid drawn steel tube covered

with another of copper of 18 gauge. We understand that the tube has been given an extended trial, and has entirely overcome the difficulty which it was designed to meet. Another interesting device seen for the first time on these wagons is Spurrier's patent non-skid, of which we give an illustration in Fig. 2. This consists primarily of an auxiliary rubber block tyre, which can be put on in segments outside the main steel tyre, and is so arranged that the rubber blocks stand slightly above the steel tyre. In practice the auxiliary tyre carries only a small proportion of the total load, and has just sufficient grip upon the road to provide the necessary additional adhesion to enable the vehicle to run on snow and ice-bound roads. The new non-skid has been tried on a Leyland steam wagon by Messrs. G. H. Richards, carriers, of Darwen,

Fig. 2.—Spurrier's Non-skid Device for Industrial Motor Vehicles.

who state that they have been able to make trips over Turton Moor that would otherwise have been impossible, and they give it as their opinion that with a pair of non-skids they would be able to cope with a really heavy fall of snow. The petrol section of the company's productions is represented by a 35-h.p. 3-ton chassis suitable for either a lorry or bus.

Messrs. Walker Bros., of the Pagefield Ironworks, Wigan, show for the first time one of their new two-ton petrol motor lorries. The Lowcock Commercial Motor Co., Gaythorne, Manchester, display a Berna five-ton petrol motor lorry and a Garrett steam tractor, while the Renard Road and Rail Transport Corporation, Ltd., have one of their road trains on view.

In the accessory section a new detachable rim is shown by Turner's Automobile Works, Ltd., Rusholme, Manchester; Fastnut, Ltd., exhibit their "Fastnut" washer, which is now largely used by motor-car manufacturers; the County Chemical Company, Ltd., make a big display of their many specialities, including vulcanizers, accumulators, carbide &c.; the Shrewsbury and Challiner Tyre Company, Ltd., have on view a range of their wheels and tyres, including Challiner's detachable rims, while oils and lubricants are shown by Messrs. Moebius and Son, the Elephant Chemical Company, and Messrs. Marshall and Company, Ltd., Moseley. The show closes to-day (Saturday).

ROAD REPORTS.

OXFORD.—During March and April the portions within the city of the main roads from Oxford to Woodstock, and Oxford to Henley, will be undergoing repair, to be followed by tar painting, if the weather be suitable.

WESTMINSTER.—Dustabaters, Limited, of Hartman Road, Silvertown, E., have recently carried out the treatment of the stretch of road in front of the Houses of Parliament—Palace Yard—the order for the work being given following upon an inspection by the authorities of other roads which had been treated some twelve months or so previously on the same system with satisfactory results.

CROYDON.—Efforts are being made in Croydon to persuade the Corporation to take active steps to secure a restriction of the speed of motor-cars travelling through the borough.

BOSTON, U.S.A.—A mixture of soap-suds, petroleum, and water has been sprinkled on the roads of Boston's park system, and satisfactory results are reported to have been obtained. The road surfaces treated with this mixture required less sprinkling with water than those which had not been treated.

SOUTH SHIELDS.—During the next few weeks the main road from South Shields to Sunderland and the highway from South Shields to Newcastle-on-Tyne will be under repair.

NEWPORT.—The Town Council of Newport, Isle of Wight, has withdrawn the application to the L.G.B. for the issue of a regulation restricting the speed of motor-cars in certain streets in the borough.

THE War Department have ordered two 12-14-h.p. Shamrock cars from Messrs. Sidney Straker and Squire, Ltd.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE first meeting of the Royal A.C. General Committee, constituted under the new scheme for association, was held at the Club House on Wednesday of last week. Eighty-two representatives were present from twenty-eight clubs in all parts of the kingdom. The chair was taken by Mr. C. D. Rose, M.P. A representative Sub-Committee was appointed, the terms of reference to which included the consideration of the best method of working the new scheme.

The secretary reported that twelve clubs, with a total membership of 3,119, had decided to become associated with the Royal A.C., while forty-two, with 2,501 members, had expressed a wish to continue the existing affiliation with the Royal A.C. and the Motor Union during the present year. The first candidates for enrolment as individual associates, numbering 115, were elected.

THE MOTOR UNION.

SIGNED by the Rev. F. W. Hassard-Short, vice-president Cardiff M.C.; Mr. A. Warnery, hon. sec. Southend and District M.C.; and Mr. Herbert R. Mayo, Motor Union representative of Gt. Yarmouth and District Motor Cycle Club, a letter has been sent to the secretaries of the motor-cycling clubs affiliated jointly to the A.C.U. and the M.U. to the effect that:—As you are doubtless aware, the A.C.U. has given notice to the M.U. to terminate agreements, under the terms of the dissolution agreement between the R.A.C. and the M.U. It is, however, not yet certain whether the A.C.U. comes within the scope of this agreement: should it be decided that the A.C.U. does come within the scope of the dissolution agreement, then the severance will take place at once, but if it should be decided that the A.C.U. does not come within the scope of this agreement, then the severance cannot take place until December 31st, 1908, under the terms of the existing working agreement between the A.C.U. and the M.U. We would therefore urge upon the clubs to take no hasty action, but rather to hold the A.C.U. to its existing agreements, until such time as they may have both schemes before them and be able to judge which body they think to be most likely to safeguard their interests.

The chairman of the M.U. has forwarded a letter to the hon. secretary of the North-Eastern A.C., who is acting as hon. secretary of the "Peace" committee, in which he says: "The Motor Union has given very serious attention to the suggestion of the 'Peace' Committee that no further documents should be issued comparing the relative advantages of the R.A.C. and the Motor Union. It is entirely in agreement with the views of your committee on this point, and is most anxious that these recriminations should cease. There is an immense amount of business of the greatest importance to be dealt with, and the Motor Union has no wish to waste its energies in controversial matters which are of no advantage to the movement."

NOTTINGHAMSHIRE.

A SMOKING concert and photographic competition was held on Friday of last week at the headquarters of the Nottingham A.C. at the Black Boy Hotel. This was preceded by a supper. The after proceedings were held in the Welbeck room under the presidency of Mr. A. R. Atkey, and evidenced very great interest, songs being rendered by Messrs. Wm. Downing and Harold Loseby, Mr. W. Ryde being at the piano. The principal event was the photographic competition, members being invited to submit lantern slides for competition in sets of six, which were to be either motoring subjects or views taken while on tour. Nearly a hundred slides were entered, and Mr. Arthur Marshall, F.R.I.B.A., acted as judge. Mr. Booth Granger won the gold medal with a set of slides taken in Lincolnshire and the Isle of Wight, and Mr. A. R. Atkey a silver medal with a set of slides on South Africa. Mr. R. A. Young received honourable mention for a set of slides of church interiors, Mr. A. N. Lee's slides on the Trent Embankment last year were very much appreciated by the members.

LIVERPOOL.

MR. A. L. RATHBONE, J.P., has been elected chairman of the Liverpool Automobile Club for 1908; Mr. W. E. Moss, hon. treasurer; Mr. W. K. Poulson, hon. secretary; and Mr. T. B. Ross, secretary.

Among forthcoming events for next summer, the committee suggest a meet, with possibly a gymkhana, at a site within easy reach of Liverpool; the chairman of the club, Mr. A. Lyle Rathbone, has extended an invitation to the club to a garden party; and a long-standing invitation from Mr. H. S. Higginbottom to enjoy his hospitality will, the committee trust, be possible to accept this year.

DERBY.

THE fifth annual dinner of the Derby and District A.C. took place at the Royal Hotel, Derby, on Thursday of last week, when fifty members and friends were present. The chair was occupied by Mr. Francis A. Bolton (president), and amongst those present were the Mayor (Councillor A. Simpson), Ald. W. Hart, J.P., Mr. Chas. Hardy (president Notts. A.C.), Mr. J. B. Marsden-Smedley, J.P. (Matlock), Dr. W. G. Copestake, Mr. C. H. Guest, Mr. C. J. Allin (hon. treasurer),

Mr. E. H. Fryer (hon. secretary), Mr. Bernard Sadler (Burton), Mr. H. Ross Browne (Nottingham), Mr. Rowland Ford (Utttoxeter), Mr. P. E. Joule (assistant hon. sec.), and others.

After the repeat the toasts were duly honoured, and the Mayor, in proposing "The Derby and District Automobile Club," said that though the committee might be wise in managing the affairs of the club they had for once made a mistake, and that was in putting him down to propose the toast in his name that evening, because he was not an automobilist. He did not possess a motor-car, neither did he ride in one. He had had the opportunity of looking through their rules, and he was astonished to see the benefits and advantages which the club gave to its members at such an extremely small cost. In fact, he felt that no one who possessed an automobile was wise unless he became a member of the club. The other day he wrote, as Mayor of Derby, inviting the Master of Hounds to have a meet in Derby, and he tendered an invitation to the members of the Automobile Club to meet some time during the year.

The President, before acknowledging the toast, presented the cups and medals won last year and then went on to say he was sure he was expressing the feelings of everybody present when he said they cordially appreciated the honour the Mayor had done them by coming amongst them and proposing the toast of their club. They were glad to find that in Derbyshire the magistrates administered the law with a spirit of justice, while the gentlemen at the head of the police did not waste the ratepayers' money by instructing their men to devote the whole of their time sitting about in open stretches waiting for motorists who might exceed the speed limit. The club was growing, the numbers being 174, against 152 a year ago, and their finances were also improving, for the balance now to their credit was £97, against £63 last year. The club was sixth in importance amongst provincial clubs, and nearly all the members owned their own cars. They regretted that their indefatigable hon. secretary (Mr. C. J. Allin) had retired after five years' service, but were glad to know he still took great interest in the club, and that he had taken over the position of treasurer, and Mr. Fryer had taken the secretaryship.

Alderman W. Hart, J.P., next proposed "The Visitors," and on behalf of the members of the club extended a hearty welcome to the ladies and the visitors. He knew the Mayor had a lurking desire to be a motorist, and he hoped that after his pleasant experiences that night he would join the club, and become an ardent motorist. Mr. C. Hardy, president of the Notts A.C., responded, and said it was always a pleasure to him to come amongst the members of the Derby Automobile Club. When they came over to take part in their contests, including the hill climb, they knew they would be treated as sportsmen by sportsmen. They were not troubled in that neighbourhood with police traps on open stretches, and he wished it was the same in other places he knew. They had no objection to police traps in villages and towns, but they had to having them on open roads.

Mr. J. M. Briggs also responded, and on the proposition of Mr. Marsden Smedley a hearty vote of thanks was accorded the chairman for presiding and for his interest in the club.

AUTO-CYCLE UNION.

MR. F. STRAIGHT, secretary of the Auto-Cycle Union, writes to point out that at the recent conferences, representatives of clubs affiliated to the Union, and other clubs proposing to affiliate, showed a very strong feeling that the Auto-Cycle Union should itself do the work which it had hitherto paid the Motor Union to do for it. The Committee of the A.C.U. then pointed out the difficulty which existed owing to the agreement with the Motor Union, but stated that the matter would be brought before the council of the Auto-Cycle Union for consideration at an early date, when various clubs who were then outside the Union had had an opportunity of affiliating to the Auto-Cycle Union and themselves voting on the subject. Before, however, this period was reached, the dissolution between the Royal Automobile Club and the Motor Union gave an opportunity for the Auto-Cycle Union to resume the work which it had delegated to the Motor Union, and the A.C.U. is now prepared to carry out all business affecting the interests of motor cyclists. One incidental result of this is that it is expected the affiliation fee to the Union can be reduced from 2s. 6d. per head (which was necessary when affiliated to the Motor Union) to 2s. per head.

A MOTOR-CYCLE club is being formed for the owners and riders of motor-cycles in Horsham, Henfield, Cowfold, and West Grinstead. Mr. R. Measures, of the latter place, is interesting himself in the matter.

ON Wednesday, at the Harrogate and District A.C., an "impromptu discussion" was held on somewhat novel lines.

MR. A. J. METCALFE will read a paper on the treatment and formation of roads at the Society of Engineers on Monday next.

MESSRS. SPEAR AND JACKSON, LTD., of Aetna Works, Sheffield, who are well known as manufacturers of high-grade tools, have just brought out a new motor tool kit designed to supply, in a handy leather roll, all the small tools likely to be required for roadside repairs or adjustments to motor-cars. The kit, which has been named the "Mermaid," contains twenty tools, the makers having carefully studied every point so as to include all necessary appliances, and at the same time to ensure that they shall be of the highest possible quality and material.

THE ROADWAY SYSTEM OF FRANCE.*

It is generally recognised that the best and most complete road system in the world is to be found in France, where it stands as an enduring monument to the administrative greatness of Napoleon. French roads are good, not because of any superiority of raw materials, as the same materials exist everywhere; they are not good because of any special talent for road building, as the formula was furnished by an Englishman, and some roads just as fine may be seen in parts of the United States. The real superiority of the French highway system is attributable to the fact that it is under the constant intelligent supervision of an army of trained men, who discover within the organisation opportunities for advancement and professional distinction which no mere county administration can offer.

The proof of this assertion may be found in France itself. If the country has a wonderful network of great arteries of general communication called "national routes," there is also in every department or county a system of local roads connecting the small towns and villages, built and maintained by the local governments, and inferior to the national roads. The construction and maintenance of the local roads are affected by the same unfortunate influences which ordinarily attach to county effort in America and other countries, but in less noticeable degree. The French road type is therefore the broad and smooth national route, upon which in rolling country one good draught horse is expected to be able to travel 30 kilometres (18½ miles) per day, hauling a load of 30 cwts. Public opinion requires that the local highways be kept in sufficiently good condition not to interfere with the horse power efficiency here indicated.

The basis of the French highway administrative system is the *École des Ponts et Chaussées* (School of Bridges and Roads), one of the finest technical schools in the world, and, like all other French educational systems of importance, a state affair. It is intended to form the engineers, who afterward take positions in the highway administrative system. Ordinary students also are accepted, and are graduated with the diploma of a civil engineer. The course of study lasts three years, and instruction is gratuitous. The highway hierarchy in France is thus organised:—

- (1) Inspector-general of bridges and highways.
- (2) Chief engineers charged with the work of the single departments or communes.
- (3) Ordinary engineers charged with the work of single arrondissements.
- (4) Under-engineers, who may be compared to non-commissioned officers in the army, the grade being open to "principal conductors," and those who have reached this grade are charged with the work of single arrondissements.
- (5) Principal conductors, charged with the service of the sub-division.
- (6) Ordinary conductors (this category comprises several grades), charged with the service of the sub-division.
- (7) Piqueurs, who are foremen of construction gangs.
- (8) Clerks, employed at headquarters.
- (9) Cantonniers, each having from 4 to 7 kilometres of highway under his immediate supervision.

This vast and apparently complicated machine directs the building and maintenance of both national and local roads. The Government, co-operating with the local authorities under certain circumstances, has charge of the hydraulic works of France—that is to say, the supervision and erection of sea and river walls, ports, etc., and exercises surveillance over rivers and railways.

The point of departure in this system begins with the modest cantonnier, who lives on the line of his jurisdiction, and is responsible for the maintenance of his section of road at all times. He keeps the ditches open, carefully fills holes and ruts with broken stone when such are discovered, removes dust and deposits of sand and earth after heavy rains, trims the trees and bushes, and when citizens furnish labour in payment of their road tax, directs their work. When ordinary work is impossible the cantonnier breaks stone and transports it to points where it is likely to be needed. He is expected to bring to the attention of his chief any condition requiring special attention, and is the man on the spot in every emergency. Each cantonnier has a book, and in this the chief cantonnier, who passes over the road at least once a week, notes his instructions and checks the work accomplished during the preceding interval. Nothing is left to chance. The conductors go over the line at regular intervals also, and direct the chief cantonniers, and all reports are transmitted to the central authorities, who thus follow the prevailing conditions on every foot of national highway in France. Each year the conductors prepare estimates of necessary expenses for the following year, itemising them under the heads of maintenance, heavy repairs, and new work, and the parliamentary appropriations are based upon these carefully-prepared local calculations.

A national route in France, like a railway, must first be declared necessary by a special law. At the present time comparatively few new national routes are being added to a system that is already old and complete. Estimates are prepared when new work is contemplated, and the execution is let by contract. A standard roadway is much simpler than is commonly supposed. Experience has demonstrated that deep foundations and other expensive construction are far less important than a careful drainage system, and in providing this French methods

particularly excel. A standard roadway in France consists of what the engineers call a box, of earth, into which is deposited the hard material of the road surface proper. This "encassement," as it is called, is carefully shaped and rammed, the sides or driftways being wide enough to hold the hard material in place, and incidentally to serve as foot-paths. On each side of the driftway runs a ditch, unless the special conformation of the land renders a ditch unnecessary. In all cases the drainage scheme must be such that the road surface receives only its own rainfall. The ordinary proportions of these standard roads are as follows:—

| Total Roadway. | Two Driftways. ¹ | Road Proper. ² |
|----------------|-----------------------------|---------------------------|
| Feet. | Feet. | Feet. |
| 45.93 | 22.96-26.24 | 19.68-22.96 |
| 39.37 | 19.68 | 19.68 |
| 32.80 | 13.12 | 19.68 |
| 26.24 | 9.84 | 16.40 |
| 22.96 | 6.56 | 16.40 |

¹ Inclination, 1 centimetre (1.3917 inch) per metre (3.28 feet).

² Curvature, one-fiftieth to one-fortieth of width.

The national routes are divided into three classes, having 45.93, 39.37, and 32.80 feet width, respectively. In exceptional cases they are 65.61 feet in width, but only near large cities. Within the road box, when it has been rammed and convexed, is finally deposited the surfacing material of crushed stone, each stone being small enough to pass through a ring of 6 centimetres (2.36 inches) diameter. The depth of the crushed stone, when rolled, should be 20 centimetres (7.87 inches).

Years ago the process was more complex. It was then regarded as necessary to have three strata of material, beginning with a sort of pavement of large stones, upon which was superposed a layer of smaller stones, and a top dressing of crushed stones. Such a road becomes very rough ultimately, and at present a modified macadam system is in use. Whereas Macadam declared his formula to be invariable under

One of the public service vehicles in use between Soussa and Sfax, Tunis.

all conditions, French engineers do not hesitate to employ piles, stones, brush, or anything else requisite to establish a secure foundation, or to slightly increase or decrease the thickness of crushed stone where the soil or conditions present special characteristics.

As every roadway established directly upon a rock foundation is hard, likely to become rough and to wear out rapidly, when such a foundation is necessarily employed a considerable layer of earth is interposed between foundation and surface. The road materials being in place, consolidation of the surface is obtained by rolling with a cylinder of about 6 tons weight. The roadway is sprinkled continuously during this operation and a mixture equal to 10 per cent. of the volume of broken stone, consisting of sandy and clayey material, is thrown under the cylinder. The surfacing operation is limited usually to lengths of 200 to 400 metres (656.16 to 1,312.33 feet) at one time. The steam roller first travels over the moistened loose stones three or four times, after which the fine binding material is distributed in very small quantities, and the rolling then proceeds until a loaded cart leaves no trace upon the new surface. When the rolling is completely finished the highway is closed for about fifteen days in order to dry before being opened to traffic.

The most favourable moment for constructing a highway is at the beginning of spring. The materials most difficult to handle are pebbles and hard, unbroken gravel. When such material is employed there should be no hesitancy in using as much as 12 per cent. of aggregating earth and sand—the maximum prescribed. Broken limestone is most highly regarded for surfacing purposes, after which in the order given comes silicious material, such as quartz, when it is not friable; siliceous and granite when the cost of crushing is not excessive; basaltic material is mixed with limestone, pebbles, and gravel from mines or river beds. Limestone works up most readily, but harder materials, such as siliceous or granite, last longer and give less dust and mud. The best stone for

* Abstract of Report by Mr. R. P. Skinner, U.S. Consul at Marseilles.

road making contains vein stone of calcareous nature, which becomes manifest under compression, and provides much of the hardness and cohesion of the French roads. Applications of hot tar, well worked in with brushes, will aid in prolonging the life of any good road, and to that extent prevent the dust nuisance, often intolerable in these days of automobiles. It should be understood that coal tar baths will avail very little on old worn-out roads, and that dust itself is detritus arising from the disintegration of the road itself. Consequently, the only real remedy for dust affliction is to build roads that are virtually indestructible.

The chief concern in France is that all preliminary and necessary operations shall be thoroughly performed. When embankments are made the earthwork is built up 5.90 to 7.87 inches a time, and the successive strata are levelled, and in the neighbourhood of masonry rammed. Time and rain are given as little to do in the matter of procuring solid construction as possible. Similarly every ditch is very carefully cut at a proper angle, rammed, and if necessary, paved with stones. Every dangerous turn is protected by a stone parapet, and stone posts are planted 1 kilometre apart, with ten smaller stone markers at equal distances between the kilometre stones. At each crossroad there are signposts, always in order, and nowadays (thanks to the Touring Club de France) there are indicators to remind the traveller of dangerous curves, rapid descents, paved drains, and the like. Every railway level crossing is protected by a gate with a watchman in charge night and day.

There are in France 23,656 miles of national roads, which cost £60,795,000 to build. There are also 316,898 miles of local highways, built at a total cost of £61,760,000, of which the state furnished £16,212,000, and the interested localities £45,558,000. These various kinds of roads are classed as follows:—

(1) National routes, traversing several departments and connecting the important centres. (2) Department routes, connecting the important centres of a single department and crossing the national routes. (3) Highways of grand communication, scarcely less important than the previous class. (4) Highways of public interest, traversing a single canton, and connecting with other cantonal roads. (5) Ordinary neighbourhood highways, being narrow and unimportant roads connecting remote villages and groups of houses with the more important means of communication.

The advent of the automobile, with its destructive tyres, has placed increased tasks upon the French roadmakers. No method has yet been discovered of preventing the file-like action of the rubber tyres, often steel shod, upon the road surface. Coal tar baths do some good, especially in keeping down dust, or rather in preventing its formation, but are by no means generally applied, and only in or near centres of population. On the other hand, the permanency of automobile traffic is recognised, and wherever dangers present themselves to this method of circulation, efforts are made to mitigate them, either by directing public attention to their existence, or in mountainous regions by widening the zigzag turns. The destructiveness of the automobile increases in proportion to its speed, but practically no effort is made to limit speed beyond the confines of towns and cottages. The speed evil is correcting itself to some extent, owing to the perils it presents to the occupants of these vehicles.

By virtue of the law of May 30th, 1851, vehicles of all sorts may circulate in France without restriction as to weight of load or width of tyres. However, for police purposes prefects may establish certain rules. Thus, for example, a factory utilising a public road for testing or traffic purposes between given points, and subjecting it to an intense strain, might be required to take out some kind of a licence, or otherwise make up its excessive utilisation of public property. It is a recognised principle, however, that in no case shall agriculture be hampered by any prescriptions in regard to highway transportation tending to interfere with the harvesting, storing, or marketing of crops. Without any regulation by law, tyre widths in this country are greater than in the United States, and under ordinary circumstances have the effect of ironing out the public roads rather than of deteriorating them.

THE GRACILE MOTOR CAR COMPANY, LTD., have removed from 66, Great Russell Street, W.C., to 52, Regent Street, London, W.

AMONG the most recent purchasers of Siddeley cars in India are the Maharaja of Kotah and Nawab Sow Jung of Hyderabad, who have acquired 18-h.p. and 30-h.p. cars respectively from the Calcutta agents of the Wolseley Company.

MR. CHARLES POOSS, of Bournemouth, and Messrs. Hayward and Slade, Ltd., of Winchester, have recently been appointed agents for the county of Hampshire, and Messrs. Norbury, Ltd., of Manchester, have been appointed sole agents for all Asiatic countries for the "Stella" car.

It is not at all uncommon that a brilliant inventor is a very indifferent mechanic, and there can be little doubt that ideas worth thousands of pounds have frequently been abandoned because of their inventor's lack of ability, accommodation or opportunity to make models that would facilitate selecting the best of half-a-dozen pieces of mechanism for the performance of a certain function. Having these facts well in mind, Messrs. Panhard and Levassor have instituted at their Acton Vale works a new department devoted exclusively to the development, modification and general furtherance of inventors' ideas. They are prepared to set to work on an invention in any shape, make drawings or models, putting at the command of the inventor all the resources of a highly-trained and splendidly equipped staff of mechanics.

THE RATING OF PETROL CARS.

A MEMORANDUM by Mr. H. Myddleton Gavey for the Motor Union was submitted to the Chancellor of the Exchequer on this subject, in which he said he did not consider that the rating of the h.p. of petrol engines, for the purpose of taxation, by the measurement of their bore and stroke was a fair or accurate method of estimating this h.p. It would be noticed that almost all manufacturers of motor engines give two rates of h.p. to their engines; the one with the ignition retarded and the supply of petrol cut down to its minimum, and the other with the ignition fully advanced and the throttle fully open. But no manufacturer would undertake to say that under certain conditions he could not get less than the h.p. of the lower figure, or more than the h.p. of the higher figure, so that these figures were to a certain extent arbitrary. Was the petrol car, then, to be taxed on its reputed minimum or its reputed maximum h.p., neither of which was an absolutely stable quantity. Mr. Gavey tabulated the factors which go to increase or decrease the h.p. of a motor engine apart from the dimensions of the cylinder, and they do it to such a large extent as to render this measurement altogether an untrustworthy guide to the h.p. of the car.

Ignition.—(a) Rate of sparking; (b) Intensity of spark. **Coil and accumulator.** **Magneto.** **Carburation.**—(c) Mechanism; (d) Time of day; (e) Altitude; (f) Quality of fuel.

Condition of Engine.—(g) Hot or cold; (h) Age.

(a.) **Rate of Sparking.**—The rate of sparking alters the power of the engine to an incredible amount. As an instance: I was shown a car by a leading manufacturer whose h.p. they asserted to be 28-36; another car had a h.p. of 30-40, and was a hundred pounds more. Why, I asked, a hundred pounds more for an additional two h.p.? The answer was, the 28-36 car develops those powers when running at the rate of 700 explosions a minute, the 30-40 car develops that power when running at the rate of 600 explosions a minute; and we estimate her effective h.p. is twelve h.p. more than the 28-36, instead of two.

(b.) **Intensity of Spark.**—When an accumulator is freshly charged the h.p. of a car is very much greater than when it has been allowed to run down. By putting six volts through the coil instead of four, the power of the car is increased nearly one-third, as I have myself experienced. I have a car fitted with both forms of ignition. When the magneto is switched on, the car is capable of carrying heavier loads up steeper hills than on the coil alone. In addition to this, supposing a car to be running along a straight road on a magneto, and the levers be untouched, the spark will become more rapid and more powerful, and a car which was running at twenty will speedily run up to twenty-five without any alteration having been made, thus indicating an increase of horse power.

(c.) **Mechanism.**—There is no doubt that the mechanism of the carburation varies with the carburettor, and that if the engines of the same bore and stroke were fitted with different carburettors they would attain different results; this being due to the amount of petrol supplied and partly to the way in which it is aerated.

(d.) **Time of Day.**—No one who has driven cars much will deny that they run far better at sundown to the extent of several h.p. than at other times of the day. This no doubt is due to alterations of atmospheric conditions affecting the carburation.

(e.) **Altitude.**—I have a car which at 800 feet above the sea develops fully 5-h.p. more than on the sea-level, and even an altitude of two or three hundred feet produces a marked difference.

(f.) **Quality of Fuel.**—It is obvious that the specific gravity of the fuel used must exercise a considerable difference in the force of the explosions, and therefore the power of the engine.

(g.) **Engine, hot or cold.**—The h.p. of an engine starting cold is considerably under that of an engine which has been running for ten or fifteen miles; this, of course, is due chiefly to the nicer adjustment of the engine when warm, and, to a minor extent, to the more fluid condition of the lubricants.

(h.) **Age.**—The horse power of a car when delivered is not at its maximum, it becomes this when all the parts have worn themselves into their places, and as the car gets older the horse power again falls off, owing to wear and imperfect joints.

From all the above it will be apparent that to tax an engine upon the bore and piston stroke leads one into so many fallacies that this method can only be regarded as giving one quite a rudimentary idea of the power of the engine.

Two useful improvements have recently been embodied in the Napier Triple Air Compressor by Messrs. S. F. Edge (1907), Ltd. In ordinary inflators having pressure gauges the operator has to pump through the gauge at each stroke, thus submitting the gauge to the unnecessary strain of withstanding not only the pressure of air actually in the tyre but also the much greater pressure in the pump connecting tube. In the improved pump this is obviated by insuring that the gauge shall only be in use when it is desired to read the air pressure in the tyre, this being effected by fitting an optional by-pass. The second improvement, which will be appreciated by those motorists who find their tyres difficult to inflate, consists of a little plunger on the end of the brass connecting nipple (which screws on to the tyre valve). Pressure on this plunger drives a small wire rod into the valve and lifts the "dolly" off its seating, and makes a clear passage through the valve.

CASES UNDER THE MOTOR CAR ACT.

HELPING THE IDENTIFICATION OF THE DRIVER.

Mr. E. O. Quick, of Litcomb, Tiverton, Devon, has been summoned by the police, before Mr. Curtis-Bennett, at Westminster Police Court, for failing to give information in his power to lead to the identification of the driver of a motor-car of which he was registered as owner.

Mr. H. Muskett, prosecuting, said the police had been put to an enormous amount of trouble to trace the driver of a car most recklessly driven in the Fulham Road at 12.15 a.m. on December 4th last. The defendant on the 3rd inst. came to London in his car from Southsea with his chauffeur. Police evidence was given that at the time stated the car was driven at the rate of twenty-five miles an hour along a width of 10 ft. of roadway—all the space available consequent on excavation work being in progress. A constable succeeded in taking the number of the vehicle before it dashed off again. The defendant, of whom inquiry was made at his residence in Devonshire, at first gave the name of his chauffeur as the person in charge, but subsequently said he did not know the driver, and that he had misread the particulars as to the time of the complaint.

Mr. Muskett submitted that the defendant had given no information except that which misled everybody, and that his statements and letter were most contradictory.

After a long hearing Mr. Curtis-Bennett said of all the witnesses he had ever come across the defendant was the most unsatisfactory. His mind seemed to be blank about all that was material. There was no doubt in his (the magistrate's) opinion that he had intentionally failed to furnish information, and as he had given everybody so much trouble he would be fined £5 and £15 costs.

A LEGAL POINT IN SCOTLAND.

A judgment of interest to the legal profession has been given at Kilmarnock Sheriff Court by Interim Sheriff Laing. William G. Christie appeared on a charge of contravening the Motor-Car Act, 1903, by having driven a car at a speed exceeding twenty miles an hour on a control between Stanley Burn Bridge and Arran Place, Ardrossan, on January 16th. He made application to the Court for permission to engage an English solicitor from London, an expert in motor-car cases, to conduct his defence. The Sheriff intimated to accused's agent that he refused the application, and stated that his decision was given on two grounds—first, that it was an encroachment on the rights of Scottish solicitors practising in the Sheriff Courts of Scotland; and, second, that it was incompetent for any other than a qualified Scottish solicitor to conduct civil and criminal cases in the Sheriff Courts of Scotland. Accused pleaded not guilty, and was defended by Mr. A. Orr Deas, advocate, Edinburgh. Police evidence showed that the car had travelled over the "control" at a rate of twenty-eight miles an hour. The respondent gave it as his own opinion that he was not going at a speed of more than eight miles an hour, and it was argued on his behalf that it was impossible for the constables about half a mile distant to determine definitely when the car entered upon the control. The charge was found proved, and accused, who had been four times previously convicted, was fined in £15 15s.

£33 was the aggregate of the fines imposed on motorists at Kingston on the 20th inst. On the same day more than £20 was similarly obtained at the Marylebone Court.

COMPANY NEWS.

CLIFTON SPRING WHEEL COMPANY.—Capital, £2,000. To acquire the rights and privileges of Esther Murray, 5, Clifton Place, Glasgow, of and concerning her invention for improvement in wheels of cycles and motors. Registered office, 173, St. Vincent Place, Glasgow.

HENRY'S, LTD.—£1,000. To carry on the business of motor, motor-cycle, and accessory manufacturers, &c. Registered office, 42, Legge Street, Birmingham.

BRITISH MAGNETO COMPANY.—£1,000. Electricians, manufacturers of and agents for electrical apparatus for motor-cars, &c.

E.N.V. MOTOR SYNDICATE.—£4,000. As title.

MANCHESTER MOTOR-CAB COMPANY.—£500. As title.

LIVERPOOL MOTOR-CAB COMPANY.—£500. As title.

PHELON AND MOORE.—£3,000. To take over business of mechanical engineers and motor-cycle manufacturers carried on by J. C. Phelon and R. Moore at Valley Road, Cleckheaton, and elsewhere, as Phelon and Moore. Valley Road, Cleckheaton.

ITALIAN SPARE MOTOR WHEEL.—£40,000. To acquire Italian and other patents of the Stepany Spare Motor Wheel. First directors: T. D. Grimké-Drayton, R. A. Poole (managing director), R. L. Wood, and H. G. Norton. 2, Clarence Parade, Cheltenham.

BRIGHTON AND SOUTH COAST MOTOR CAB COMPANY.—£100. 44, Bedford Row, W.C.

POLICE TRAPS.

RINGMER, on the Lewes-Uckfield road, has its police trap.

THE Portsmouth road has its trap at Surbiton.

A POLICE TRAP is being worked in the Sheen road, Kingston.

ALLEGED OBSTRUCTION AT A BELFAST GARAGE.

In the Belfast Summons Court, Messrs. J. B. Ferguson, Ltd., automobile engineers and motor agents, were summoned for having, as alleged, caused an obstruction in Little Donegall Street by allowing a number of motor-cars to remain outside their works in that thoroughfare. Constable M'Clean deposed that on the 14th inst., while he was on duty in Little Donegall Street, he observed four motor-cars ranged along the street outside the works of Messrs. Ferguson, Ltd. In consequence of the position occupied by their vehicles a wagon which was passing down the street had to cross over to the right side. He spoke to Mr. Ferguson and the cars were removed soon after. Mr. M'Cutcheon, for the defence, said the company viewed the matter in a serious light, because they had always done their best to avoid causing any obstruction. The business in question was started by Mr. Ferguson on the Shankill Road in 1902, and at that time he only employed a couple of workmen; so successful had the undertaking proved that the company now occupied extensive premises and had a large number of hands in their employment. The present premises in Little Donegall Street were acquired in 1904, but the accommodation thus provided soon became too limited, and last year, on a complaint being made as to crowding in the street, extra premises were taken on the Shore Road as a depot and garage for the firm's hiring and second-hand cars, in addition to which premises were also secured in May Street. The company had gone to this expense and trouble with the object of relieving the pressure in their Little Donegall Street works. At the present time they were also erecting, within a stone's throw of that court, a large and commodious establishment, which would involve the expenditure of several thousand pounds, and which would make it unnecessary for any car to stand outside, even if the customer only required a gallon of petrol. He might mention that in other cities progressive industries had actually been driven away in consequence of nagging police prosecutions. Of the four cars in question, two were hiring cars,

A Case of Overheating!

"What are we stopping for, Jimmie?"
"Why, you see, the motor is so hot dat I can't start again till it cools off a little." (Lila.)

which had been brought to the works for a supply of petrol, and the other two were owned by local gentlemen—a doctor and a merchant. None of the four cars had come to the premises for repair.

The Chairman said the magistrate had been considering the matter, and he would throw out a suggestion which might save time. If Mr. Ferguson would pay the costs of the court and give an undertaking to keep the cars in they would not enter any record on the books. Mr. M'Cutcheon expressed his willingness to agree to this on behalf of his clients, but he added that it should be understood that that undertaking would refer only to Mr. Ferguson's own cars, as he had nothing to do with those belonging to customers. The Chairman said if cars remained in the street longer than they ought to do, it would be a matter for Mr. Ferguson to prove that he was not responsible for their being there. The case was then dismissed.

CARS AND THEIR NAMES.

TOUCHING the nomenclature of cars a good tale is going round. A certain local councillor rang up a garage from which he at times hired out a car, when the following conversation ensued:—

LOCAL COUNCILLOR.—"Hullo! I want the car to-morrow."

GARAGE MANAGER.—"I'm sorry, sir, she's not available; there's an M.P.—"

L.C. (indignantly).—"— the M.P.! Ain't my money as good as his?"

G.M.—"—I was saying, sir, there's an M.P. car I can let you have, and which I feel sure you'll be pleased with."

PEUGEOT cars will be shown at the forthcoming Cordingley Exhibition by the Earl's Court Motor Garage Company, Ltd.

FORTHCOMING EVENTS.

MARCH.

- 2nd (M.).—Annual meeting of the private members of the Auto Cycle Club at the Royal A.C., 7.30 p.m.
 5th (Th.).—Paper by Dr. W. Watson at the R.A.C.
 11th (W.).—Annual meeting of the Incorporated Institution of Automobile Engineers.
 11th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 12th (Th.).—Annual meeting of the Royal A.C.
 Annual dinner of the Royal A.C. at the Covent Garden Theatre.
 18th (W.).—Annual dinner of the A.A. at the Hotel Cecil, London.
 19th (Th.).—Monthly meeting of the General Committee of the Motor Union.
 21st (Saturday)—28th (S.).—
CORDINGLEY'S THIRTEENTH INTERNATIONAL MOTOR-CAR EXHIBITION will be held at the Royal Agricultural Hall, London.
 21st (Sat.).—Annual general meeting of the Council of the Auto Cycle Union.
 29th (Sun.).—Opening Run of the Southend Motor Club to the White Hart Hotel, Witham.
 31st (Tu.).—Last day for receiving entries, at ordinary fees, for the International Touring Car Race.

APRIL.

- 11th (Sat.).—Annual open Flexibility Contest of the Crystal Palace A.C.
 16th—20th.—Easter Tour of the Motor Cycling Club.
 17th (Good Friday).—Lincs. M.C.C. meet at Mablethorpe.
 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.
 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F.
 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Epping.

MAY.

- 1st (F.).—The Frome's Hill Climb of the Herefordshire A.C.—provisional.
 10th (Sun.).—Targa Florio Race.
 21st (Th.)—25th.—Reliability Trial of the Irish A.C.
 25th.—Industrial Vehicle Competition of the A.C. de France.
 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
 5th—8th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
 Start of the International Touring Car Trial of the R.A.C.
 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
 15th—19th.—Scottish Reliability Trial.
 27th (Sat.).—Hill climb of the Midland A.C. at Shelsley Walsh.
 28th. (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club.
 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

MACHINE TOOLS FOR MOTOR MANUFACTURERS.

In addition to its cycle and motor-car manufactories, Coventry is rapidly becoming known as a machine tool centre. One or two well-known engineering concerns have been established in the town for some years, while the number has been increased by the formation of the Centaur Motor and Engineering Company, Ltd., whose works are at West Orchard, Coventry. The Centaur Company has, of course, been established in Coventry for about thirty-five years as cycle manufacturers, and their productions in that direction are well known, but the new branch, although under the same capital control, is an entirely separate business. New works have been built, and a well-selected plant of the most modern machinery installed, and the whole has been placed under the management of Mr. A. W. Parkes, until lately with Messrs. Ward and Co., of Birmingham. In framing their programme of production, the new firm have particularly borne in mind the requirements of the motor trade, and propose to specialise upon capstan and turret work to begin with (though doubtless other branches of tool construction will be taken up in due course) and they set themselves a high ideal as regards efficiency and quality, their aim being to produce tools that will take their place in the front rank for design, precision, and durability. The series of capstan lathes above mentioned range in size from a bar capacity of $\frac{1}{4}$ in. diameter to $2\frac{1}{2}$ in. diameter,

through the automatic chuck or $1\frac{1}{2}$ in. when the chuck tube is withdrawn to allow of using a three-jaw chuck on odd work of large capacity with comparatively light tooling operations. No. 2 size, having a hole through the spindle of $2\frac{1}{2}$ in. diameter, is provided with a friction geared head. In this machine, and the larger size, the design permits of offering a good choice of equipments as regard saddles and turrets. Clients can choose between (a) a fixed cut-off rest; (b) a hand operated sliding saddle; and (c) a saddle operated by automatic feed from the change gear-box, and provided with removable leader screws and nuts for screw cutting. Turrets can be furnished either arranged to slide bodily on the bed shears or on a fixed base fastened to the bed. Automatic feeds and change gear-box for varying the same again are optional. The same remarks apply to the largest size, viz., No. 3, taking bars up to $2\frac{1}{2}$ in. diameter. On this lathe, however, the firm have developed a new style of hexagon turret mounted on a cross slide and provided with automatic cross feed, making the lathe exceptionally well adapted for chucking purposes as well as for bar work.

TYRES ON THE TRACK.

A DETERMINING factor in high speed racing is the tyre with which the car is fitted. The recent attempts at record breaking at Brooklands furnish ample evidence in support of this assertion, for on two occasions tyre bursts prevented the drivers (Messrs. Tryon and Jarrott) from attempting more than the fifty miles record set up by Mr. Clifford-Earp on December 10th last. On that date Mr. W. C. Earp, in addition, created the world's records for 100 miles, one and two hours. Palmer cord tyres were used, and Mr. Earp avers that at the conclusion those on the driving wheels had the appearance of never having been used—the edges of the ribs still retaining their original form. On Wednesday week Mr. F. Newton set up the new records given elsewhere in the present issue, and not once during the trials did the tyres give the slightest trouble, and they presented at the conclusion the appearance of having scarcely been used. Some idea of the wearing qualities of Palmer cord tyres will be gathered from the following weights taken before and after the trials:—

| | Start. | Finish. | Loss. |
|------------|---------------|---------------|--------|
| Off front | 30 lbs. 1 oz. | 29 lbs. 3 oz. | 14 oz. |
| Near front | 30 lbs. | 29 lbs. 4 oz. | 12 oz. |
| Off back | 39 lbs. | 37 lbs. | 32 oz. |
| Near back | 39 lbs. 7 oz. | 37 lbs. 8 oz. | 31 oz. |

Before starting for the records, the two driving wheel tyres had run 100 miles on the road and 100 miles on the Brooklands track.

The reliability of cord tyres must assure the motorist that the principle on which they are constructed is scientifically correct, whether they are used for high speed racing or touring.

BUSINESS NEWS.

THE body of the Napier car recently supplied to Captain Hamilton was built by Messrs. H. J. Mulliner and Co., of Bedford Park Works, Chiswick, and not at Northampton.

THE MOTOR HOUSE, of 314-316 and 366-368, Euston Road, N.W., has issued a special bargain list of motor-cars for sale at the beginning of the season.

THE CANADA CYCLE AND MOTOR COMPANY, LTD., Toronto Junction, Ontario, have been appointed Canadian agents for Smith's speed indicators.

THE DUNLOP PNEUMATIC TYRE COMPANY state that they have not received a complaint of the Dunlop rim with regard to the excessive wear of tyres. The secret of this freedom from harm is that the tyre lies in the hollow of a smooth continuous rim, instead of having to chafe against segmental irregularities, joints, studs and breaks in the rim surface, which would wear out any tyre in the course of a few hundred miles running.

THE Benz cars are now being handled in this country by a new concern known as Benz Motors, who are establishing a depot at Portland Court, 160 to 196, Great Portland Street, London, W., where a full range of models of the well-known Benz cars will be on view. Arrangements are being made to have experienced mechanics from the Mannheim works to carry out repairs on both old and new type models of the Benz vehicles, while, in addition, a complete stock of spare parts will be kept on hand.

RECENTLY the Dublin depot of the Sirdar Rubber Company, Ltd., was removed to 6, Harcourt Street. The Glasgow depot of the company is in an equally central position in that city, at 116, North Street. The North of England demand is supplied from 219, Deansgate, Manchester. The machinery at the mills of the company on the banks of the river Avon, at Bradford, Wilts., is of the latest type, securing the efficient construction of both pneumatic and solid tyres by the company, whose head office is at 34, Baker Street, W.

A VAST amount of interest is being created at the premises of the Motor Supply Company, Ltd., 111, Piccadilly, London, W., by the exhibit of a fine representation of the Farman aeroplane in full flight. The company have secured the agency for this machine, and are prepared to supply the aeroplane fitted with Renault, Antoinette or R.E.P. motors. Furthermore, the company state that they are willing to subject the aeroplane to a test of at least one mile in the air, and propose giving to purchasers the necessary advice and instructions, so as to enable clients to use the aeroplanes themselves after a comparatively short practice.

THE Motor-Car Journal.

[VOL. X.]

LONDON, SATURDAY, MARCH 7, 1908.

[No. 470.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

FOR the purpose of differentiating between competitors interested in the motor industry who have at their disposal the resources of factories and numerous workers, and the private individual who has no such resources, the committee of the Brooklands Automobile Racing Club have established a body called "Private Competitors," on the general lines of Gentlemen Riders on the turf.

As it seemed impossible to lay down rules governing all cases, the election of private competitors is subject to the ballot of the Committee, thus enabling each application to be dealt with individually, and the names of all private competitors elected will be published, and the Committee will have power to cancel registration at any time. Races will be arranged for private competitors; these contests will be of a nature that will allow private owners to use their ordinary cars, as the principal object in view is not great speed, but sporting contests suited to all. The principal essentials for eligibility as private competitors are that they have no direct interest in the motor industry, shall not race any vehicle which is the property of anyone connected with the automobile business, and shall receive no remuneration for entering or driving a car.

Naval Motorists.

ONE of the most active of the provincial motoring organisations is the Naval Motor Club, which is establishing its own garages in the various Home Ports. It is intended to ultimately possess a motor house at all the important stations in Great Britain, and hopes are high as to making them entirely self-supporting. Last summer a garage was started at Sheerness; on the 25th inst. a new garage will be opened in Wickham Street, Portsmouth, and a scheme for the establishment of a similar house at Portland will be brought out shortly. The head-quarters of the Naval Motor Club are at Portsmouth, and a proposal for putting the automobiles of members at the service of the Admiralty in case of war is being drawn up by the club.

The Exhibition.

A FORTNIGHT from to-day (Saturday), Cordingley's thirteenth International Motor-Car Exhibition will open its doors at the Agricultural Hall, London, and, judging from the interest already aroused, should prove highly useful to manufacturers and agents in opening the 1908 season with a good fillip for business. As before, social interests will be a strong feature. On the Thursday the Ladies' Automobile Club will hold what has come to be regarded as an annual re-union, when the ladies interested in motoring take advantage of the occasion to inspect the latest models of cars and the newest inventions in accessories. The Motor Union, too, which will hold its annual meeting in London on the 25th inst., will be largely represented, and in the current issue of the "R.A.C. Journal" the Motor Union notes drew attention to the fact that "the annual meeting of the M.U. falls during the exhibition week, thus rendering it possible for provincial members to combine attendance at this

gathering with a visit to the exhibition." The Automobile Association will also have an office at the exhibition where full information as to its system of working will be obtainable, and many of the engineering societies and associations are also paying official visits to the Agricultural Hall. These features will do much to ensure a repetition of past successes.

Interested Students.

ONE of the incidental impressions gained from behind the scenes in connection with the exhibition is the active desire on the part of those responsible for technical automobile instruction at the various engineering colleges and polytechnics throughout the country to secure the attendance of their pupils at the forthcoming display. Year by year this interest has been growing, and from many important provincial centres, as well as from all the London institutions that have become associated with the educational side of the movement, groups of students headed by their instructors are coming to the Show. The diffusion of knowledge thus secured cannot fail to be of ultimate advantage to the whole of the industry.

An Appeal to Mr. Burns.

SOME may have forgotten that last year a conference of road authorities was held, at which a committee was appointed to keep watch over the proceedings of other people in their advocacy of various road questions. This met a few days ago and resolved to approach the Local Government Board with a series of suggestions of a technical, as distinct from a purely financial, character. Among the road obstructions to be deprecated to Mr. John Burns are electric standards, tramway standards, lamp-posts, conveniences, monuments, and other obstructions in the centre of the highway (except refuges necessary for foot passengers), as such erections endanger the public safety and materially reduce the traffic capacity of the highway. Proposals for comprehensive experiments with regard to the mitigation of the dust nuisance are also to be laid before the representative of the Government.

The Proposed Motor Road.

WE have always urged that it is impolitic to suggest that special roadways should be constructed for the particular and exclusive convenience of motorists. The great highways should be adapted to the purposes of locomotion. That is a principle dictated by a common-sense consideration of the case, and not by any prejudiced view. Otherwise, if speed is to be limited by bad roads, invention may be discouraged and the general welfare be thwarted. Consequently the proposed motor road has not aroused any enthusiasm among motorists. It has, however, succeeded in arousing an expensive and general opposition—disagreement being shown in public meetings in the districts which would be affected, and in petitions numerous signed by those who are opposed to such a sectional view of traffic contingencies. Now the London Council's Parliamentary Committee has recommended opposition on the broad principle as to whether the construction of roads of such a character should be sanctioned at all. They point out that "it may be urged, on the one hand, that this would be reverting

to the old system of turnpike roads long since abandoned, and that such a road being in its nature more like a railway would tend to check the development of the country through which it passes. On the other hand, such a road would undoubtedly prove of benefit in relieving the ordinary roads of a class of traffic which does the greatest amount of damage to them. It would also tend to save dwellers near the existing roads from the nuisance of dust and the depreciation of their property caused by motor traffic." Arguments will probably range between those two schools of opinion.

What is Suggested.

IN the meantime, it will be useful to set out the details of the London Motor Roadways Approach Bill, 1908, which is being promoted by the Roads Construction Company, Ltd., for the construction of the new roadway in the counties of London, Middlesex, and Buckingham for motor traffic. The roadway would commence at Wood Lane, Hammersmith, and, passing to the south of the Council's housing estate at Old Oak Common, Acton, would terminate at Eton by a junction with the Bath road, and would be about fourteen miles long. There

Mr. Peter Crook, of Newlands, Birkdale, Southport, at the wheel of his Dennis 35-h.p. Limousine.

is also proposed a new road, about a mile in length, from Latimer Road to Wood Lane, to lead on to the main motor road at Wood Lane. From inquiries the committee have made it appears that it is intended that the shorter road shall be a public road, open to traffic in the usual way, but the main road is intended for motor-vehicles only. The width of the main road is to be about 40 ft. and that of the shorter road 60 ft.

Things that Matter.

ELSEWHERE we give a synopsis of the paper which Mr. Mervyn O'Gorman read at the R.A.C. a few evenings ago. In the course of the discussion, Mr. G. M. Baillie gave his view that nearly all the paper pointed to the great necessity of shock absorbers. The greatest movement of the springs was always got after the car had met the object that gave the movement, and it was just that movement that the shock absorbers would prevent. Mr. J. Lyons Sampson referred to the loss in transmission, as to which he had been making a series of experiments. He had been trying experiments with a pair of gear wheels $\frac{1}{2}$ in. pitch, $\frac{3}{4}$ in. long on the tooth, and he loaded them with the pressure that they would have in practice. He found that with a pressure of 200 lb. on the teeth there was 10 per

cent. loss, and, increasing that pressure through to 500 lb., that loss came down to half that figure, or slightly over 5 per cent. At the 200 lbs. it would be under the same conditions as when developing 5-h.p., and at 500 lbs. it would be under the same conditions as when developing 12-h.p. He had not yet had time to complete those experiments as fully as he would like, but he thought that so far they showed a smaller loss than that gear was generally credited with. They knew that the loss was on the teeth only. The wheels in question were mounted on spindles set in five centres. Referring to the life of tyres, Mr. S. F. Edge said it depended more upon the stopping ideas of the driver than upon everything else, for they might give him everything possible, "but all was nullified by the fool who wanted to stop in one yard when he ought to take 300."

Friendly Authorities.

"PREVENTION is better than cure" is an axiom of proved value, and one upon which the Bridges and Roads Committee of the Kent County Council places some importance. The attention of that body having been called to the fact that some motorists have driven carelessly through its area, it is now seeking to restrain the ardour of enthusiastic speed merchants. Instead of setting traps to catch the careful and the careless alike, the committee has got into communication with the Automobile Association, as representing a large number of motorists, with the view of warning drivers of automobiles of the danger occasioned by the thoughtless driving of vehicles. Mr. W. B. Prosser, the clerk to the County Council, writing to the Automobile Association, points out that "in many cases when meeting horse-drawn traffic the motorist, instead of keeping to the near side of the road, keeps in the middle of the road, and thus drives straight at the approaching horses until within a few yards of them, causing the animals to be terrorised, and, in the opinion of the committee, such driving is fraught with considerable risk to the travelling public." Those who have familiarity with the road will agree as to the risks incidental to such a practice, which can only be indulged in by a purblind minority of those who motor.

The Kent C.C. and the A.A.

THE reply addressed to the Kentish authorities by Mr. Stenson Cooke on behalf of his Association should satisfy everyone as to the good work that can be effected through organisation, and, incidentally, should attract those who are not yet affiliated to any of the great motoring societies into one or other of them. Should the Kent County Council consider it necessary the A.A. will station one or two of their patrols at specially dangerous parts of the roads in Kent, for the purpose of regulating the speed of motor traffic, thus proving the contention that the Association's policy is really conducive to a proper observance of the law by those who use the highway. We may mention that the A.A. has already spent considerable sums on the employment of special patrols between London and Folkestone, particularly in the vicinity of Ashford, where the efforts of their men to repress inconsiderate or excessive speed have been keenly appreciated by local residents and the police alike.

A Trio of Dismissals.

THERE was much magisterial discomfiture at Grantham on Saturday, when the Spittlegate J.P.'s appeared to hear cases against three motorists for exceeding the legal limit on the Great North Road. Mr. Staplee Firth quickly detected a flaw in the indictment, and rightly urged the point for all it was worth, with the consequent dismissal of the summonses. The point, however, to which we would direct attention is concerned with the costly nature of such matters. For, although there was a readiness to grant a dismissal, the defending solicitor evidently thought it was useless to occupy time in asking for costs. If affairs were equitably conducted,

costs in such cases would be borne by the police, whose careless-
ness was, in the cases mentioned elsewhere in the present issue,
the cause of expense to others.

The Road Question.

ROADS continue to be the subject of discussion by learned societies, and on Monday the Society of Engineers had the advantage of a paper by Mr. A. J. Metcalfe. It dealt with the treatment and formation of road surfaces, and in introducing the subject the author referred briefly to motor-car construction, how it should be amended to mitigate the dust nuisance, then indicated several of the difficulties retarding the improvement of road surfaces, the intolerable conditions caused by dust, and the unsuitability of present-day roads for present-day needs. The Roads Improvements Association's recent tests and trials were discussed, and Mr. Metcalfe considered (a) palliatives, such as westrumite, akonia, calcium chloride; (b) preparations partly composed of tar or oil, such as crempoid, ermenite, hahnite, pulvicide, and emulsifix; and (c) preparations chiefly composed of tar, such as tar compo, marbit, dustabato, solidified tar, oil of tar, and tarvia, and a short description of

wish to drive with moderation will find that comparatively high powered cars will not entail any more expense. The point is an exceedingly valuable one, and will doubtless be raised by prospective motorists who call into the motor showrooms during the next few weeks. Another interesting comparison furnished by Mr. Jane has reference to the upkeep cost of a 10-14-h.p. car of 1903 and a 30-h.p. motor vehicle of last year's type. In the former case, 19.5 miles were run per gallon; in the latter 13.84. The speeds up a certain hill were 11½ m.p.h. and 28½ m.p.h. respectively. During six months with the earlier car there were eleven engine stops and none with the 1907 vehicle. Equally noteworthy was the behaviour of the tyres. In 1903 the worst cover ran for 2,056 miles, and the best 3,728; last year the mileages were 2,551 and 3,625 miles respectively.

The Taxation of Cars.

FOLLOWING the letters published last week concerning the probability of a revision of the present system of the taxation of automobiles, comes a further sheaf of communications from many leaders of the movement. Men like Sir David Salomons, Lieut.-Colonel Mark Mayhew, Mr. Dugald Clerk,

The Dowager Queen Margherita of Italy in her 40-h.p. Fiat Landulet.

[Allgemeine Automobil Zeitung.]

each mixture or material was given, together with their respective properties, actions, methods of application, cost, &c. In conclusion, the author maintained that the chief hindrance to the improvement of road surfaces was a financial one.

Motor Upkeep.

THERE are some controversies which seem interminable. Like Cromwell as a subject for discussion at debating societies, they present an ever present theme about which both wise and unwise things can be said and written. Unless embroidered with facts and figures, such debates lead to nowhere—a fact which has probably warned Mr. F. T. Jane to wander into tabular proof in his article in the current "World's Work" on the "Costs of Motor Upkeep." He was attracted to the idea that a small car can be maintained at a comparatively less expenditure than one of higher—though not necessarily greatly so—power. There was a theory as to a 12-16-h.p. car being fairly reasonable as regards upkeep, but that a vehicle of more than 20-h.p. meant more than double the expense of the first-named. Having put the problem to a practical and statistical test, he has come to the conclusion that "the theory about low-power meaning economy is all moonshine," and that those who

Mr. G. T. Langridge—to mention but a representative quartette of our correspondents—have done so much to foster the motor-car in this country that their views are likely to weigh well with other motorists throughout the country. Suggestions as to the basis of any new taxation are as varied as the weather, and that the point already raised as to the comparative use of the roads by motorists of different degrees is receiving attention is apparent from our correspondence. Unhappily the difficulties in the way of securing accuracy with regard to the consumption of petrol, the price of the chassis and other factors mentioned as the starting-point for revenue-raising are almost insurmountable.

The Irish Trials.

IN our issue of the 22nd ult., we published the itinerary of the Irish Reliability Trials, to be held from May 21st to 26th of the present year. On another page we give some of the leading points of interest in the regulations, copies of which can be obtained from the secretary of the Irish A.C. in Dublin. In addition to awards for the general excellence of performance, the Goff perpetual challenge cup for team competition will also be in the list of awards.

The Taxation of Motor Cars.

LAST week's references to this subject have called forth a large amount of correspondence, from which the letters given below will be of general interest.

Following the deputation to the Chancellor of the Exchequer the general committee of the Motor Union are now circulating a petition for the signatures of all interested in the prosperity of the roads and the advance of automobilism. This is worded as follows:—

Petition to the Prime Minister, the Chancellor of the Exchequer, the President of the Local Government Board, and the other members of His Majesty's Government. The petition of the undersigned sheweth—

(1) That there has been a large increase in the traffic on the main roads of the United Kingdom during recent years in consequence of the growth of the population and the introduction of new methods of road locomotion, such as bicycles and motor-cars.

(2) That there is a large demand from all classes of the population for an improvement in the highways which are in the care of local authorities whose revenues, mainly derived from local sources, do not enable them to spend the money necessary to maintain the roads in a satisfactory and dustless condition without placing an undue burden on the local rates.

Your petitioners, therefore, pray that all moneys derived from the taxation of motor and other vehicles using the roads shall be paid into a central fund and distributed as grants-in-aid to local authorities for the purpose of expenditure on the highways of the country.

Name.

Address.

The following table shows side by side with the present scale of taxation the scale proposed by the Royal Commission and also by the Motor Union.

| Vehicle. | Present Taxation. | Taxation proposed by | |
|--|-------------------|----------------------|--|
| | £ s. d. | Royal Commission. | Motor Union. |
| Motor-bicycles weighing less than 2 cwt. | 15 0 | 1 0 0 | 7 6 |
| Motor-cycles weighing 2 cwt. and less than 7 cwt. | 15 0 | 1 0 0 | 15 0 |
| Motor-cars up to 12 cwt. unladen | 2 2 0 | 2 2 0 | 1 10 0 |
| Motor-cars exceeding 12 cwt. and up to 15 cwt. | 2 2 0 | 3 3 0 | 2 0 0 |
| Motor-cars exceeding 15 cwt. and up to 20 cwt. | 2 2 0 | 5 5 0 | 3 0 0 |
| Motor-cars exceeding 20 cwt. and up to 25 cwt. | 4 4 0 | 5 5 0 | 4 0 0 |
| Motor-cars exceeding 25 cwt. and above (commercial vehicles excepted)... | 4 4 0 | 8 8 0 | 6 0 0 up to 30 cwt. and £2 for every additional 5 cwt. |

An examination of this table will show that the Motor Union ask for a reduction upon the taxes paid by the users of small powered motor vehicles.

Sir David Salomon, Bart., will always have a distinguished position among those who brought the automobile into prominence in the latter "red flag" days, for it was at an agricultural show near his place at Tunbridge that some cars from France opened British eyes as to the possibilities of the ungainly travelling machine of those days. His views should, therefore, have considerable interest for the great number of motorists who are following the discussion now going on in our columns. Writing what Sir David calls "a hasty line" from Paris, he thus condenses his view:—"1, I consider taxation enough now, and it should go to the repair of the roads; 2, cars do less harm than horses, except, of course, when fitted with studded tyres in wet weather; 3, hence a payment of 5s. per studded tyre might be added to the present taxes; 4, a reduction might be made to those who have many cars, since all are not in use at one time. In nine out of ten cases, for instance, a man may have a large, a small, a closed and an open car; 5, I should suggest that beyond

two cars, fifty per cent. reduction on the others should be allowed from all taxes. The first two cars to be fully taxed should be the largest ones, to avoid unfairness to the State."

One of the most novel suggestions we have received from readers is that from Sir Charles McLaren, Bart., M.P., who writes:—"In my opinion motor users ought to pay for the use of the main roads, which are largely kept up for their advantage, and the money ought to be applied to the improvement of these roads. I consider that the fairest tax that could be imposed would be a duty on petrol. In this way the payment to the Exchequer would be proportionate to the actual usage of the road."

Sir Edgar Boehm, Bart., who has motored in many parts of the world, is very "averse to the taxation of motor vehicles." From personal knowledge gained while on a motor tour in Austria-Hungary and the Tyrol he is able to add that "in Austria, where taxation is carried to a great extent, the effects both on the industry and on owners are beginning to tell in a disastrous way, and it would become just the same over here."

Lieut.-Col. Mark Mayhew was not only the founder of the Army Motor Reserve, but is head of an important industrial firm, and was one of the early leaders in the industrial as well as in the pleasure and military side of the motor movement. In his view "I do not think the idea of taxing motor-cars according to their power and weight is at all unreasonable, but such a tax should be certainly accompanied by an undertaking on the part of the Government that all the money obtained by it was strictly allocated to the main roads of the country."

Mr. Edward Kennard, J.P., who was one of the adventurous motorists taking part in the historic 1,000 mile trial, has strong views with regard to the increased taxation of vehicles. Already the way in which the present law is administered, with the expensive and vexatious risks that have to be run, compel him to seek the pleasure of travel in France, and the possibility of further exactions is apparently not to his taste. Referring to what we have already said on this subject, he writes:—"You ask for the opinion of motorists on the Highway Robbery Bill shortly to come before Parliament. Compared with similar sources of revenue, the motor tax as it stands is sufficiently onerous; its increase spells extortion. With equal wisdom the Chancellor of the Exchequer might propose to put £1 per ton on all yachts, or treble the duties on horse-drawn vehicles! If our pockets are to be lightened by the Dick Turpins of Downing Street, their ill-gotten gains should certainly be devoted to road maintenance, although it is the traction engines that are responsible, and not rubber-shod motor-cars, for any injury to our thoroughfares. Every year I am exiled to France to enjoy the pleasures of motoring, free from the vexatious and frivolous restraints we have to endure at the hands of our nervous legislators."

Mr. G. T. Langridge was for some years the Chairman of the Motor Union, and gave valuable evidence before the Royal Commission. He writes us:—"I have been a motorist, driving myself, for nearly ten years, and am in favour of a moderate increase in present taxation, say, on the lines recommended by the Royal Commission, but such increase to be applied as that Commission recommended, viz., to the upkeep and improvement of the roads. Taxation on locomotion as a help to Imperial revenue is obviously wrong in principle. Horse-power on the crude R.A.C. formula would be an unfortunate basis for taxation, as it must tend to an undesirable type of fast-running engine. I see Mr. Asquith thinks the weight basis has not proved a success so far, but with a proper definition this would be satisfactory. At present no one really knows how the weight is to be taken, hence few owners know within a few cwt. the running weight of their cars. From a series of exhaustive tests and observations over all kinds of roads in all weathers I am convinced that weight is the primary cause of road

damage, and that the non-skid stud, which in many districts is absolutely indispensable, when on such a flexible base as a pneumatic tyre is being unduly blamed by many eminent authorities. Had the present enormous increase of traffic not been self-propelled or carried on anything but rubber or studded rubber tyres the bulk of our road surfaces, as made by our present 2,000 English road authorities, would have become by this time to a great extent impassable."

Mr. Dugald Clerk, M.I.C.E., the well-known authority on internal combustion engines, was a judge at the 1900 motor trials, and has closely followed the technical advance of the industry, both before and since that date. He writes:—"It is always annoying to pay taxes of any kind, but undoubtedly the business of the country could not be carried on without them. If more money is really required by the Chancellor of the Exchequer, it is quite just that the burden should be placed upon those best able to bear it; and I, as owner of a rather heavy car, will not object to pay my share. There is a strong case, however, against further taxation of the light motor-car used by doctors and professional men and the commercial car used for business purposes. Extra taxation on such cars should be strenuously resisted on the ground that it is bad for the country at large to restrict a new and growing industry or to render the means of rapid locomotion more expensive than they ought to be. Any such restriction must operate against the general welfare of the country."

Major J. Bennett-Stanford, who has driven cars over some thousands of miles, is of the opinion "that motorists should pay very much bigger taxes on their cars to the Imperial Exchequer, and that the Imperial Exchequer should hand over to the County Councils a moiety of the sum raised in accordance with the number of miles of main roads there are in that county. I think that traction engines, which one constantly finds pulling five or six heavy trucks behind them, and which do an enormous amount of damage to our high roads, should be very heavily taxed. I also think that motor-cars should pay a sovereign per h.p. annually. I should not be in favour of any reduction being made to business firms, who are never satisfied with any percentage under 25 per annum; nor medical men, who generally charge two guineas for telling one nothing."

Mr. Tonman Mosley, J.P., the chairman of the North Staffordshire Railway Co., and whose experience at the Buckinghamshire County Council gives his views added value, is in favour of the nationalisation of all main roads, and also of the taxation of motor-cars up to 2 tons weight by h.p. On this point he writes:—"I see no reason why the taxation of cars should not be adjusted by horse-power up to 2 tons weight, and above that by weight alone. Height of clearance between road surface and axle should also be considered, as the dust nuisance is intensified by the low build of ordinary cars."

Lieut. M. J. Tuchmann, of the Army Motor Reserve, was one of the earliest enthusiasts for motor-cycling, and believes:—"My own opinion is that motor-cars and cycles are already sufficiently taxed, but that, if further taxation is unavoidable, it should be on the basis of weight, as it is the heavy cars which do damage to the roads, more especially when fitted with steel studded tyres and driven at excessive speeds. Light cars and motor-cycles should be exempt. I am strongly in favour of a central board for the control and upkeep of the national highways, and all taxes imposed on motor vehicles should be devoted to road improvement."

Mr. Ernest Estcourt was one of the first gentlemen of Norfolk to take to motoring, and was a pioneer of motor-boating on the Broads. "Although I am aware," he says, "that there is a difficulty in getting at the horse-power, yet it is a difficulty that, in my opinion, could be got over quite near enough for the purpose of taxation. I think horse-power much fairer than weight. A tax on tyres with an extra tax on steel-studded non-skids would be extremely fair. Weight is, in my opinion, most unfair. Fancy the present owners of our old 6-h.p. Daimlers paying on 23 cwt. and the owner of a 20-h.p. to 25-h.p. modern car getting off under the ton."

(Several letters are held over till next week.)

A NOVEL PETROL METER.

AN interesting and useful instrument, by which the amount of petrol used on a car can be accurately registered, has been put upon the market by the Donisthorpe Patents Company, of 5, Southampton Street, Strand, London, W.C. The device, which is known as the Donisthorpe petrol meter, indicates precisely how much petrol goes into the tank, how much is used each mile of the journey, and how much remains at the journey's end. The mechanism consists of a sheet metal rotary drum revolving on a steel spindle. The drum has four divisions, drawn radially, making four compartments, each having a capacity of one quarter of a pint. In each of the compartments there is a longitudinal float held by two rigid arms made of hard-rolled metal. On the extreme end of the arms there is a clutch, which protrudes beyond the circumference of the drum, viz., in the compartment which is uppermost, while across the frame there is a steel spindle, which arrests the drum after it has discharged the liquid from the loaded compartment. The action of the meter is as follows:—The liquid falls into the

uppermost compartment; the buoyancy of the float is so adjusted that it is capable of acting against the weight of the liquid which raises it; also against the friction which is caused by the stop. As the float rises the clutch leaves the stop, and as the drum is adjusted so that the centre of gravity falls within a certain point, the momentum is always given to the drum in one direction. As the drum revolves the next clutch comes into position and meets the stop just as the former compartment discharges its contents. To prevent any backward motion of the drum a ratchet and pawl device is provided on the spindle on which the drum revolves. The mechanism is contained in a rectangular metal case, which can be fitted on to any existing tank, and having in the glass-enclosed front three dials with small pointers, like those of a gas meter. The lower dial registers in $\frac{1}{4}$ pints up to 8 pints, the upper right hand dial by $\frac{1}{4}$ gallons up to 10 gallons, and the upper left dial registers up to 100 gallons, and then repeats. The petrol is passed in at the top through a funnel in the ordinary way, and falls into the small rotary drum referred to. Altogether the meter is an ingenious device and should prove a useful addition to the equipment of a car, enabling as it does a check to be kept on the fuel consumption.

A JAUNT IN NORFOLK.

(Continued from page 10.)

A PRETTY route back to Cromer is by Gunton, with its glorious park, and then through Roughton; but, if time permits, there is a fine cross road that passes Felmingham and Aylsham, and so Blickling may be reached. Blickling Hall is a fine moated old brick mansion, with rows of clipped yew and lime trees flanking it in front on either side. Here Anne Boleyn lived, and it is said that Henry VIII. married her privately in the adjoining chapel. The rustics say that on the anniversary of her execution she revisits her home, dressed in white, with her severed head in her hand, in a carriage driven by headless flunkies, and drawn by similarly mutilated horses. In the Hall there are two wooden statues, one of Queen Elizabeth, the other of Anne Boleyn. The library contains a Coverdale Bible, and some of the portraits would alone repay for a balt, especially Lord and Lady Buckinghamshire by Gainsborough, and Reynolds's Queen Charlotte. In the grounds there are some fountains and statues which were brought from Oxnead. On leaving, the turning on the left should be taken to Wolterton, the seat of the Earl of Orford, and once the residence of Rubens's famous "Rainbow" landscape. An avenue of cedars attracts attention, and, still keeping to by-roads, Wickmere is reached; here a turning to the left leads to Barningham, and so to Edgefield, and thus by Barney to Fakenham, the town to which William the Lion, King of Scotland, brought the Lord of Galloway to make his submission to Henry II. The river Wensum, with a mill, and the reflection in it of the surrounding trees, is most picturesque. A good road leads to the Walsinghams, the old on one side, the new on the other, of the Stifkey. The streets are narrow and probably little changed since the time when pilgrims crowded the town to pray at the shrine of "Our Lady of Walsingham." The remains of the Priory are entered through an Early Perpendicular gateway, and portions of the guest hall and refectory can be made out; parts of the dormitory are included in the present owner's house. The shrine was probably in a chapel that was destroyed after the Dissolution. Erasmus, who visited the shrine, describes how pilgrims were admitted through a narrow wooden door, and that at the feet of the Virgin was a toad, indicating her victory over all evil, and that she was surrounded and covered all over with jewels, gold and silver. He was, I am afraid, rather a sceptic, as, on being shown the joint of one of St. Peter's fingers, he drily remarked, "Peter must have been a man of a very large size." A legend exists that the chapel was first put up near the Wishing Wells, and that it was removed by the Virgin herself to the site it eventually occupied. The wells still exist, one square and two circular, with a margin of stone, and the single wish of the drinker is supposed to be always gratified. Henry VIII. walked barefooted there to pray for his child who was ill. A turning on the left leads to Creak, where there are some interesting remains of an Abbey founded by Edward III.

If time permits, a stop should be made on the way at South Creak, where a sharp turning to the right is taken. Here the church contains an Easter sepulchre and a fine brass. Three miles northwards is Burnham Thorpe, the birthplace of Nelson. His father was the rector of this parish, but the rectory where the hero was born has been pulled down. Most people seem to go to the old church where so many of his relatives are interred, and the church is certainly worthy of a visit. The register can

be seen with his signature as a witness, as well as the old font in which he was baptised. The lectern is made of wood obtained from the old "Victory." The brook or "burn" is very pretty, and in the summer on its banks some beautiful forget-me-nots grow, and when pressed make an excellent souvenir of the trip. On leaving here for the first time my faithful car started to suggest that she was tired, she seemed suddenly to feel our weight, and to "pull badly" and moan loudly. An inspection revealed that one of the exhaust valve tappets had bent and slipped out of its guide, so that the exhaust did not open; that cylinder was asking the other one, not only to do her work, but also to pull her over compression. The tappet had bent and fallen out. It was soon found, and, a smith being handy, it did not take long to heat it, put it in a vice and straighten it. Five minutes after it was in position and we were turning to the left and in the park of the Earl of Leicester—Holkham. Once this was an open, barren country, producing on an average but five shillings an acre, but Mr. Coke changed this by ploughing, turnip growing, irrigation, and spotting the sandy waste land with pieces of sward; abundant crops of wheat and barley cover the land, and where but a few sheep and oxen could be fed thousands now are to be found. He even saw the launch of a ship built of oak from

The Cross at North Walsham.

acorns planted by himself. The Leicester monument commemorates his work; it is a lofty column, surmounted by a wheat-sheaf, and in the bas reliefs at the corners are shown a plough, an ox, a drill, and a sheep. The park contains some fine deer and is well wooded; the evergreen oak is prominent, and some of the specimens are over 12 ft. in circumference. Lady Leicester's flower garden is beautiful, and, if possible, permission should be obtained to walk through the grounds, by the lake, to the house. Kent built the mansion in 1744, and the whole is certainly vast and stately, but the bedrooms are somewhat out of proportion. As Walpole states, we are left to conjecture "whether the host and hostess sleep in a room 40 ft. high, or, like their guests, are relegated to a garret or an outhouse."

The hall, with a surrounding gallery on three sides, is a noble room. In it is a statue of the mother

of Nero. The drapery, part of which has been retouched, is most beautiful. A bas relief of William IV. signing the Reform Bill is worthy of inspection, containing, as it does, portraits of Thomas Coke and Lord Grey. In the north dining-room a colossal marble bust, found in the harbour of Nettuno, should be seen, as well as the Watteau tapestry in the red-and-yellow bedroom. Those who are interested in art will linger in the brown dressing-room. Here is a copy of Michael Angelo's "Call to Arms." This was executed in competition with Leonardo da Vinci for the great hall of a Florentine palace. It is a marvellous work and shows his knowledge of anatomy and foreshortening. The men are bathing in the river when news comes of a sudden attack by the Pisans; the various men, old and young, are hastening from the Arno to arm themselves, and the attitudes and forms are more than life-like. One can imagine that this artist carried out that celebrated "Last Judgment" in the Sistine Chapel; the men remind one of the boatman Charon and that portrait of Paul the Third's master of the ceremonies, who had offended him, and who as a punishment he represents as the judge Minos. Some of the ancient sculptures in the statue gallery must be seen, one of Neptune, of Parian marble, is of very good workmanship, as well as the Apollo and Venus. The drapery of the latter is a perfect model of Greek art. Those interested in landscapes will find

in the drawing room some of Claude's best works, as well as Poussin's poetical representation of a storm. In the saloon is a copy of Rubens's "Flight to Egypt," the original of which is at Blenheim. Among many other works worthy of inspection are Paul Veronese's Mary Magdalene anointing the feet of Christ, and Leonardo da Vinci's Head of Christ; these are in the northern state room, and in the state bedroom's closet there is an admirably painted Polyphemus, seated on a rock, and trying by his performance on a reed pipe to gain the love of Galatea, who is shown with two Nereids on the sea. There is, too, a carving of two woodcocks, said to have been killed by one shot by Chantrey when staying at Holkham. The feat is recorded by Mr. Hudson Gurney in this epigram:—

Driven from the north, that would have starv'd them,
This is the way that Chantrey sav'd them,
He shot them first, and then he carved them.

We spent longer than we intended over this marvellous collection of art treasures, and so decided to stay at Hunstanton, where we found an excellent hotel. On our way thither we passed the old Roman station of Branodurum. In the fourth century a large garrison was stationed here, and, if old stones could talk, many a yarn of pirates driven off would be revealed. It was to this town that the Old Peddar's way led, and in those days doubtlessly many officers on leave galloped by that road to the gay and festive Colchester, perhaps to hear an Atellane play, as the modern Policinello was then called, or, what most likely appealed more to the rude soldiery, that entertainment introduced by Laberius and known as the "Mimes," and which I am sure our modern county councils would not have licensed, but would have deemed that form of mimicry as bad as living statuary.

Hunstanton is a very pretty old place. On the cliff there are some remains of a chapel, said to have been founded by Edmund of East Anglia after his rescue when his ship was wrecked on the coast. The old church contains many tombs of the Lestrangle family, who for over eight hundred years have been owners of the manor, an interesting fifteenth century moated quadrangular house. The breeze along the cliffs is most exhilarating, and made one think of these lines:—

The wind has a language I would I could learn,
Sometimes 'tis soothing, and sometimes 'tis stern,
Sometimes it comes like a low, sweet song,
And all things grow calm, as the sound floats along.

To one's imagination it seemed to tell of a period when excursionists were not, and when gigantic forests stretched across the Wash and prehistoric man maybe lived here in caves and with stone implements hunted wild beasts.

A good road leads through Heacham—famous as the home of the Rolles, one of whom emigrated to Virginia and contracted a romantic marriage with Princess Pocahontas—to Snettisham, over Ken Hill, and then on to Dersingham. After reaching this village the first turning on the left should be taken, and after passing the Early Perpendicular church, the second turning on the left leads to Sandringham House, through heath land. On Wednesdays, during the summer, when the King is not in residence, the public, on obtaining an order from the estate office, are admitted to the grounds. The main entrance is guarded by wrought iron gates, which were exhibited at the London International Exhibition of 1862, and were presented to the then Prince of Wales by the county. They are, indeed, a masterpiece of wrought iron. The public are admitted by the east gate. The stables are interesting. A dark chestnut named Empress, and a black cob called Violet, as well as two bays, Faithful Boy and Bay Lad, especially attracted us, motorists though we were. The motor sheds are close to their rivals, but are not shown to the public. The house is Elizabethan in style; the west front overlooks an ideal Italian garden, with grassy slopes, little paths, and flower beds set with stone baskets. Passing along the path, the canine cemetery is reached, where, close to a sundial, rest some of Her Majesty's favourite dogs. Further on is a stream, spanned by a rustic bridge resting on quaint boulders, and in a little valley we saw a most picturesque waterfall and whirlpool. The path can be continued past York-

House, the residence of the Prince of Wales, and beyond are the kennels, famous for their Clumber spaniels and Great Dane. If time permits, the Ammer road should be followed.

(To be concluded.)

THE TOURAND CARBURETTOR.

WE illustrate herewith a very interesting form of automatic carburettor which has recently been put on the market by Messrs. A. Tourand and Co., of Rue de Longchamp, Suresnes, Paris. As will be seen, a feature of the jet is that not only does it project at an angle into the vaporising chamber, but that it is provided with a needle valve, adjustable from the exterior, which, while it forms a spraying cone, also serves to regulate the amount of petrol permitted to pass out of the jet. This regulation once attained may be either fixed by means of a lock-nut, or the lever actuating it may be connected up to the dashboard to permit the petrol supply to be varied *en route* to allow for the exigencies of the roads over which the car is travelling. The main air inlet is arranged at right angles to the

jet; it is of a pre-determined size, narrowing towards the spraying nozzle, with the result that the air is drawn violently past the latter, the makers claiming that even when the engine is running slowly the motion is always sufficient to ensure good carburation. In the upper part of the device is the automatically-controlled extra air inlet, this being, as will be observed, provided with means of adjusting the tension of the valve-spring. When the motor runs fast it tends to create a vacuum throughout the whole of the carburettor, with the result that the automatic valve is drawn down, and a certain quantity of air admitted to the mixture formed in the vaporising chamber. The latter, which is provided with a throttle valve of the piston type, is also furnished with a hot-water jacket which renders the use of an extension of the main air inlet pipe to a point near the exhaust pipe unnecessary. A plug is fitted at the lower part of the jacket to allow the water to be drawn off in frosty weather. The petrol inlet to the float chamber, in which latter the level of the spirit is maintained at a few millimetres higher than the top of the jet, is provided with a filtering gauze, and is so arranged that it can be readily detached for cleaning purposes. The Tourand carburettor, which is being made in three sizes for engines of respectively 10 to 30-h.p., 35 to 60-h.p., and 65 to 100-h.p., is claimed to enable an engine to be run at speeds varying between very wide limits, that it instantly responds to any variation in the position of the throttle valve, and that it is extremely economical in petrol.

CONTINENTAL NOTES.

The International Congress on Roads.

It has been decided that the International Congress on Roads, initiated by M. Barthou, the French Minister of Public Works, shall be held in Paris during the week commencing October 11th next. The subjects to be discussed are divided into two main groups:—(1) Those dealing with the construction and maintenance, and (2), The effect of different classes of traffic, road signs, &c. In connection with the Congress, full particulars of which can be obtained from the Secrétariat général du 1er Congrès International de la Route, au Ministère des Travaux Publics, 24, boulevard Saint-Germain, Paris, an exhibition of material and machinery appertaining to roads is also to be held.

The A.C.F. Grand Prix Race.

Some particulars of the new cars which are being built for the A.C.F. Grand Prix race in July next are beginning to leak out. The Panhard racers will be of approximately 125-h.p.; the four-cylinder engines having a bore and stroke of 155 mm. by 170 mm. The cylinders are separately cast with copper

last, which only attained a value of £260,680, as compared with £363,360 in the first month of last year, and £427,680 in January, 1906.

Automobilism in Roumania.

The first motor-car was introduced into Roumania in 1889, and for several years it was the only car in the country. In 1895 three more were bought by private individuals, but until 1903 there was not any large increase in the use of motor-cars. Since then the number has steadily increased, eighty-three being imported in 1906, and eighty-eight in 1907. Not only the post office, but nearly all the Government departments make use of motor-cars for the national service, while in the recent manoeuvres there was utilised for the first time a corps of motor vehicles belonging to officers of the Reserve, which were requisitioned by the military authorities and which proved of great service.

Motor Cabs in Italy.

A company has just been formed in Rome to introduce a service of motor-cabs in the city. It is stated that a commencement will be made with twenty vehicles of the Brixia-Züst type

Motoring in Florida under Difficulties.

The American Automobile Association has sanctioned a 360 miles road race from Jacksonville to Miami, in Florida, to be held in the second week of March. A number of cars, including the "Cleveland" depicted above, recently started from Jacksonville to lay out the route through the swamps and everglades, over ground which the wheels of a car have never previously passed. The road, as far as Rock Ledge, has been traversed by a White steam car, but, beyond that point, there is a wilderness of cane-brake, swamp and sand, the illustration depicting a "pathfinding" vehicle on one of the many sand barrens.

water jackets. Perhaps the most noteworthy feature of the 1908 Panhard racing cars is the transmission, which will be by side chains in place of the cardan shaft system that has been employed by the firm during the past year or so. The racing cars which the Motobloc Company are building will be fitted with four-cylinder engines having a bore of 155 mm.; it has not yet been decided whether to adopt a stroke of 170 mm. or 180 mm. As in the standard cars, the flywheel will be carried between the two pairs of cylinders, while the engine base chamber is directly connected up to the gear-box. High tension magneto ignition will be relied upon; the change-speed gear will give four speeds forward and a reverse, and the final transmission will be by side chains.

French Motor-Car Exports.

The reports with regard to dulness in the French automobile industry, which have recently been current, are borne out by the returns which have just been issued with regard to the exports of motor-cars and parts from France during January

Miscellaneous Items.

The municipal authorities of Amsterdam have lately put in service a 24-h.p. Bussing motor lorry. It is intended for use in connection with the thawing of snow, the vehicle being fitted with a tank for the distribution of a concentrated brine solution. —A motor ambulance is shortly to be placed in service in Nuremberg, Germany. The body will be fitted to an Adler 30-h.p. chassis. —It is announced that at the completion of the heavy vehicle trials in May next the French Minister of War intends to place orders for a large number of motor lorries. —M. Lepin, the Chief of Police of Paris, has given orders for steps to be taken to prosecute motor-cyclists running their engines with free exhaust, or in any way that tends to frighten horses. —A new motor-bus service is being started between Levallois and Neuilly, near Paris. —The annual hill climbing competition for motor-cycles and light cars up Mont Cenis, Italy, is to be held on August 16th next. —Senor El Marques de Valladares, of Madrid, has purchased a Daimler 48-h.p. "Rugby" phaeton with Cape cart hood and glass screen.

A LARGE showroom has been opened on the Cowbridge Road, Cardiff, by Mr. John Norman, who is also fitting up a motor-car repair shop.

THE City of London Corporation has instructed its law officers to report on the powers of the local authorities and the police with regard to motor-'bus traffic.

At the annual dinner of the Essex County A.C. Mr. Burnett Tabrum, J.P., said that fewer licences to motor-car drivers were issued in the county in 1907 than in 1906.

At the half-yearly meeting of the Didcot, Newbury, and Southampton Railway Company, the chairman lamented the way in which their revenue had suffered in consequence of motor-cars, particularly in the neighbourhood of Newbury.

A PURREY 5-ton steam wagon, belonging to a mining company in Algeria, has been requisitioned by the French military authorities for transport service between Turenne, Valla Marguis and Oujda, in connection with the Morocco campaign.

THE Committee of the Liverpool A.C. have made an arrangement with Messrs. Chapman, Von Sobbe and Co., of Mulberry Street, Liverpool, at the request of the Automobile Club of America, to attend to the landing, clearing of Customs, storing, &c., of cars arriving at the Port of Liverpool from America, on a settled scale of charges.

MR. C. DOUGLAS PRATT, who has previously been associated with important concerns both as makers of cars and garage proprietors, has now opened a fully-equipped garage in the main Coventry road, Warwick. Motorists journeying through the Midlands will find Messrs. Pratt and Co. willing and able to be of assistance at all hours of the day or night.

THE automobile race meeting on the Ormond-Daytona beach, Florida, commenced on Tuesday with a 100-mile race for the Minneapolis cup. There were only three starters—Cedrine on a 60-h.p. Fiat, Blakely on a 130-h.p. Christie, and Shefts on a 120-h.p. Hotchkiss. The contest was won by Cedrine, who covered the 100 miles in 1 hr. 50 min. 20 sec.

THE Avon India Rubber Company, Ltd., of Melksham, Wilts., have just issued a new catalogue of the Avon motor tyres, which are steadily growing in popularity. The list not only gives full particulars and prices of the studded, square and round tread tyres, but includes several pages devoted to the care of tyres. The Avon Company are also devoting attention to the repair of damaged covers and tubes.

ON the main road from Horncastle to Kirkstead, at Woodhall Spa, Mr. W. A. Dickinson has a finely-equipped garage with accommodation for fifty cars, and large stocks of tyres, spare parts, motor spirit, and everything that the motorist is likely to require. He has had a long practical acquaintance with the motor industry, and was the first motorist in the town of Woodhall Spa. His establishment is in the Broadway.

In the Commons, Mr. Sinclair, answering Mr. Cathcart Wason, has said that applications for a speed limit on motor-cars had been received since the Act came into force on January 1st, 1904, from seventy-five Local Authorities in Scotland, and in twenty-eight cases orders had been made, while in twenty-seven cases the application had been refused, withdrawn, or allowed to lapse, and twenty cases were at present under consideration.

LUBRICATION is one of "the things that matter," not only in the efficiency and economy of the car, but also in the appreciation it receives from the general public. In the early days the oil used by motorists was scarcely considered; now the most amateurish recognise the important part it plays. Recently that known as "Ilo" has commanded attention on its merits. The trio of letters is an abbreviation of International Lubricating Oil, and briefly express the high grade oil which Messrs. Easton and Melville, Ltd., of 85, Shaftesbury Avenue, W.C., are placing before motorists, after a series of tests which have demonstrated its exceptionally high flash point and uniform viscosity. The Ilo oil is prepared in light, medium, and heavy consistencies, and a series of tests to which it has lately been submitted have proved its excellence over several rivals.

MR. H. WARD has taken premises at 24, Portmanmoor Road, Cardiff, which he intends to devote to the purposes of a motor repair shop.

A MOTOR-CAR that recently escaped a police "control" at

Kingston was trapped in an innocent-looking water splash near Ambercoul, East Molesey.

MESSRS. SPENCER BROS., LTD., report a large entry in the aeronautical section of the Cordingley Motor Show at the Agricultural Hall, London, at the end of the month. Airships, aeroplanes, balloons, kites and motors for aerial work are amongst the most interesting features of the display.

As briefly recorded in our last issue, a noteworthy series of records was accomplished on the Brooklands track on Tuesday last week by a group of Humber cars. There have been many records accomplished at Brooklands, but always either with specially built racing cars or by what are technically known as "stripped" vehicles, that is, chassis from which all the ordinary body has been taken off, and in other ways specially prepared for the test. In this instance, however, there was no such special preparation, each of the Humbers being ordinary standard cars, with complete bodies exactly as sold to the public. More-

The Coventry-Humber 30-h.p. Six Cylinder Vehicle which last week attained a speed of sixty miles per hour on Brooklands Track.

over, allowance must be made for the weather conditions. The gale which lasted over the week end prevented anything in the nature of trial spins at speed, and thereby made the test an even closer approach to anything that can be accomplished by an ordinary amateur driver of his own Humber under similar conditions. The team consisted of the principal makes of Coventry-Humber vehicles, the 10-12-h.p., the 15-h.p., and the 30-h.p. six-cylinder. The times of each of these, as officially certified, were as follows:—10-12-h.p., 37½ miles per hour; 15-h.p., 46½ miles per hour; 30-h.p., 60 miles per hour.

MESSRS. CROCKART, of Blairgowrie, who have been in the motor business for the past six years, have plans prepared for a new garage in that town. The building will be 128 ft. by 41 ft.; skilled motor mechanics will be employed, and a full stock of spares, oils, and tyres will be kept. They intend having cars for hire.

THE dangers of tram-cars were demonstrated the other day in Croydon, when no less than three trams met with accidents. In Norbury a car collided with a baker's van. Later, the same car, being driven by another driver, collided with a milk cart. In the Selhurst Road a car had a collision with a traction engine, and both were slightly damaged. Later, another car met with an accident near Selhurst Station, colliding with a pantechicon. Had the motor-car thus been running amok "Constant Reader" would have written to the papers.

Two petrol motor fire engines have just been ordered for the London Fire Brigade.

A NEW motor depot has been opened in Dublin—at 29 and 30, Dawson Street—by Mr. W. B. Crawford.

A LOCAL estimate records 6,000 automobiles as passing through Croydon on their way south on Sundays.

THE Daimler Company have received an order from Captain R. Dundas Orr, of Carron Hall, Stirlingshire, through the Ross-leigh, Ltd., Glasgow, for a 58-h.p. Hazlewood phaeton.

OWING to the bad condition of the roadway between Shepherd's Bush and Wormwood Scrubs, the motor-bus service between those points has been temporarily withdrawn.

MESSRS. TAMPLIN AND MAKOVSKI, LTD., have a well-fitted garage in Bell Street, Reigate, and are making a special feature of the repair of tyres by the H. F. vulcanizing process.

FROM the Coventry Motor Fittings Company, of Far Gosford Street, Coventry, comes their new catalogue of radiators, lubricators, and other specialities for the motor trade. Petrol filters and gauges occupy several pages of one of the most interesting catalogues of this kind that we have lately received.

The handsome State Landau built, and now being shipped, by Fiat Motors, Ltd., to the order of His Highness the Maharajah Scindia of Gwalior, Central India.

The car, the bodywork of which is by Messrs. Maythorn and Son, of Biggleswade, is painted a medium green, elaborately ornamented in gold, the interior being upholstered in dark leather, and having seating accommodation for six persons. As indicating the unusual proportions of the vehicle it may be mentioned that the wheelbase measures 12 ft. 9½ in., the overall length being 17 ft. The chassis is a 20-25-h.p. Fiat, the frame being specially constructed both as regards length and strength.

MR. J. J. KEATING has recently extended his motor garage in Dublin, and at the present time building operations are in progress at the rear of his premises in Lower Abbey Street, where he is fitting up a complete garage and repair shop.

MESSRS. SELIG, SONNENTHAL AND CO., 85, Queen Victoria Street, London, E.C., are introducing a handy little tool to facilitate the fixing of motor chains by drawing the ends of the chain together more quickly and easily than by hand. The spanner, which can readily be carried in the tool box, will deal with chains from 1 in. to 2 in. pitch.

A NEW vulcanising fluid, to which the name "Grip" has been given, has recently been put on the market by the South Western Motor and Rubber Company, Kew Gardens, S.W., for use in connection with tyre repairs, either to tubes or covers. The fluid is a secret preparation—the result of many years' experience in the general handling of rubber of all kinds. It is easily applied, and, while it effects a firm and immovable jointing, does not injure the rubber of the tubes. The fluid is also recommended for effecting repairs to waterproof clothing, &c.

WE hear that a well-known British firm of industrial motor vehicle builders are at present negotiating a large order of mail vans for service in St. Petersburg, Moscow and Kiev.

THE judges' report of the commercial vehicles trials of the R.A.C., together with the medals and trophies, are being presented on Friday, the 6th, at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W. Mr. C. D. Rose will preside over the proceedings, which will commence at 4 p.m.

WE learn from the London and Parisian Motor Company, Ltd., that the Hotchkiss new model 16-20-h.p. car is rapidly meeting with favour in motoring circles. As we can testify from a short run we had on one of them the other day, not only is the car extremely quiet, but the engine, which has all four cylinders in one casting, is exceedingly flexible, the way the car slowly picked its way through the crowded traffic of the West-end, on its top gear, creating an excellent impression on our minds.

AT the annual meeting of the shareholders of Crossley Bros., Ltd., at Manchester, Mr. W. J. Crossley said they had just built and equipped one of the most modern works for the motor car business, and the machinery in this important extension is about to be started. Not only had they fitted up the most modern machinery, but they had secured the services of experts in motor-car construction. Arrangements had also been made to build light delivery vans and other vehicles of that character.

A NEW detachable wheel for use on motor-cars has just been introduced by the Coventry Motor Wheel Company, of Spon Street, Coventry. The wheel is built up on what may be considered a secondary hub, which is slipped bodily upon the true hub that carries the bearing upon which the wheel runs. In one form, as used for light cars, each side of the secondary hub is furnished with three small projections, standing out slightly taper about 3-16 in. from the flange face. The bearing tube, which forms the hub proper, carries a disc at one end, with depressions corresponding to the projections. On the opposite side is fixed another disc having similar depressions. When the disc is screwed firmly home and secured by the lock nuts, the secondary hub is held firmly in driving contact by means of the projections and sockets. By removing the lock-nuts and the outer flange of the hub proper, the secondary hub, with its attached wheel, can be instantly removed. For larger cars a slightly different arrangement is adopted, the hub proper being provided with three pins, which pass right through the secondary hub and take the drive.

MESSRS. L. RUSSELL AND CO., of Station Road, Bexhill-on-Sea, are making a special feature of adapting petrol cars to the thermo-syphon system of water circulation, thus obviating the employment of a pump. By careful tests and close examination as to the position and size of water inlets and outlets of nearly all the engines that have come under their notice they have found it possible to introduce a natural system of circulation, fitting, in most cases, a combined radiator and tank, together with a fan of their own construction. In some cars they have, of course, to alter the outlets and inlets, these being often not large enough and frequently not in the right place. Some idea of the success of the system is shown by an old 12-h.p. Daimler, with a Phoenix engine; some seven years old, which now runs successfully without a pump. They have also converted several other vehicles, including one with an old type Panhard engine, and another with a Mutel motor. The cost of converting cars to this system naturally varies; in the case of a modern vehicle which has got a fairly large combined tank and radiator, the alterations required are not very great, but in the older cars, where a new radiator has to be made and supplied, as well as a fan, the cost is naturally greater; this, it is claimed, being more than counterbalanced by the freedom from circulation troubles and the increased accessibility of the engine owing to the reduction in the piping. We may add that, in addition to this special branch, Messrs. Russell's works are equipped with tools to enable all classes of motor-car repairs to be carried out, and that a large assortment of spare parts, tyres, greases, petrol, oils, carbide, &c., is kept on hand.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

DOES AN ENGINE RUN BETTER WHEN WARM?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As you are aware, there has been much discussion as to whether an engine should run better cold or hot. With a correctly designed motor there is not the least question that it should give more horse-power while running at a fairly high rather than at a low temperature. With a badly designed engine, however, the horse-power sometimes falls off, or fails utterly when the engine becomes hot, because the faulty design causes distortion or pre-ignition owing to individual parts becoming overheated. Some rather interesting tests have been carried out on the six-cylinder Napier engine, with temperatures of the water jacket varying from 56 deg. F. up to 212 deg. F. These tests show clearly that as the temperature of the water in the jacket increases, so the brake horse-power increases and the petrol consumption decreases—at any rate up to a certain point. Briefly, therefore, other things being equal, the hotter the engine is kept the more horse-power it will develop, the less petrol it will use, and the less it will cost to run. About 150 deg. F. appears to give the best results.

The tests in question were carried out on a 30-h.p. engine, and throughout the speed was kept constant or as nearly constant as possible,

THE TWO THOUSAND MILES TRIAL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the Royal Automobile 2,000 miles trial which it is proposed to hold this season, it seems to us that there is a point of very great importance which has hitherto escaped attention. We have brought this to the notice of the R.A.C. and believe it is to be considered by the Committee.

Taking the four leading causes of loss of marks in these trials, it seems evident that there are two which would be of very minor importance and two of very great importance. Taking as an example, two equally good cars, equally well driven, differing little in power and weight, in matters of reliability and hill climbing, accident barred out, these two cars can be counted on to approximate very closely to one another, and neither will be likely to gain much over the other. This leaves as the deciding factors petrol consumption and the speed attained in the race at Brooklands. Here again, if the cars were geared in identically the same manner, there would be probably very little to choose between them, but there is nothing in the regulations to stop one of these cars being enormously over-geared on its top speed, and it is to this question of the gearing that we have drawn the

Business and Pleasure.

After visiting the Argyl Company's Works at Alexandria, a number of English motor-car agents were recently taken a trip on Argyl cars to Stirling Castle, N.B., where the photograph reproduced above was taken.

at 1,100 revs. per minute. The engine was in every way standard, but obviously there was no attempt made to obtain the maximum horse-power the motor was capable of developing, the question being rather to ascertain what horse-power could be obtained at 1,100 revs. under varying conditions of temperature in the water jacket. The results of the tests show that the greatest horse-power and the lowest petrol consumption coincided, while the temperature of the water jacket stood at 149 deg. F. The results further indicated that a fall in temperature to 56 deg. F. in the water jacket showed the remarkable loss of 6.6 per cent. in brake horse-power.

The next column shows the results obtained in petrol consumption. At a temperature of 149 deg. F. the consumption was lowest, and at a temperature of 56 deg. F. it shows an increase of 11.5 per cent., whereas at this temperature the horse-power indicated a loss of 6.6 per cent. in brake horse-power.

| Water Jacket Temperature. | B.H.P. | Petrol Consumption. |
|---------------------------|-------------|---------------------|
| 149° F. | Highest. | Lowest. |
| 212° F. | 1.0 % less. | 55% more. |
| 186° F. | 6.6% less. | 1.38% more. |
| 115.7° F. | 3.64% less. | 4.8% more. |
| 56° F. | 6.6% less. | 11.5% more. |

These demonstrations seem to afford an interesting field for discussion. I give the results obtained, and leave the matter there.—Yours truly

S. F. EDGE.

R.A.C.'s attention, because it seems to us that the whole result of the trial will depend upon this. Obviously, if one of these cars is geared to forty miles an hour at 1,000 revolutions of the engine and the other car is geared to sixty miles an hour at 1,000 revolutions of the engine, the higher-geared car must use less petrol and must win the race at Brooklands; and it is, of course, not at all impossible, by means of a special gear-box, to arrange that a car shall be thus tremendously over-geared on the top-speed, while the speeds on the lower gears shall remain exactly as they would be on an ordinary standard pattern. Thus, as practically none of the timed hill climbs can be taken on top speed, nothing will be lost on hill climbing, and the abnormally over-geared car will be a winner and gain an altogether illegitimate amount of praise and advertisement.

If anybody has any doubt as to the effect of this overgearing on the petrol consumption, they have only to turn to the records of last year's Scotch Reliability Trial. In this trial two cars were entered by the same manufacturer. One car was enormously over-geared, and the other, of very much smaller power, was geared in the ordinary standard manner. The result was that the high-powered over-geared car very handsomely beat its smaller ordinarily geared sister in petrol consumption.

This abnormal gearing of the car will have far more serious results in the R.A.C. Trial, owing to the introduction of the 200 miles race, to the method in which the cars will be marked, and to the attempt to finish these trials in a cloud of glory at Brooklands in such a manner that the actual winner will receive an altogether undue amount of praise and advertisement.

It certainly seems to us that a 200 miles race at Brooklands is worse than useless. It means speeds which can never safely be attained on the roads, speeds which the public neither want nor ask for. Surely what is wanted nowadays is a first-class carriage which will carry its passengers about in a sensible manner, having due regard to the nature of the roads, in the most comfortable, convenient and silent fashion, and, as far as humanly possible, absolutely reliable and immune from breakdown; and we utterly fail to see the point of submitting a carriage which has to fulfil these conditions to a 200 mile scorch at Brooklands. It seems to us that it would have been far wiser to have fixed some reasonable speed limit for this special 200 miles race—a limit which would have most thoroughly tested the car's endurance, and yet not have introduced the objectionable features of the arrangement.—Yours truly,

NEW ENGINE (MOTOR) COMPANY, LTD.
J. C. Mort (Director).

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the owner of a 16-20-h.p. car I have been very much interested in this discussion. I do not think that "Interested Enquirer" is justified in his condemnation of the sporting offer made by Larrad's Syndicate, as no better proof could be given of their confidence in their system. "I. E." writes that he has told them what happened to one engine which had valves overlapping—"the result was disastrous." I do not quite understand the case he refers to in your issue of February 8th. He says "the mechanic suggested opening the exhaust valve earlier, and closing it later." How can that be done by mere adjustment? If it opens earlier it must close earlier, unless you fit a wider cam. If the exhaust valve he refers to was made to open earlier it must have closed considerably before dead centre was reached, and that might

The 18-h.p. (1908 pattern) Minerva Car just supplied by A. W. Gamage, Ltd., to the Bishop of Bangor.

account for the result proving disastrous. The subject is most interesting, and your readers would welcome further discussion. Exhaust valves are made to open at distances varying from 30 to 60 degrees from bottom of firing stroke; which distance will give the best pulling results?—Yours truly,

YORKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re the letter in your issue of the 29th ult. I am not in the least offended by the £50 offer—I only regretted the principle—there seems too much of this sort of thing in the motor-car trade. Nor, on the other hand, am I mistaken as regards the instances I mentioned, however much the Larrad Syndicate may think so. I do not, either, cast the slightest doubt on the instances they quote. I quite believe the cars ran better, but there are points of interest in this valve setting that require more going into. In the first place there are certainly, and I am quite ready to admit it, several cars which are (1) not timed right and (2) in which the valves do not synchronise. Now the Larrad timer, as I understand it, irrespective of the special setting, sets all the valves alike, and that is a thing one rarely finds on any car. I had a car when living in France which to my idea was timed wrongly, and not only that, none of the four cylinders were alike. I queried the makers and they sent me a chart of the timing, and I found it was wrong according to their chart, so I altered it to their chart and found a very slight improvement. I had another go at it then. I marked the flywheel out with a protractor and set every valve dead accurate, and the difference was marvellous, which clearly proves that the synchronising of the valves was of far more importance than the actual altering of the timing. And this is why I fancy the Larrad Syndicate effect the improvement they talk of in other words. The improvement is due more to the synchronism than to the actual setting. Personally I take the

trouble to keep valves accurate on my own car, though most people certainly do not, and that is why I get very good results.

There is a drawback, if the Larrad Syndicate will permit me to say so, to their setting in a good many cars, and that is the very long exhaust period cannot be obtained without radical alteration to the cams, sometimes very costly. Take, for instance, an ordinary exhaust setting, opening about 35 deg. from the centre and closing dead centre and $\frac{1}{4}$ in. clearance between valve and support. To get the Larrad period will require a good deal of work, won't it? Do the Larrad Syndicate adopt the same exhaust setting for engines with automatic inlet valves? This is an interesting point, as they cannot claim that the incoming gas will sweep out the exhaust gases, as presumably the inlet will not open until the exhaust is closed. I thank the Larrad Syndicate for their invitation, and if in the neighbourhood I will with pleasure witness the trial; in all probability, however, unless it is soon, I shall be in France. I should like to mention *en passant* that, so far as internal combustion engines go, I have had practical engineering experience lasting over ten years.—Yours truly,

INTERESTED ENQUIRER.

HILL CLIMBING IN EDINBURGH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My letter about Frederick Street, Edinburgh, seems to have created a stir, which I regret. My purpose was to save my friend Mr. Richardson from misconception by those who know the place he wrote about. As to Mr. Richardson's suggestion for a contest between his car and mine, I must express my desire to be excused. 1st.—I never compete with anyone. 2nd.—My car is purposely geared for my own wants, and not for showing off on particular gears. 3rd.—Anyone who wishes to pass me at the speed I am on, I always allow to pass me, and do not alter my pace or my gear, not being naturally jealous. 4th.—I decidedly object to competitions of all kinds on the public highways, when speed is a part of the conditions for success. 5th.—I have no ambition to shine as a climber on the highest gear, and my car is not geared for any such purpose. I do not care what gear I climb by if I get up to my own satisfaction, and if others have satisfaction in performing top gear feats, they are welcome to do so, and to have any opinion of my car and myself that they please; I am sure it will be a good-natured opinion. Mr. Townsend kindly offers me an opportunity of driving his car up the gradient in question. I should not be happy in doing so, however well he may be insured. I never drive any car but the one for which I am myself responsible.—Yours truly,

J. H. A. MACDONALD.

DO PETROL CARS RUN BETTER AT NIGHT?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Every now and then during the past few years the question has cropped up in the correspondence columns of the motoring Press as to whether petrol cars run better at night than during the day. As a close follower of the various letters that have been published, I have yet to be convinced that they do. I was therefore somewhat surprised to read in the memorandum prepared by Mr. H. Myddleton Gavey for the Motor Union and presented to the Chancellor of the Exchequer as one of the arguments against fixing the basis of motor-car taxation in accordance with the horse-power of the engine, that "no one who has driven cars much will deny that they run far better at sundown to the extent of several h.p. than at other times of the day." The inclusion of such a statement in the memorandum gives it a sort of official cachet, and no doubt Mr. Gavey must have some authority for making it. In view of the great interest that has always been shown in the matter I am sure there are many motorists who would like to hear more from Mr. Gavey on the point.—Yours truly,

BASINGSTOKE.

THE INTERNATIONAL TOURING CAR TRIAL REGULATIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In November last the Society of Motor Manufacturers and Traders issued a circular, with which was an accompanying chart giving details of a "suggested" standard for touring cars. This circular was issued only the day before the Olympia Show opened, so that for the fourteen days' duration of the exhibition it was impossible for any person engaged in the industry to pay any attention to it. On December 21st we addressed to the Society of Motor Manufacturers and Traders, to the Royal Automobile Club, to every member of the Special Committee of the Society who had been engaged upon the above referred to production, and to every member of the Technical Committee of the R.A.C., a letter dealing with certain objections, from the small car point of view, to the projected touring car standards. On December 30th the secretary of the Society of Motor Manufacturers and Traders replied on behalf of that society to the said letter, when he stated: "The regulations for the proposed contest have proceeded so far that it is out of the question to even consider any radical alterations, even if the points involved are such as might have received special consideration if brought forward at an earlier date."

This means that in six weeks, two of which were occupied by the Olympia Exhibition, the suggestions of the society had become so in-

flexible that they could not be altered. Moreover, it is suggested that the contents of our said letter, which appeared in the press at the time, were of such a nature that, however early the letter had been received, no consideration would have been given. The chart, which was issued as above stated in November, divided cars according to R.A.C. horse-power rating into ten classes. Class 2 was for cars of R.A.C. horse-power from 6.4 to 12. When the regulations of the International Touring Car contest were issued last week it was found that the inflexible rules concerning which any suggestions for alterations could not be considered had in fact been altered so that Class 2 of the said competition is for cars of from 6.4 to 13 R.A.C. horse-power.

When the said chart was issued a good many remarks were made as to the reason why the increase of horse-power was not proportionate and constant in the progressive classes, and why the decimal point so frequently fluctuated. The R.A.C. and the S.M.M.T. no doubt can explain this, but it is admittedly beyond the reasoning of an average man. Upon the face of it, it may appear that to have altered Class 2 by increasing the maximum horse-power from 12 to 13 is insignificant. It is, however, very far from insignificant, inasmuch as it renders no less than at least sixteen cars, which would otherwise have had to compete in Class 3, eligible to compete in Class 2.

It has been stated that the small car particularly has been deliberately ignored or boycotted in organising the above-mentioned competition. Mr. C. Johnson has developed indignation at this suggestion, but if Mr. Johnson or anyone else can give any satisfactory reason:—

1. Why the inaccurate R.A.C. rating formula should be made standard;
 2. Why minimum weight for maximum horse-power should be made standard;
 3. By what unbiased and mathematically correct process the horse-power or "standard" classification was fixed;
 4. Why the above-mentioned alteration was made;
- then it is time for the supporters of the alleged rating formula and standards to speak up and clear the air.—Yours truly,

PERRY, THORNTON AND SCHREIBER, LTD.

STEAM CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Amateur's" letter I am pleased to give him my experience with steam. I have driven petrol cars of various makes since the passing of the Motor Act, and have always had a hankering after steam, but for a long time hesitated to get a steam car owing to the general antipathy to them which, as "Amateur" says, seems to exist. However, upon analysing this antipathy I found that it existed almost exclusively among people who either knew nothing about steam cars or else had only had experience of the rubbishy little American cars that came over to this country in the early days of motoring.

About three years ago I bought a Serpollet, and have been driving one of these cars ever since, and must say I am thoroughly pleased with it. I certainly would not now go back to a petrol car. One soon gets into the way of handling these cars, but it takes a little time to get the best results out of them. Of course, steam cars have their drawbacks, among which it may be mentioned that it takes from ten to fifteen minutes to start from all cold, also the heat of the car, which some people object to, but which, at times, is very agreeable. As against these the beautiful flexibility, the splendid hill-climbing powers, and the absence of complications, such as clutch, change-speed gear, and electric ignition, more than counterbalance the disadvantages in my opinion.

Steam cars are not subject to those mysterious complaints which sometimes attack petrol cars and which baffle even the most experienced to diagnose.—Yours truly,

STEAM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I can assure "Amateur," whose letter appears in last week's *M.C.J.*, that he need anticipate no difficulties in the running of a Turner-Miesse car. I have had mine for close on four years, and quite expect it to be good for another four years at least. Although I do not own a petrol car, I have had enough experience with them to convince me that a change would not be for the better. I do not know why the prejudice against steam should still exist; it would be interesting to know what "Amateur" has in his mind, but I can assure him that I should not have run my car all these years had I had the trouble that he fears. In short, I consider that if "Amateur" wants a thoroughly reliable, simple, and economical car he cannot do better than get a Turner-Miesse.—Yours truly,

ERNEST A. LEATHER.

EXCESSIVE PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have recently taken over a 5½-h.p. Baby Peugeot which is in excellent condition and pulls well. I am an old motorist, and have found no fault at all with the engine or gears. My one trouble is petrol consumption. I understand that these cars have different carburettors. The petrol consumption is twenty miles to one gallon, and there is no shooting of the plugs. The reason I think I ought to get more per gallon

is that the engine still runs powerfully, with the spark fully retarded and air inlet wide open. One part of the carburettor is actuated by a pedal, and I believe it is really intended to be an accelerator. But when the pedal is pressed down it shuts off the gas and the engine pulls up quickly. It is very nice for slowing up, but there is plenty of control on the car without it; if you think this has anything to do with excessive consumption. For myself I think something wants doing to lower the level of the petrol in the float chamber and the nipple closing. I have not examined this yet, as I thought it best to have your opinion first. I have done a lot of tackling with carburettors in the past and never really did much good, so I thought it best to have expert opinion before proceeding to do anything. I should be glad if you will advise me as to how to economise petrol. There is just one other thing I should like explained, that is, when letting in the clutch slowly for neutral or any speed there is a loud jar and the engine takes up the drive; then as the clutch is let in further if the gear is in, it slows down; when finally the clutch is completely in the car moves very sweetly forward or backward as the case may be. I may say that the pedal pulls out the clutch before putting on the brake or should do so, but for some unaccountable reason this also stops engine.—Yours truly,

F. S.

[These little cars should run twenty-five miles on a gallon at least. The cause of the excessive consumption of petrol is, no doubt due to the hole in the jet being too large, or else the level of the liquid in the float chamber is too high. We advise closing the hole in the jet. First get a taper jet-reamer, and mark how far it will enter the hole, so as to serve as a gauge for the better regulation of the reduced diameter. The hole can be closed up by planing, or by a little solder. The pedal referred to by our correspondent is not an accelerator but a throttle pedal, and therefore pressing it will of course shut the engine down.]

The 30-h.p. Six-Cylinder Napier Car recently supplied by the Kingston Motor Works, of Kingston-on-Thames, to Mr. Robert G. Taylor, of Surbiton.

The main features of this car are the Rudge-Whitworth detachable wheels, Hopper patent hood and special body by Mulliner, London.

We do not think this in any way affects the consumption of petrol in this case.

Regarding the trouble with the clutch, we should think that it is out of alignment with the flywheel, and possibly also the leather is too hard. As to the pedal brake, this should be adjusted so as to release the clutch first, with which it is interconnected on purpose, but it should have no connection whatever with the carburettor, nor should it stop the engine. It is only a question of proper adjustment.]

ARE TWO IGNITIONS NECESSARY?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see no need for two ignitions, provided one has magneto. I have one motor with high-tension magneto ignition, one with low-tension, and one with accumulators. I do not know which is the best, but the accumulators are decidedly the worst. I have had no serious trouble with the magneto; had both magneto and accumulator on a car, and found I did not want both, so took off the accumulator—this after three years' running. I had more trouble with accumulator in three months than with the others in three years.—Yours truly,

ERNEST ESTCOURT.

LIGHTING THE CAR.—Mr. J. A. Stephenson writes:—"I should be glad if those readers of the *M.C.J.* who have adopted electricity as a means of lighting the front and tail lamps on their cars would give particulars of the method they have adopted, what lamps do they recommend, and what source of current. If accumulators are used, what amount of light will, say, a 30 amp.-hour battery give?"

MOTORING IN THE SNOW IN DERBYSHIRE.

"Is the trip off?" said Mr. Percy Richardson, repeating a question put to him from our end of the telephone on Saturday morning; "not at all, if you're game for the run. We shall be able to show you what the car can do." A trio of us had accepted the invitation of the managing director of the Sheffield Simplex Motor Works to join him for a run over the Derbyshire hills in a powerful 45-h.p. six-cylinder car, but having regard to Thursday night's snowstorm, followed by the frost of Friday, and a further sheeting of flakes to hide the treacherous state of the roads, we had quite anticipated that Mr. Richardson would ask for a postponement of the trip. The idea that he might be desirous of emulating some of the feats of the Paris-New York racers, who are at present struggling with the snows of America, only occurred to us when the car stood at the "Independent" office entrance, and Mr. Richardson, thickly clad for the occasion, announced his readiness for departure, and promised us good sport. The car had not been specially prepared for the trip beyond having the ordinary tyres replaced by Kempshall rubber non-skidders. Mr. Richardson was himself to take the steering wheel, but he had with him a reliable lieutenant in Letzer, who for four years drove the King's car. Thus we made a party of five, and amid the curiosity of a small crowd which had gathered, attracted by the idea of a car going, apparently for a long run, on such a day, we swung out into Fargate, and were quickly away down Pinstone Street.

To the Millhouses car terminus it was a monotony of slush, with the damp air driving unpleasantly over our heads, and a splash of dirty snow occasionally coming over the wind screen. But our thought went forward to the high moorlands, where the snow must be lying deep and white. As we steadily ploughed our way up Totley Rise with the car, running on its second speed, going as smoothly and confidently as though the road were firm and clean, we had the panorama of the hills before us, and excitement began to generate as we realised we were in for both fun and adventure. At any season of the year the Derbyshire uplands have an attraction for the majority of us, but under a white mantle of snow they acquire a peculiar charm. Imagination, in fact, need not be placed at too great a tension to substitute an Alpine road for the mid-English country.

The air grew colder, sharper, more exhilarating as the road mounted towards Owl Bar, and on the moors we could see the snow being whirled aloft by the moderate north wind. "We shall be amongst it directly," said our man at the wheel. "You'll need your coat collars up." The country became more uniformly white, walls and hedges disappeared under huge drifted mounds, and only the gaunt branches of occasional trees stood in shivering black outline against the dazzling eye-straining expanse which rose up to the distant sky-line. Then we seemed to run into a mist, and faces tingled under a freezing blast. When it cleared we smiled at our coats, thickly sprinkled with fine snow, and at one another's dripping, shining faces. A glance at Mr. Richardson showed him gripping the wheel, passively unconcerned. The car had not been allowed to swerve an inch out of its course.

Not a soul was visible at Owl Bar. The Peacock Inn looked deserted, and the wind moaned as it raced past the house, and over the frozen wastes. Half a mile onward we plunged into a deep drift, which a couple of men were bravely trying to clear with the wind laying a fresh covering for every shovelful removed. "Is this where we get out and push?" we sang out cheerily as the car rushed into 18 inches to 2 feet of loose snow. There was no answer, but almost before we had spoken we were through the obstacle, and that, too, without a tremor or a bump. "Any more like this below?" called Mr. Richardson to the men on the road. "You'll just about get through," came the laconic answer.

Down the hill into Baslow the car rushed as easily, as swiftly, and as gracefully as a sleigh on an ice-run. Now and again we shot through another drift, and the snow spurted high above our heads as we drove through the powdery mass. The wind sang in our ears, and thin clouds of driven flakes hit at our faces until feeling was quietened into numbness. But it was all wildly exhilarating, and a laugh of exultation broke out afresh at every difficulty conquered. Gradually we began to gain the shelter of the rocks, and the frozen spray of the moors no longer reached us. The view of the valley as we sped towards the village was quietly beautiful. Two colours, black and white, predominated, and it was only when a clump of dead leaves clinging tenaciously to some stunted bush showed a momentary flash of dull brown that one noted a contrasting touch. The road softened as we got lower, and, despite more favourable conditions, we all instinctively longed to be high up again.

"Which way?" shouted Mr. Richardson. "Bakewell or Chatsworth?" "The park will be pretty," said one of our trio, and Chatsworth was the order. Round to the left went the car, and in a minute we were through the gates and in view of the noble palace of Derbyshire's duke. Here at last was colour. The bright sun shone full upon the house, and the rich stone glowed warmly against the cold stretches of the wintry countryside. I have seen Chatsworth in summer, when the grass has been green, but the skies lowering, and the place has appeared inhospitably imposing. This Leap Year day of February the mansion stood out magnificently inviting and splendidly picturesque. But we were whirled along, and a bank of virgin snow cut off the view. We had a chance to note that the park in its robe of white was bewitchingly lovely, that the sunshine set the untrodden, undulating expanse of

snow sparkling and quivering under the force of light, and that the river flowed sullenly and darkly between the gleaming white banks which confined it to its course.

No element, perhaps, is more impressionable to the weather than water; or, to put it more accurately, no element changes so greatly in its appeal to the mind as water. A little brook, which in the spring suggests joyousness, freedom, and mirth to the sympathetic observer, in the earlier months of the year seems a chilled, morose, imprisoned thing. The song of the running water alters from a major to a minor key, and strikes a note of discontent.

Through Rowsley and Darley Dale to Matlock interest slackened, and Mr. Richardson made good running through the sodden snow. The Bath had that atmosphere of dreariness which seems characteristic of a watering place on a winter's day, and we were glad of the comfort of the Royal Hotel.

Over lunch we planned the return route. As the car had behaved so well, the suggestion was made that we might take the risk of crossing to Wardlow Mires from Monsal Dale Head, as bleak and cold a passage perhaps as can be found in Derbyshire. Mr. Richardson was nothing daunted, and at three o'clock in the afternoon we were retracing our tracks past High Torr, and making for Haddon and Bakewell. The landscape of the Vernon country made a delightful winter picture, and there was infinite enjoyment to be found in the swiftly-changing panorama as we travelled rapidly through the vales.

The Wardlow Mires road gave us the finest ten minutes of the afternoon. The snow drifts were amazing, not merely in the matter of depth and extent, but in the fantastic shapes they had assumed under the rude architecture of the wind. Ridges had been thrown up during the storm,

Mr. P. Richardson at the wheel of the 6-h.p. Daimler Car he drove in the 1,000-mile Trial in 1900.

to be caved and hollowed and twisted by the freakish blasts, and while at one point on the road the surface would be almost clear, a few yards further on the snow would be piled in six and eight feet hillocks, which were continually being added to through acting as buffers to the scudding snow dust sweeping over from the north. Through the drifts a narrow track had been cut for vehicles, but it needed a steady and practised hand to keep us to the course, particularly when every gust of wind set the snow thrashing across the car. Once or twice we plunged into the banks, and really we expected to lose the footboards at every yard. It was a tribute to the strength and first-class workmanship of the Sheffield-Simplex cars that we came through without the slightest accident.

Strangely enough, it was on the ridge that we passed the only other car which seemed to be out on the hills on Saturday afternoon. The subsequent run through Middleton Dale to Calver, Grindleford, and Bamford was enjoyable, although we had left the fun behind on the hills. It had been our intention to return over Moscar top. A suggestion, however, that tea at Dore might be acceptable plunged every one in hearty accord; and after a call at the Marquis of Granby, we finished a splendid day by a sharp climb up to Fox House, crossing from there to Owl Bar, with the snow mists beating more fiercely than before, and a final glide down the freezing road to Totley. In the evening the sheeted fields were softer and more beautiful for the golden light of sundown, and the tints on the hills ranged from purple blue to a lovely rich cream.

Our vote of thanks to Mr. Richardson over tea was carried in ro formal spirit. The run had been a fine test of his pluck and skill. When we ventured to suggest as much, his answer was: "It's been a test for Sheffield steel, and I'd back that chassis to come through worse than we've tackled to-day."—L. A. N. in the "Sheffield Daily Independent."

A NUMBER OF THINGS: AND THEIR EFFECT ON TYRES.*

To make a back tyre live as long as a front one is one of a motorist's dreams, and when he has stated this wish categorically he has given himself an indication of a direction which research may usefully take. Let us take it, and so be led to consider certain effects which are known but rarely.

Many parts of a car seem to have nothing to do with tyres until one dwells upon their elementary functions. For example, nothing seems more inert in this connection than a distance rod. Considered as the piece through which the car is pushed forwards, it is known to be in compression and accordingly stiff. As being the piece which is connected both to the frame and to the axle it must be hinged at the fixing, and

Figs. 1 and 2.

as the sides of a car often rise and fall unequally on the springs, the distance rod must also be pivoted for side movement at the hinge. A radius rod is handicapped in life by taking part in an impossible task, and accordingly it fails. What this has to do with tyres will be shown first as regards chain-driven and then, more briefly, for shaft-driven cars.

With a chain-driven car the distance rod is often supposed to prevent the taut side of the chain from varying in tightness when the car body moves up and down on its springs. If it fails in this the drive to the road wheels will be irregular, and the tyres will rub. Looking into detail shows us that it does fail, and the question to be answered is simply this: Is the tyre rubbing due to this cause negligible? To study this we will first suppose the car at rest, the back road wheels prevented from turning, and a very heavy weight put on to the chassis over one of the back springs. This lowers the chassis, and with it the front sprocket (Fig. 1) from position S1 to position S11, which we may suppose to be the extreme movement when the car "bumps," say, 8 in. to 10 in.

The distance rod prevents S1 from leaving a circular path round the back sprocket. The upper chain is carried round with it, and is obviously wound on to the stationary back sprocket. At the same time a certain amount of chain is, for a similar reason, wound off the moving one. If the sprockets were of equal size, the amount wound off one sprocket would equal the amount wound on to the other, and neither would turn on its axis, as shown in Fig. 2. But normally the front sprocket is the smaller, and accordingly it has to rotate as shown in Fig. 1. It is very important to appreciate the amount of this rotation, and its direction. If a small sprocket moves once round another having a larger circumference, a length of chain equal to that larger circumference will be wound on to the larger sprocket. If, then, the smaller

Figs. 3 and 4.

Wheel diameter, 34 in.; radius rod, 22 in.; large sprocket, 12 in.; front sprocket, 8 in.

sprocket is one-third smaller, as is common, it will have to rotate through one-half of a revolution, and proportionally for fractions of a revolution. The direction of its rotation will, as shown by the sloping arrow in Fig. 1, be clock-wise for a downward movement to the dotted position. It will be noted that this tends to turn the engine backwards, after taking up all the backlash or play in all the gears engaged, including the chain.

* Abstract of paper read by Mr. Mervyn O'Gorman before the members of the Royal A.C., on Thursday, February 27th, 1908.

In practice, when the car is not stationary, the converse is usually the case—namely, the front sprocket S is prevented from backward rotation by the engine or the foot-brake—and the back wheel must, unless the chain snaps, rotate forwards (the backlash having already been taken up by the engine pull). Every time the tyre rides over a lump this occurs in some degree, and when, as sometimes happens, the car body oscillates vertically over the full range of clearance of the springs, the movement is greatly exaggerated.

It is easy enough to calculate the amount of movement, but it is more convincing to illustrate this forward rotation by a model made to half scale of a chain drive and road wheel. The front sprocket of the model is locked, and the road wheel free to turn. Taking a vertical downward movement of the springs of 8 in., and the usual dimensions of wheel and sprockets given in Fig. 3 the wheel turns through such an angle that the tyre slips forward 2 in. Simultaneously, the radius rod, in moving from a sloping to a more horizontal position, pushes the axis of the wheel through an additional distance of 2 in., as shown in

Fig. 5.

Fig 4. It is now necessary to see how long an interval of time this movement takes. If the time is very short, the inertia of the car and engine respectively will prevent their moving forward, and the wheel will consequently have to skid.

On an undulating road, at moderate speeds, it is possible to count on some cars as many as eight half oscillations in one second, but when a series of deep puddles is encountered, anyone carefully watching the axle of his car-bobbing up and down before him (the front axle is the easier one to watch for this purpose) will realise that one-fifth of a second is not an excessive time for a complete oscillation, or one-tenth of a second for a half oscillation. In the case of a raised "road-crossing," the complete half oscillation—i.e., the time between passing the crossing and feeling the bump—is certainly not much in excess of one-tenth of a second at high speeds of travelling. A simple calculation shows that a bad road hollow 2 feet wide traversed at forty miles per hour is passed in less than one-twenty-ninth of a second. Whether or not the wheel follows the profile of the ground on the first part of the down slope, it will be found in most cases that by the time it has struck the far side of the puddle and rebounds from it the car body will have started its downward movement. We have, therefore, the wheel moving up and the car body moving down with considerable velocity. As far as I could judge when noting this, the car had not moved three feet beyond the hollow before the bump occurred. At this speed three feet represents one-twentieth of a second, and during this short time the car would either have to be thrust forward 4 in., or the road wheels must skid round that amount.

To determine which must occur is quite easy, thus: To thrust a 3,000-lb. car forward 4 in. in one-twentieth second is to give it an added velocity of 80 in. per second or 6.28 ft. per second, or 4.4 miles per hour, and this would be done in one-twentieth of a second. Such a push, if continued for a whole second, would give the car a velocity of 88 miles

Fig. 6.

per hour (in one second), and would require a pull of 12,000 lb. This pull is seven or eight times the adhesion between the ground and the back wheels, so that we may safely say that the wheel skids, both at this speed and at speeds of one-half and one-third of this amount. The amount of the skid is 11 per cent., which represents work done in wearing and heating the road—raising dust and heating the tyre. The power to effect this work is derived from the engine, and is a loss. If we suppose that on the average this loss amounts to only 5 per cent., because the average travel of the springs may be taken at 4 in., we still find quite an important diminution of speed when the car is going all out. A remedy has occurred to me for this trouble in chain cars. I have two different sprockets from those we have been considering, both for the back and front. Contrary to normal practice, the small one is on the road wheel, and the large one in front. I will

recall that we had 2 in. of skid due to the sprockets and 2 in. more due to the radius rod, and all I propose to do is to work these two skids in opposite directions, and as nearly as possible simultaneously. This I show in Fig. 5, where at the end of the downward movement of the sprocket the two movements have, within a certain margin of error, cancelled out. In this particular case the sprockets are of the same diameters as were used before, their positions only have been exchanged.

It is clear that as the front sprocket turns slower for the same car speed, the gear-box ratios must be proportionally increased, and the front sprockets and their shafts, &c., made stronger. These inconveniences are matters of cost rather than technical difficulties, and I think them small compared to tyre bills. Moreover, 11 per cent. of skid, as has been shown, means 11 per cent. loss of power—a larger loss than that due to the increased gear reduction ratio. It is notorious that a car side-slips less when the clutch is out. This immunity arises chiefly, as is well known, because the engine is no longer pulling at the wheels, but also in a less important, but not negligible, degree, because the jerky efforts on the tyres due to the springs are now free to expend their malign influence on the light part of the clutch, which, having little inertia, can vary its speed very freely, and so relieve the wheels.

Before leaving the question of skidding and chain-driven cars, I would like to put forward for discussion a suggestion for placing the gear-box in a new position. This new gear-box position, which offers some merits, is at the rear, instead of in front of the road wheels, as shown in Fig. 6. Side sprockets in front of the doorways of the normal car are drawbacks which have sent many a buyer in quest of live-axle cars, especially for town carriages. The gear-box becomes more accessible at the back, yet it would not be any more prominently ugly than the tank which so often figures there. The tank, it is true, would be displaced to the popular position under the front or back seat, where it would obstruct nothing. A slight shortening of the wheel-base for a given amount of doorway space would result from moving the front axle, say, 6 in. back.

The reasons against it are not negligible, for I think there are many who will not abandon the "gate" change under any consideration, and this would seem necessary. Designers will object to the long rods required to actuate the distant spur wheels, and to the long propeller shaft necessary to reach the gear-box, though similar difficulties have been overcome in commercial cars and omnibuses.

As regards cars with propeller shafts, I will treat this section briefly, and begin by showing a model of a car like some that are now being made, in which there is only one universal joint behind the gear-box instead of two. This car has the curious property that, if fitted with a fine ratchet sprag, it can be caused to travel forward by the persons in the tonneau simply jumping up and down so as to work the springs, and illustrates the effect that a road shock has in causing the road wheels to turn forward, or, failing this, to skid.

From the point of view of the heavy unsprung weight on the back axle, the propeller shaft car should be substantially harder on tyres than the chain-driven vehicle, and in some cases it is so. In other methods of construction such care has been taken of what I have called the "radius-rod effect," that in spite of the above indicated disabilities they are actually less wearing to tyres. In the propeller-type car the following provisions must be made:—(a) A universal joint to allow the transmission to be flexible. (b) A push rod (corresponding to the radius rod of chain cars) to push the car along. (c) A torque rod, sometimes the springs, sometimes the propeller shaft itself, arranged to take the reaction of the drive; that is to say, a piece which tends to lift the front of the car when the engine exerts its power. Each of these provisions has problems incidental to it, which bear on the wear of tyres.

No self-respecting maker allows the propulsion or push forward of the car from the road wheels to take place through the propeller shaft, as this would throw an immense pressure on the universal joint, and on the bevels, consequently some form of push rod is provided. This rod is being used in compression, and should be of fixed length like the radius rod of chain cars. Unlike it, however, it may without inconvenience be made very long, so that the angular movement for a given play of springs is less. Still, however, both causes of wear mentioned in connection with chain-driven chassis are found here in some degree:—(1) The axle is forced backwards, because the horizontal projection of the push rod is increased. (2) The wheel is caused to rotate through an angle swept out by the push rod, and these two troubles are additive.

Lastly, in those numerous cases when the push is taken through the springs the flattening of the spring gives a further movement backwards to the axle, and this movement is again additive.

In the worst cases of propeller-shaft cars the effect of spring action is worse than with chain cars, but in the majority of propeller-shaft cars such precautions have been taken in one way and another, that they are better than chain cars as made at present in respect of "radius-rod effect." I am disposed to think that the superior kindness of chain cars to their tyres would long ago have become accepted, were it not for the much greater length of the push rod and propeller shaft in the live-axle type.

The torque rod does not affect the question of tyre wear, save in so far as it is through its agency that the engine causes the back wheels to take an increased share of the load or weight of the car, and to relieve the front wheels to a corresponding degree. Some torque rods act against a spring, and in this kindness is shown to the tyres at starting.

In the best type of live-axle cars employing two universal joints, a slide, and a parallelogram of radius rods, the effect we have been con-

sidering is reduced in practice to less than one inch of tyre movement for 6 in. of spring movement. All that is now wanted is that a demand should arise for cars which are *easy on tyres*, as against cars which are simply cheap in capital cost. A hundred pounds invested in this way in the car will very easily earn its interest.

In conclusion, I must admit that I have obviously only dealt with very few of the "numbers of things" which cause back tyres to wear more than front ones, so I will give a summary containing some remaining causes. Wear of tyres is ascribable to:—

(1) *Engine driving effort*: (a) Even if the turning moment is uniform. (b) Un-uniform turning moment exaggerates this wear somewhat, but the un-uniformity of the ordinary engine of four or more cylinders is smothered under the other un-uniformities introduced elsewhere.

(2) *Clutch*: (a) If fierce or let in roughly. (b) If fierce, especially when reversing, as the torque takes load off the driving wheels.

(3) *Radius-rod Effect*: (a) With chains I believe this to be practically curable by adopting my relationship between sprockets and radius rod. (b) With propeller curable by two universals, one slide, and a proper parallelogram of distance rods.

(4) *Transmission*: Part of the transmission often introduces an un-uniform conversion of speed—e.g., one universal joint (so does a chain, both in a small degree usually).

(5) *Weight* causes bending of side walls, and therefore fatigue of tyre. The drive of the engine transfers weight, say 100 lb., to the back wheels, and adds to this effect. Unsprung weight on back axle causes heavy blows on the ground, the momentum of which adds further to this effect.

(6) *Brakes* cause skid and wear. The effect of applying the brake is unfortunately to take weight off back wheels. Unbalanced brakes: Loss of adhesion by applying brakes to only two wheels, thus doubling the wear on them.

(7) *The Differential*, owing to its unfortunate property of turning the wheel with least adhesion.

Some of these causes of wear are important from the magnitude of the motion, and some are important from their frequent recurrence. An example of the one is the effect of a fierce clutch on reversing, and an example of the latter is the effect of an un-uniform turning engine, say, of two cylinders, or with an inadequate flywheel. But of all the above-named causes one stands out as combining frequent occurrence with fairly large movement, and I lay this charge to that part of the transmission in chain-driven cars, with which the radius rod is associated. There is reason for thinking that if this trouble of chain cars were cured, the great comparative lightness of their back axle—i.e., the absence of excessive unsprung weight if combined with a very gentle acting clutch—would render them so much cheaper to keep in tyres as to turn the tide of popular feeling strongly in their favour once more, even for cars of as small a power as the now prevalent 24-h.p. (R.A.C. rating).

AN INLAND REVENUE CASE.

THE Hon. Mrs. Henry Beresford, professionally known as Miss Kitty Gordon, has attended before Mr. Plowden, at Marylebone, to answer summonses by the Inland Revenue Commissioners for employing a male servant (chauffeur), keeping a motor-car, and wearing and using armorial bearings on the car without having taken out the necessary revenue licences for the previous year. Mr. Barry Cohen, solicitor, who defended, in explaining why Mrs. Beresford had not taken out the licences, said she had shared with the general public a mistaken idea that in paying the London County Council licences for the car and the chauffeur she had done all that was required of her. She had also been under the false impression that a chauffeur was not regarded as a male servant; and with regard to the armorial bearings, she fell into the common error that, having inherited a right to use them, she was not required to pay for them. Mr. Plowden ordered her to pay the amount of the licences—£7 1s. in all.

OWING to their increasing business, the Motor Supply Co., Ltd., have found it necessary to acquire the premises at 110, Piccadilly, London, W., adjacent to their present showroom and offices.

WE understand that the old-established firm of Geipel and Lange have changed their name to Geipel and Co., Mr. Lange having retired from the business some eighteen months ago.

THE 45-h.p. Mercedes which His Majesty King Edward has recently ordered from Messrs. Daimler Mercedes, Ltd., is to be fitted with a covered body. It will have two ignitions, Bosch low-tension magneto and high-tension coil and accumulator, and its driving chains will be protected by the new Mercedes chain cases.

APART from possessing an accessory which, to use a time-honoured phrase, meets a long-felt want, the success of the Stepney Spare Wheel Company is in no small measure due to the enterprise which has been shown in connection with the business. An excellent proof of this was afforded us one day last week by the arrival of a bundle of six catalogues, which, on examination, turned out to be each in a different language—English, German, French, Italian, Spanish, and Portuguese. As these catalogues are being widely distributed in the countries in which the respective languages are spoken, the reputation of the Stepney spare wheel bids fair to become world-wide at no distant date.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE arrangements for the entertainment to follow the annual dinner of the Club on the 12th inst. are in the capable hands of Mr. Frederic Coleman.

A French set of Customs papers recently issued by the Royal A.C. Touring Department to Lord Cairns bore the number 2,000, thus proving the popularity of that department.

AUTOMOBILE ASSOCIATION.

THE efficiency of the road organisation scheme of the A.A. was recently shown in the recovery of the lamp of a member that had been lost from his car while travelling on the Bath road.

Mr. Walter Gibbons is kindly undertaking the direction of the musical entertainment to follow the third annual dinner at the Hotel Cecil on the 18th inst.

AUTO-CYCLE UNION.

LECTURING to the members of the Auto-Cycle Union last week, Mr. H. G. Ball gave a forecast of the future of the movement, and touched on some very practical points. The two-speed gear in use on a machine effected a great reduction of the side-slip evil. Its existence on a machine permitted a slow speed to be maintained without any sharp "snappy" pulls on the back wheel, since the engine could be run at a fair speed though the machine's rate of progress was comparatively slow. Where the two-speed machine scored most of all, perhaps, was in hill-climbing when the roads were treacherous. The fast rush necessary on the single-gear machine, when one wished to ensure reaching the top, was attended by considerable risks. He was optimistic as to doctors, in particular, taking advantage of the assistance to them the light-weight machine afforded. They were almost invariably mechanically inclined, and quickly took up anything that assisted them. The chief merit of the light-weight machine was its hill-climbing quality, while their engines made little noise. The most remarkable point in connection with the light-weight machine was that instead of a demand having created a supply the usual position had been reversed.

THE ROADS IMPROVEMENT ASSOCIATION (INCORPORATED).

IN continuance of its investigations into the problem of dustless road construction the Roads Improvement Association has just issued a pamphlet giving particulars of the "Gladwell" system of construction and renewal of road surfaces. It contains a specification jointly drawn up by Mr. Arthur Gladwell, Engineer and Surveyor to the Eton Rural District Council, and Mr. G. W. Manning, Engineer and Surveyor to the Staines Rural District Council, with an introduction by Col. R. E. Crompton, C.B., M.I.A.E., M.Inst.C.E., Vice-Chairman of the R.I.A. Messrs. Gladwell and Manning show that, in their respective districts in Buckinghamshire and Middlesex, by following the system that they have specified they successfully laid lengths of road at a cost of, at the outside, 3l. per square yard in excess of the ordinary cost of repairing by the older methods, and when the increased durability and reduced cost of scavenging of the waterproofed surface is taken into consideration, the cost of maintenance, spread over a term of years, seems in a fair way of being reduced, in spite of the heavier traffic which is practically certain to come on all classes of roads in the immediate future.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

THE first general meeting of the Graduate Section of the above institution was held at 1, Albemarle Street, W., on Tuesday of last week, over forty graduates and friends being present. Dr. H. S. Hele-Shaw took the chair. A paper was read by Mr. L. H. Baskerville-Cosway on "The Methods of Testing a Motor-car." The influence of design upon testing and the tests, the tests of materials and castings used in making a motor-car were the first two points dealt with. The "running in" of the gear-box and the back axle, the erection of the engine with the setting of the valves and ignition followed. Passing to the testing of the engine and defining the preliminary adjustments of the carburettor and ignition systems, the reader gave an idea of how the brake-horse-power could be determined by the dynamometer. The testing of the chassis on the road with further adjustments to carburettor, ignition and transmission systems were then considered, and the testing of the completed car and such points as the location of squeaks, efficiency of brakes, clutches and steering gear, &c., concluded the paper.

Discussion followed, in which Messrs. Taylor, Hubbard, Hopcraft, Hooper, Thomas, House, Power, Thompson, Bishop, Kennelly, Harvey, Birchall, Hounsfield, Harrison, and Bourne took part. The Chairman remarked that the paper and discussion had brought forth a number of points which would prove very interesting if they were read before the Section in the form of papers. He called for a vote of thanks to the writer for presenting such an interesting paper, and this was heartily responded to. Mr. Cosway briefly replied, and the proceedings terminated with a vote of thanks to Dr. Hele-Shaw for taking the chair.

CRYSTAL PALACE A.C.

FROM the number of entries already received the forthcoming Open Flexibility Competition on April 11th gives promise of being a success. Several 8 x-cylinder cars which have not yet taken part in any events in England will be running, amongst others being the Porthos, of which two sizes are entered, one by Messrs. Colin Dafries, the other by Mr. Malcolm Seton-Karr.

LADIES'.

RECENTLY, Mr. Sedgwick Currie, M.I.A.E., addressed a number of the members of the L.A.C. on the subject of "Carburettors and Carburation." He dealt with this matter very fully and gave the members many important hints as to the care that should be taken of carburettors. Gears and gearing were also dealt with, and practical sketches and parts were shown or described of every known system of gearing. The following lesson was on "Differential, Cardan Shafts and Live Axles," which were concisely described, the descriptions being made interesting by the many parts which had been lent for the purpose of demonstration by Messrs. Daimler, London Motor Garage (Charron), and Adams.

Mr. and Mrs. Charles Cordingley have this year again invited the members of the L.A.C. to visit Mr. Cordingley's thirteenth International Automobile Exhibition at the Royal Agricultural Hall, Islington, and afterwards to take tea with Mrs. Cordingley in the club room. The invitations are for Thursday, the 26th inst. It is hoped that members of the club will be able to visit the Exhibition on that day.

The Electrical Motor Ambulance recently supplied to the Fire Brigade of Bremen by the Norddeutsche Automobil und Motoren Gesellschaft.

MOTOR YACHT CLUB.

THE annual general meeting of the Motor Yacht Club and of the Motor Yacht Club Proprietary, Ltd., was held at the Royal A.C. on the 27th ult. The Rear-Commodore, Commander Mansfield Cumming, R.N., took the chair, and there was a good attendance of members. Mr. F. P. Armstrong presented the annual report, which was carried unanimously.

The Duke of Sutherland, K.G., the Lord Montagu of Beaulieu, and Commander Mansfield Cumming, R.N., were re-elected the flag officers of the club, and Mr. Lionel de Rothschild was re-elected hon. treasurer. The meeting then proceeded to the election of the new committee, the result of the ballot showing that the following were elected:—Messrs. F. P. Armstrong, F. R. S. Bircham, F. H. Butler, E. J. Caldwell, Lorne C. Currie, Capt. R. T. Dixon, R.E., Commander Sir Hamilton Fraser Smith, R.N., Messrs. J. G. Knowles, H. W. Hutchinson, A. G. New, G. Foster Pedley, Bernard Redwood, J. A. Reanie, G. F. Sharp, J. D. Siddeley, L. R. L. Squire, T. Thornycroft, T. D. Wyna Weston, the Hon. A. Verney Cave, and Major S. F. Warren. Messrs. A. W. Barr and Co. were re-elected auditors.

IRISH.

SIR HORACE PLUNKETT, K.C.V.O., took the chair at the annual general meeting of the Irish A.C., which took place on Thursday week at the clubhouse, 34, Dawson Street, Dublin. The adoption of the annual report was moved by Sir Wm. G. D. Goff. The report reviewed at length the work done by the club during the past year, the examinations for driving and proficiency certificates, the holding of the Irish Reliability Trial and the recent show at Ball's Bridge, and the general work of the club for the benefit of the movement in Ireland. The report was adopted, and also the statement of accounts. Some slight alterations were made in the rules relating to the subscriptions of lady members, and the negotiations regarding an extension of the lease of the club premises were approved. The election of officers for the

coming season resulted as follows:—Patron, His Excellency the Lord Lieutenant of Ireland; president, Right Hon. Sir Horace Plunkett, K.C.V.O., P.C.; vice-presidents, the Marquis of Waterford, the Earl of Drogheda, Viscount Iveagh, K.P.; chairman, Sir William G. D. Goff, Bart.; vice-chairmen, T. Talbot Power; hon. secretary, E. White; hon. treasurer, Walter Sexton. The ballot for the general committee resulted as follows:—Major E. H. C. Wellesley (Co. Wicklow); J. B. Denlop, jr. (Co. Dublin); R. J. Meccredy (Co. Wicklow); T. L. Plunkett, D.L. (Co. Dublin); F. W. Perry (Co. Dublin); Pryce Pescok, M.D. (Co. Dublin); Hum Bland (Co. Wicklow); J. C. Percy (Co. Dublin); H. S. Close (Co. Armagh); J. M. Davies (Co. Dublin); W. S. Hayes (Co. Dublin); G. O'Grady (Co. Dublin); F. M. Mooney (Co. Dublin); C. W. Hely, J.P. (Co. Dublin); T. Henshaw (Co. Dublin); F. Hall (Co. Dublin); J. E. St. George (Co. Dublin); Col. Chaloner Knox (Co. Kilkenny); Major P. T. M'Cammon (Belfast); W. P. Cairnes (Co. Louth).

A vote of thanks was proposed by Sir Wm. Goff to the Press, and the proceedings terminated with a customary vote of thanks to the chairman.

ON Wednesday of last week the Motor Club held a cheery house dinner, after which some seventy members adjourned to the Alhambra, where Messrs. Scott and Woodford show motor pictures on the bioscope. A motor gallop, specially composed and dedicated to the club by Mr. G. W. Byng, was played during the evening.

A MEETING of the Purley and District M.C. Club will be held on the 7th inst., at 8 p.m., at Messrs. Couldrey's Rooms, Tram Terminus, Purley.

THE Lewisham A.C. will hold its annual hill climb at Sevenoaks on the 4th prox. Mr. H. B. Renner, 31, Kidbrook Park Road, Blackheath, S.E., is the hon. secretary.

The popular model of the German 14-h.p. Car which has just been put on the market by Captain Theo Masul.

The vehicle is supplied complete with all accessories, and is fitted with a comfortable side-entrance body upholstered in leather.

MR. G. W. LITTLE, hon. secretary of the Middlesbrough M.C.C., is organising an inter-club meet of motor-cyclists at Ripon for Easter.

MR. HAROLD FULLER, of "Wivenhoe," Wyndale Road, Woodford, has been appointed general hon. sec. of the Essex M.C., Mr. A. G. Reynolds, financial hon. sec., and Mr. E. J. Bass, trials hon. sec.

A SMOKING concert promoted by the Southend M.C. was held on Wednesday last week at the Hotel Victoria, Southend-on-Sea. Captain J. L. Vivian Millett, chairman of the club, presided, whilst Mr. J. B. Caruthers, A.C.A., hon. treasurer, occupied the vice-chair. Parties from the West Essex A.C. and North London A.C., Nore Yacht Club and Essex Yacht Club attended the concert.

THE opening run of the Tottenham Cycling and Motor Club will take place on the 12th inst. Mr. R. Gregson has just been elected motor captain. The secretary's address is at Belvedere House, Willoughby Lane, Tottenham.

AT the annual general meeting of the Incorporated Institution of Automobile Engineers, to be held on Wednesday next, a membership of 258, including members, associate members, graduates and all associates will be reported.

MESSRS. BRAMPTON BROS., LTD., have removed their London offices to 138, Long Acre, London, W.C.

THE UNITED MOTOR INDUSTRIES, LTD., have just issued a circular on the value and use of an amperemeter, which they will be pleased to distribute to any of our readers who are interested.

A MATCH has taken place on the Brooklands Track between private owners of a 15-h.p. Ford and 14-18-h.p. Argyll. The former car was driven by Mr. O. L. Bickford, of Oxford, and over one lap the Ford won by 100 yds. at an average speed of 36 miles per hour.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.

Before Mr. Harry Scarlett and other magistrates, at Lewes Petty Sessions, Charles Gazzard, chauffeur, 4, Tankervell Road, Streatham, has been summoned for exceeding the legal speed limit near Lewes gaol on February 2nd. Mr. Lawson Lewis prosecuted and Mr. E. T. Wellsted defended. In his opening statement, Mr. Lewis said the car was a 50-h.p. He then called Jeffrey Livesey, who said he was driving an 8-h.p. Rover towards Brighton that day and was going slowly owing to the large number of pedestrians about. Without sounding any warning, a large red car came tearing along and seemed to be coming straight into him. In consequence he steered into the ditch and stopped. When about ten yards off the big car was suddenly turned to its proper side and passed him at about forty miles an hour—a terrific pace—and a hand could not have been put between it and his car. He turned round "expecting to see several pedestrians lying on the road." Sergeant Waghorn said he came into possession of the number of the car and traced it to 48, Dover Street, where he saw defendant and the owner. Gazzard admitted being along that road on the day in question. The Bench imposed a fine of £10 and 9s. costs and three guineas for the prosecution costs—a total of £13 12s.

A LEGAL POINT.

At the South Western Police Court, before Mr. de Grey, Mr. Albert George Brown, residing at Bangalore Street, Putney, answered to two summonses, at the instance of the police authorities, for driving a motor-car at an excessive rate of speed and to the danger of the public.—Mr. Barker prosecuted for the Police Commissioner, while Mr. Staplee Firth defended. After hearing evidence Mr. de Grey would not say for a moment that the defendant, when saying that he travelled at the rate of twenty miles an hour, had been guilty of deliberate perjury. He imposed a penalty of £15 with £3 3s. costs in respect of the first summons for excessive driving, adjourning the second to consider a legal point raised by Mr. Firth that his worship could not record another conviction under an Act of Parliament that governed both offences.

A BATCH OF DISMISSALS.

The precautions taken by the Kesteven County Police to prevent motorists from driving their cars at an excessive speed on the Great North Road continue to result in prosecutions, and three more cases were dealt with by the Spittlegate (Grantham) magistrates on Saturday. The defendants were the Hon. Maurice Gifford, of Boothby Hall, Grantham; Charles Hay, of Manor Park House, Worksop; and Mario Resta, of 6, Mill Street, Hanover Square, London. The alleged offence was of driving at an excessive speed on the Great North Road on various dates. The latter, however, was charged with two offences in respect of the same date, the first being at Great Gonerby and the other at Great Ponton. The case against Mr. Resta was first taken, and Mr. T. W. Staplee Firth appeared on his behalf. The evidence in this case showed that the defendant was timed to cover four miles between Long Bennington and Great Gonerby in seven minutes, which worked out at 34.27 miles an hour. At the outset Mr. Firth contended that the summons was altogether wrong, inasmuch as there was no evidence of any excessive speed in the parish of Great Gonerby. The Bench, after a brief deliberation, dismissed the case. In the second case the prosecuting solicitor said the circumstances were exactly the same, more than one parish being concerned. The case was accordingly withdrawn, and Mr. Firth did not ask for costs. The other cases were dismissed without any evidence being called.

John A. Bell, Wellow House, Wellow, who was summoned at Retford for exceeding the speed of ten miles in Carolgate, Retford, got off on a technical objection. Mr. A. P. Williamson, who defended, raised the objection that the necessary three weeks' notice of intention to prosecute had not been given. The Bench upheld the objection and dismissed the summons.

FROM Messrs. Colin Defries, Ltd., Denman Street, Piccadilly Circus, London, W., comes a copy of the catalogue of *Passé Partout* cars the agency for which they have just taken up. Two sizes are being made—a 9-h.p. single-cylinder and a 14-h.p. four cylinder, each model being built in two lengths of chassis. These vehicles are very popular in France owing to their success in various speed trials and hill-climbing competitions held in that country last year.

An interesting test is this week being carried out at the Brooklands track under the observation of the R.A.C., for the purpose of demonstrating the perfect interchangeability of the various parts of the Cadillac horizontal-engine cars. On Saturday last three 9-10-h.p. vehicles were selected at the show-rooms in London of the Anglo-American Motor Car Company, Ltd., and from thence they were driven to Weybridge, where preliminary speed-tests were carried out on the track, each machine covering ten laps, representing a distance of about thirty miles. The cars were then placed in separate sheds, where they were dismantled and the parts all mixed up indiscriminately. The machines are now being re-assembled, the object being to show that the component parts of each are perfectly standardised and interchangeable. It is expected that the work will be completed by to-day (Saturday), after which the re-assembled vehicles are to be subjected to a 500 miles running test on the track.

THE IRISH RELIABILITY TRIAL.

THE Irish A.C.'s Reliability Trial for touring cars will be held from May 21st to 26th, 1908. The itinerary was published in our issue of the 22nd ult. Section I will be open, and vehicles may be entered irrespective of ownership and may be driven by anyone nominated by the entrant. The entry fees range from £6 6s. in classes A B and C, to £14 14s. in classes G and H. Section II. will be limited to private owners and the entry fee will be £3 3s. for those who are not members of the Irish A.C. They may enter at a fee of £2 2s. Entries close on April 7th and at double fees on April 18th.

The vehicles entered will be classified as follows:—

| | |
|-------|--|
| A ... | Selling price with tyres not exceeding £150. |
| B ... | Selling price between £150 and £200. |
| C ... | " " £200 " £250. |
| D ... | " " £250 " £350. |
| E ... | " " £350 " £450. |
| F ... | " " £450 " £550. |
| G ... | " " £550 " £700. |
| H ... | Selling price exceeding £700. |

The bodies must be ordinary touring bodies. In Class D all bodies must have a minimum width over panels at a height of 9 in. above the frame of 3 ft. 11 in., and a minimum length from the back of dashboard to the back of the back panel at a point 9 in. above the frame of 7 ft. 4 in.; and in Classes E, F, G and H the width as above must be 4 ft. 4 in., and length 7 ft. 4 in. In Class D the height of the back panel from the frame to the highest point of upholstery must be at least 2 ft. 7 in.; and in Classes E, F, G and H 2 ft. 10 in.; and these heights must be maintained for at least five-eighths of the width of the body.

The maximum number of marks obtainable for each day's run will be 160, from which will be deducted one mark for each minute or part thereof during which the vehicle is at rest between the time of being ordered to start in the morning and its due arrival in the evening, except in the case of (a) compulsory stops; (b) stops prescribed by the Committee or a duly authorised official; or (c) under special circumstances directed by the observers and subject as herein provided; (d) stops arising from tyre troubles.

The marks for hill climbing will be awarded in the following manner:—

$$\text{H.P. (I.A.C. rating)} = \frac{D^2 S^3 n}{150000}$$

$L = \frac{W}{\text{H.P.}}$ = lbs. per horse power (I.A.C. rating) of any vehicle.

Where D = diameter of cylinder in mm.

S = stroke in mm.

n = number of cylinders.

W = weight in lbs. of vehicle loaded.

$L + 105$ = Time ratio of any vehicle—i.e., the ratio of time the vehicle would do if its performance was relatively as efficient as that of the winning vehicle.

The vehicle showing the highest result obtained by dividing its time ratio by its hill climbing time will be awarded 100 marks, and the others marks in proportion.

The marks for speed test will be awarded according to the following formula:—

$L + 300$ = Time ratio of any vehicle—i.e., the ratio of time the vehicle would do if its performance was relatively as efficient as that of the winning vehicle.

The vehicle showing the highest result obtained by dividing its time ratio by its speed time will be awarded 50 marks, and the others marks in proportion.

WHEN CAR MEETS CAR.

IN an action in which the Cleveland Car Company, Darlington, claimed damages for negligence from Charles Fouda, a Belgian subject, Mr. Waugh, K.C., was for the plaintiffs, and Mr. E. Shortt for the defence. Counsel for the plaintiffs said the plaintiffs were dealers in motor-cars, and also lent them out on hire. The defendant was resident in France. On September 5th the plaintiffs lent out a car to a lady and gentleman to go from Neasham Abbey to York. They were provided with an experienced driver, who knew the road thoroughly. All went well till they reached a dangerous point called Blackman's Corner, four miles from Croft. The horn was sounded on approaching the corner, and immediately the car had rounded it a car was seen coming in the opposite direction, at an excessive speed and on the wrong side of the road. The car was being driven by the defendant. The driver of the plaintiffs' car saw that it was impossible to avoid an accident, but could not turn his car into the hedge because of a double telegraph post, and he stopped the car, practically within five yards. The defendant's car rushed on, and struck the plaintiffs' car. Counsel submitted, from the position of the plaintiffs' car after the accident, and the fact that the glass screen in front was not broken, that his client's car was practically stationary at the time of the impact. The damages plaintiff estimated at £144, and claimed that amount. There was a counter-claim for negligence, which counsel characterised as ridiculous. The jury, after a lengthy absence from court, found for the plaintiffs, and gave them £80 damages for the damage to the car, and £20 for loss of hire, £100 in all.

COMPANY NEWS.

BRIGHOUSE MOTOR COMPANY, LTD.—Capital of £1,000, to take over the business of a motor-car manufacturer, repairer and agent, carried on by Mr. J. H. Hoyle, at Calder Bridge, Brighouse, as "Hoyle's Motor Car and Cycle Depot." Registered office: Calder Bridge Mill, Huddersfield Road, Brighouse, Yorkshire.

TRACTION BATTERIES.—£1,000. 6, Victoria Avenue, Bishopsgate, E.C.

BRITISH BRASIER MOTORS, LTD., with a capital of £11,000, to adopt an agreement to establish agencies in any part of the world for selling and dealing with motors, vehicles, and accessories, and to carry on the business of manufacturers of and dealers in motor-cars, cycles and carriages, carriers of passengers and goods, &c. The first directors are S. A. Bird, E. L. Bennett, R. W. Blackwell, and G. E. Davies.

THE INTERNATIONAL TOURING CAR TRIAL, 1908.

THE following entries have now been received for this event, which takes place in June:—

Class 1.—8-h.p. De Dion (Messrs. De Dion Bouton (1907) Ltd.).

Class 3.—12-14-h.p. De Dion (Mr. J. W. Stocks).

Class 4.—10-12-h.p. Coventry-Humber (Messrs. Humber, Ltd.).

Class 5.—20-h.p. Beeston-Humber (Messrs. Humber, Ltd.); 15-h.p. Coventry-Humber (Messrs. Humber, Ltd.).

Class 6.—30-h.p. Beeston-Humber (Messrs. Humber, Ltd.).

Class 7.—40-h.p. six-cylinder Napier (Mr. S. F. Edge).

Class 9.—40-50-h.p. six-cylinder Rolls Royce (Messrs. Rolls-Royce, Ltd.); 40-50-h.p. six-cylinder Rolls-Royce (Messrs. Rolls-Royce, Ltd.).

Class 10.—60-h.p. six-cylinder Napier (Mr. S. F. Edge).

Also two White steam cars entered by Mr. Frederic Coleman.

The Albion 16 h.p. Van which Messrs. Pettigrew and Stephens, Ltd., General Drapers and House Furnishers, Sauchiehall Street, Glasgow, have had in use since May, 1907, during which time it has covered about 6,000 miles, and the firm calculate that it does the work of at least four horses and two drivers.

OBSTRUCTING THE HIGHWAY.

At the Chester-le-Street Petty Sessions, George Watson, Craghead, has been summoned under the Highway Act for having obstructed Dr. R. E. T. Johnson, of South Moor, on the Chester-le-Street and Craghead highway. Mr. J. A. Williamson, Newcastle, prosecuted on behalf of the Motor Union and the North-Eastern Automobile Association. Dr. Johnson said that on the day in question he was motoring from Chester-le-Street in the direction of Craghead. He was standing at the bottom of the bank which leads to Pelton Fell when the defendant and a number of other men passed him in a trap. Witness noticed that the defendant was under the influence of drink, and on resuming his journey witness kept a careful look-out as he thought it might be difficult to tell on which side of the road he would find defendant. When he overtook the trap it was hugging the side of the road on which witness ought to have passed. The horn was sounded, but no notice was taken of it. The man ultimately stopped his horse and backed it into the motor-car. Defendant, who said he had a nervous horse, was fined 20s. and the costs.

MESSRS. J. E. HUTTON, LTD., have secured the Old Lambeth Baths, Westminster Bridge Road, S.E., as new repair works, in order to cope with the amount of work they obtain in this department, the present establishment at King's Cross being too small. When the necessary alterations have been made, the new premises will form a large and handy shop, 160 ft. long by nearly 60 ft. wide, without pillars, and very lofty, with top light.

FOR COMING EVENTS.

MARCH.

- 11th (W.).—Annual meeting of the Incorporated Institution of Automobile Engineers.
 11th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 12th (Th.).—Annual meeting of the Royal A.C. in the new premises.
 Annual dinner of the Royal A.C. at the Covent Garden Theatre.
 18th (W.).—Annual dinner of the A.A. at the Hotel Cecil, London.
 19th (Th.).—Monthly meeting of the General Committee of the Motor Union.
 21st (Saturday)—28th (S.).—
CORDINGLEY'S THIRTEENTH INTERNATIONAL MOTOR-CAR EXHIBITION will be held at the Royal Agricultural Hall, London.
 21st (Sat.).—Annual general meeting of the Council of the Auto Cycle Union.
 26th (Th.).—Ladies' Automobile Club Day at the Motor Car Exhibition at the Agricultural Hall, London.
 29th (Sun.).—Opening Run of the Southend Motor Club to the White Hart Hotel, Witham.
 31st (Tu.).—Last day for receiving entries, at ordinary fees, for the International Touring Car Race.

APRIL.

- 11th (Sat.).—Annual open Flexibility Contest of the Crystal Palace A.C.
 16th—20th.—Easter Tour of the Motor Cycling Club.
 17th (Good Friday).—Lincs. M.C.C. meet at Mablethorpe.
 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.
 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F.
 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Epping.

MAY.

- 11st (F.).—The Frome's Hill Climb of the Herefordshire A.C.—provisional.
 10th (Sun.).—Targa Florio Race.
 21st (Th.)—25th.—Reliability Trial of the Irish A.C.
 25th.—Industrial Vehicle Competition of the A.C. de France.
 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
 5th—6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
 Start of the International Touring Car Trial of the R.A.C.
 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
 15th—19th.—Scottish Reliability Trial.
 27th (Sat.).—Hill climb of the Midland A.C. at Shelsley Walsh.
 28th. (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
 6th (M.).—Grand Prix A.C.F. (Voiturette section).
 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club.
 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

THE KENLEY MOTOR FATALITY.

MR. JUSTICE WALTON, in charging the grand jury at the Surrey Assizes, alluded to the case in which Duncan Albert Brown, of Kenley, was charged with the manslaughter of Arthur Borer at Kenley on January 11th. He said the case appeared to be one that presented features of some difficulty. It was one in which a man walking along the road was knocked down by a motor-car and killed, the car proceeding on its way without stopping, and disappearing out of sight. There was a good deal of evidence that when the vehicle struck the deceased it was going at a somewhat reckless pace, but the most important question to be decided was whether the accused was the man who was driving it. The grand jury returned a true bill against the accused, who was indicted at the Assizes. On Monday, after a three days' hearing, the jury were discharged, having been unable to agree. The accused was bound over in £100 to come up for trial at the next assizes.

WITH regard to Miraculum, we are asked to mention that it should be clearly understood that the preparation as supplied for cycles, motor-cycles and cars is sold in three distinct grades, and buyers should specify for which purpose it is required. Even in cars there is a difference according to the size of tyres.

ROAD REPORTS.

CALDER.—The Calder District Committee has decided to ask the County Council to apply to the Secretary for Scotland for the imposition of a ten-mile speed limit for motor-cars in certain populous places in the district.

PORTSMOUTH.—The roads to the east side of Portsmouth are reported to be in a bad state, and flint is said to be frequently found in many places.

ROMSEY.—The county surveyor has completed the repair of the main roads in this district.

POLICE TRAPS.

REDHILL is again the centre of police activity against motorists, and a trap is in frequent operation near the 20th milestone from town.

THE police have a measured distance in Latchmere Road, Battersea. THE Staffordshire police are reported to be very watchful on the Lichfield road at Freeford.

BUSINESS NEWS.

WE are informed that the German Guide Book issued annually by the Continental Tyre and Rubber Company (Great Britain), will be published early in April. This book is replete with authentic information and contains maps, routes, &c., and in fact is essential to the motorist who contemplates touring in Germany.

A NEW motor spirit known as "P.G.R." is being put on the English market by La Société des Petroles de Grosnyi (Russie), of Leadenhall House, London, E.C.

ACER, LIMITED, motor and general engineers, Grosvenor Road, Hanwell, W., have laid down special machinery for internal and external grinding; they are also making a speciality of motor cylinder work for the trade, grinding out the bores and fitting new pistons with great accuracy, and undertake general motor trade repairs, such as gear cutting, &c.

A NEW motor spirit made from shale, and known as "Strathelyde," is being put on the market by Messrs. Clarkson, Thomson and Co., Kinning Park, Glasgow.

AMONG the novelties just brought out by the United Motor Industries, Ltd., 45 and 46, Poland Street, W., are the "Bomete" puncture repairing plugs, the "Alpha" compression valves, the "Castle" portable turn-table, and the new "Castle" cigar lighter with renewable top.

FOUNDED originally for the adjustment, overhaul and repair simply of automobiles, the Panhard-Levassor Engineering Works at Acton Vale have now come to be almost as busily employed on general engineering jobs as on work connected with cars.

THE Dunlop Pneumatic Tyre Company (Limited) inform us that French and German Dunlop tyres sold on the Continent are identical with the home made tyres. The material is of the same standard of excellence, the processes through which it passes are precisely the same, and the same scrupulous supervision is given to every phase of production. The sole difference, indeed, may be said to lie in the lettering moulded along the sides of the outer covers.

AN attractive pamphlet emphasising the motor victories that have been won on "Shell" motor spirit has just been issued. This should give confidence to many not yet using this spirit to give it a trial.

THE Bombay Motor-Car Company have just delivered a 28-h.p. Daimler, with body by Maythorn, to the agent to the Governor-General in Rajputana, the Hon. Mr. E. G. Colvin, C.I.E.

THE SOUTH WALES MOTOR COMPANY have lately opened a large branch depot at Monmouth Road, Abergavenny, and have one of the finest garages and workshop equipments in the district, accommodation being provided for twenty cars. Vulcanizing and accumulator charging are given special attention. The head office and works of the company are still at Cardiff.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, MARCH 14, 1908.

[No. 471.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

ELSEWHERE we record an important decision by the Metropolitan Water Board with regard to the charges made to motorists for the water wherewith to wash their cars. Coming at a time when additional imposts from the Treasury are threatened the new charge seems absurd and wholly irrational. If there were a general conspiracy to drive the motorist from the road, the matter could scarcely have been better conceived. But, looking at this water charge alone, we trust the matter will be brought well forward by the motoring organisations. Apparently none have yet heard of the increased impost, or we should have been circularised on the subject. But now that we have given publicity to the matter, which seems to have escaped general notice, it is to be hoped that Lord Welby and his friends will be informed that to charge the private motorist £1 per car per annum for water is wholly out of proportion to the needs of the case. At the outset we do not like the system of preferential treatment as between the horsed and the mechanical vehicle. That is a plan not couched in the interests of the development of industry. The horse will not be saved by taxing the motor-car at a higher rate for its water. On the other hand, the man who contemplates buying a car will assuredly reckon up all his costs; and now, if in London £1 is to be added for water, his bill promises to grow beyond reason. Here again there is need of differentiation, for the middle class man who uses his car for week-end runs in the summer and keeps it in the motor house all the winter is not likely to seriously deplete the water supply. And yet he is to be called upon to pay this precious sovereign to a Water Board which has made the charge without any adequate discussion with practical motorists. What with the Water Board, the Inland Revenue, the County Registration Authorities, and other official bodies seeking to lighten the pockets of the motorist, a man of moderate means may be compelled to sell his car and resume acquaintance with Shanks's pony.

Motor Legislation.

WE have yet to hear from any motorist who will decline to assent from the clearly worded resolution in which the committee of the Royal A.C. have declared themselves on the financial proposals with regard to automobiles that are being hatched in the Treasury incubator. This is to the effect that the R.A.C. "sees no justification for any additional taxation being imposed upon motor-cars." Neither do we, neither does the man in the car. It is "the man in the street" who has been startled by the screeching of some ancient horn, or has been caused to run by the accelerated speed of a machine driven by a dare-devil chauffeur, who calls for further taxes on motor-cars. If he is a profane person, he prefaces the word "motor-car" with unprintable adjectives. The point of view of the Chancellor of the Exchequer is somewhat different to that of the pedestrian or the motorist. He wants money. Whether it comes from taxing monosyllables or motor-cars he cares little so long as the result runs into seven figures. But, apparently, it has become a matter of common acceptance that

the motor-car is in the centre of the Chancellor's target, and Mr. Asquith has the reputation of attaining his aim. Last year he hinted that he might seek the motorist; this year he will probably waylay him.

Reasons against Increase.

THROUGHOUT the year we have maintained the position that, (1) to increase the difficulties of a growing British industry in its early stages was inimical to the best interests of the country; (2) the motorist, by reviving the prosperity of the countryside, as is proved by the renovation of many hotels and other places on main roads, is doing much for the national welfare; and (3) that the present taxation and licences in connection with motor-vehicles is sufficiently high to warrant a policy of non-interference. This tripartite argument has been developed in various ways, and we have taken care that the views thus formulated have been brought directly under the notice of the Treasury officials, as well as those M.P.'s who follow the re-adjustment of the nation's financial affairs from time to time. Correspondence has proved the interest, and the result should have justified the care with which the education of the official mind has been unostentatiously undertaken.

No Further Taxation Necessary.

SUDDENLY, however, the calm consideration of the subject has been rendered impossible, and motorists find themselves in a whirlwind of opposing policies, in which the various sections of the motor movement are being blown about like the dust, and the issue is obscured. Our Letter Box — from which a selection has appeared in recent issues — testifies to the varied views entertained by those whose interests are above trade and party cries. The opinion has been practically unanimous against further taxation; and those who are inclined to the view that they should pay more are careful to suggest the use to which the extra taxation should be applied. Unfortunately, however, all precedent—save one solitary instance—is against such a policy. The Chancellor wants the money for the Treasury. He is not likely to hand over contributions to any other department for special purposes as the result of new impositions; hence the rallying cry of motorists should be against any further taxation. It is a mistake to overload the subject with technicalities that are confusing to the plain politician who has never seen a car dismantled. A clear issue should be presented to the conference which will be held next week, viz., that any proposed further taxation is unnecessary and should be resisted. Representations to that effect should be made to all M.P.'s without delay, and throughout the country motorists should write at once to their local members in support of such a view.

The Irish View.

MR. E. WHITE, the hon. secretary of the Irish A.C., has given the view of the matter as it presents itself to the automobilists of the Emerald Isle. He rightly asks:—Why should the industry be further taxed at the present juncture? and goes on to say that the members of his club have for a considerable time past been relieving the District Councils from the expense (imposed upon them by statute) of erecting signs

throughout the country, and "have been encouraging tourists and others to visit this country and spend their money here." That this good work would be impeded by taxation is a necessary consequence. The injustice of imposing further taxes must appeal to Irishmen of every shade of politics, and it is of the greatest importance that the interest of all members of Parliament representing Irish constituencies should be at once sought for by those interested in the motor movement, so that when the proposals of the Chancellor of the Exchequer are brought forward they may be met with strong opposition.

The Motor-Cab.

THE motor-car has conquered; the motor-cab and the motor-bus are now pursuing their way into the ordinary traffic of the streets of great towns. On Monday, round the festive board at the Holborn Restaurant, representatives of half-a-dozen motor-cab companies in London, Paris and New York met to congratulate each other on the position attained. The combined capital of the concerns is two millions sterling, and insurances against third party risks by one London company—the United—alone total £20,000 a year. Apparently the troubles of the motor cabby with the police are almost as great

Lady Edward (Spencer) Churchill on her Coventry-Humber 15-h.p. Landaulet. (Campbell-Gray. Photo by)

as those of the driver of the motor-car along country roads, for when a speaker advised the drivers to keep good friends with the police someone called out, "We can't; they won't let us." Then came the information from Mr. Edgar Cohen that he had recently interviewed Sir Edward Henry, the Chief Commissioner of Police, who suggested that the men should not smoke when on their cabs and that they should respond promptly to calls from the ranks. Complaints on both these points have been made; we hope an *esprit de corps* will be created among the men that will sustain the credit of the taximeter cab and render such suggestions unnecessary.

Commercial Vehicles.

AT length the last scene in the Commercial Vehicle Trials of the Royal A.C. has been enacted, and on Friday, the 6th inst., Mr. C. D. Rose, M.P., presented the distinctions that were won by some competitors. As will probably be remembered by many of our readers, fifty of the sixty vehicles entered completed their task. The judges stated that there has been improvement all round during the past few years, especially in the matter of wheels. For useful loads it was thought that the tractor was the most economical for general haulage, but when higher speed was required the internal combustion engine

lorry and rubber tyres became a necessity. A small engine could with advantage be employed where a high speed was not required. The regularity of running under reliability was remarkable, and the condition of the majority of the vehicles after the trials was on the whole satisfactory. The result of the trials has undoubtedly demonstrated the advantage of motor haulage and the great usefulness of some of these vehicles. Mr. Rose hoped that some sound practical commercial advantage would result to the competitors, a detailed account of whose fortunes in the Trials is given in the current "Industrial Motor Review."

A Lakeland Adventure.

MANY have been the motoring adventures that have taken place in the Lake District. Last week an exciting incident occurred to a party of musical folks who are attending rehearsals for the forthcoming Westmorland Musical Festival. About eleven o'clock one night the party started out to motor from Kirkby Stephen over the hills to Kendal, a lonely and uninviting journey of twenty-four miles. Snow lay to a great depth in the narrow moorland gorges, save in the beaten tracks, and, by some mischance, a wrong turn was taken on the wilds of Ashfell, with the result that the car became hopelessly embedded in an immense drift. All efforts to liberate the vehicle proved unavailing, so there remained no other course for the stranded party but to tramp back in the snow to Kirkby Stephen, where they arrived during the small hours of the morning.

Fire Dangers.

DURING last year thirty-one motor-cars were reported to the Metropolitan Fire Brigade as having been damaged by fire. Of these 21 were damaged while on the road. The causes of the fires were given as follows:—Overflow of petrol, 15; vapour of spirit coming into contact with flame, 5; defective electric circuit, 2; light thrown down, 2; defect in flue, 1; overheating of gas stove, 1; friction of machinery, 1; hot ashes, 1; spark from traction engine, 1; unknown, 2. The overflow of petrol also caused two motor-cycles to catch fire and two motor houses to be burned. A third motor house was burned owing to defective construction.

The A.A. and the Police.

Now and again rumours are heard as to the displeasure of the police authorities with those of the Automobile Association, who are desirous of checking too speedy motorists, and at length Captain Sant, head of the Surrey Constabulary, has sent an admonishment to Princes Buildings, Coventry Street, W. This has been duly considered by the committee of the A.A., which has offices there, and a categorical reply has been forwarded to the Chief Constable, which should disabuse his mind of evident misconception. If Captain Sant intended to suggest that the patrols were to "encourage reckless and inconsiderate driving," the committee "emphatically deny that any such object was present in their minds." Probably the better course for Captain Sant to adopt will be to accept the conclusions of the letter, and pursue his way with the co-operation of all law-abiding motorists. And the scouts of the A.A. can be extremely useful to the police if they will use them aright.

The 1908 Event.

FROM the paucity of the entries made thus far, it is evident that manufacturers are not wholly agreed as to the wisdom of many of the regulations for the Club event of the present year. We are of opinion that reliability is now so generally associated with automobiles that the old type of trial is no longer necessary; and, although it would not have given the popular advantage of a spectacular finish, the race on the Brooklands track might well have preceded the grand parade to the Highlands and back again. The purchaser of a car is now concerned

as to its silence, engine flexibility, brake power, consumption, economy so far as the tyres are concerned, and similar points of comparison between various types. There are many things among the objects aimed at in the forthcoming trial which, as in Euclid, the motorist now takes as granted, and among these is Reliability.

Motor-car Imports and Exports.

FEBRUARY proved a very quiet month as far as imports of foreign motor-cars and parts into this country are concerned, a decrease, as compared with February, 1907, of £10,678 being recorded. Of complete cars only 381 were imported during the month, of the value of £138,367. The number of chassis imported was 326, valued at £89,417, while parts were responsible for £141,814, giving a combined total for February last of only £369,598, as against £380,266 in the corresponding month of last year, and £396,422 in February, 1906. Turning

cations for extending the prestige of the concern were well shown in the avidity with which they studied the motor-car and its influence on the carriage builder soon after the "man with the red flag" had been sent to the "land of forgotten things."

The Bond.

HAVING regard to the way in which the Society of Motor Manufacturers has interpreted the Bond which many of its members have signed, the Motor Exhibition which will open at the Agricultural Hall, London, on Saturday next, the 21st, will be a revelation of the size to which the motor trade has grown. It will prove the need for the Cordingley Show and should cause some of those who have advocated "one show only" to realise that the industry is now too vast to be controlled and confined in some parochial area. More than that, many think with Mr. Henry Sturmev, that the Society of Motor Manufacturers and Traders has laid down the law in a most sweeping

MOTORING IN THE DUTCH EAST INDIES.

A 15-22-h.p. Spyker, a 40-h.p. Fiat Touring Car and a 40-h.p. Fiat Motor Lorry at Tosari.

[De Auto.

now to the section relating to the exports of British automobile productions, these also show a slight decrease—from, in the aggregate, £101,859 in February, 1907, to £99,920 last month. Altogether 187 complete cars (£68,211) and 8 chassis (£2,679) were despatched from this country in February, as well as parts to the extent of £29,080.

A Continuous Record.

MORE than many branches of industry the coachbuilding trades have maintained their personal character, and the successive ownership of important firms by several generations of a family is a familiar fact with regard to British carriage work. While admiring the fine new premises of Messrs. Thorn in the West End of London the other day this fact was brought conspicuously to our notice. The house was founded in 1824 by William Thorn, to whom succeeded W. T. Thorn, master of the Coach Builders' Company in 1865, and F. Thorn, who occupied that distinguished position in 1881. Since 1882 the partners have been Messrs. W. T., O., W. and F. C. Thorn, whose qualifi-

fashion with regard to the Bond. "Certainly in a more sweeping manner than was originally intended," he writes, "for it has made it to cover a much wider sphere of influence than, I believe, most Bond signers had any idea of when they first put their signatures to it, and, further than this, it has interpreted the Bond to read the same way for commercial cars as for pleasure cars." Anyhow, the forthcoming Show at the Agricultural Hall is again attracting most of the leading firms, and will present an appearance of varied interest to all concerned in automobilism.

DURING some motor-car races near Cairo on Tuesday, organised by the Egyptian Automobile Club, an accident occurred in the fourth race, owing to a driver trying to avoid a policeman on the course. The car swerved towards the crowd, killing, it is reported, one spectator, besides the policeman, and injuring six others. The Duke of Connaught arrived a few minutes later, but did not remain. The Khedive also left, and the races were discontinued.

A JAUNT IN NORFOLK.

(Concluded from page 29.)

THE Hillington road can be followed as far as Appleton, from whence a turning to the right enters the main road above Castle Rising. This fine Norman stronghold was built by William D'Albini, and Henry VIII. exchanged it for some Suffolk estates with the Duke of Norfolk, in whose family it still remains. It is surrounded by old Roman or British earth mounds, on which are some fine ash trees. After crossing a stone bridge, the remains of a Norman gateway give admission to the inner bailey. A flight of steps leads to an old room containing a famous old fireplace; in former days a door led from here to the great hall. Two logs of wood with chains attached are sure to claim attention. They were known as "Roaring Meg and Pretty Betty," and were utilised for the safe custody of prisoners, who were fixed to them by the chains, and were allowed to wander at their will provided they dragged or carried the wood blocks with them. Portions of the basement still exist, and in it the bases of supporting columns have been dug out. There is also a well, which in old days enabled the inhabitants to get water if besieged. From the battlements a fine view can be had of the sea, and the Lincolnshire coast can be seen. Queen Isabella, the mother of Edward III., was imprisoned here, and seemingly she was permitted to visit the Shrine at Walsingham, for in the Chamberlain's account it is stated that the Lynn Town Board had to pay certain sums for wine, bread and oats when she went on a pilgrimage there. The village green with a cross on steps should be seen; adjoining are the almshouses, the inmates of which wear a most picturesque attire—red cloaks, with high-peaked hats of James I. period. The church has a quaint steeply roof and is ornamented with twisted shafts and a kind of lozenge. Above the window of the west door are some fierce-looking heads surmounted by a small circular window; the carving of the font, too, is excellent.

The road from here is bordered by coverts belonging to Rising Hall, and crosses Ling Common. At South Wootton a stop may be made to visit the old church, where there is a fine Norman font, supported by circular shafts and having some gargoyle-like carvings at the angles of the bowl. Another four miles and the quaint old port of Lynn is reached. One might well imagine oneself in some old-fashioned Dutch or Belgian town, but in England No! Even in Saxon times Lynn was a flourishing port, and to-day, as a proof, the Guildhall, Custom House, Town Gate and old residences of its merchant princes still remain. Daniel Defoe, writing in 1722, says: "A rich and populous port-town, having the greatest extent of inland navigation of any port in England, London excepted, importing more coal and wine than any other port in the country, while its trade with the Baltic and Norway was immense." A walk should be taken along that well-wooded promenade, "the Walk," along the old mound to the Red Mount Chapel, the stone vaulting of which is of exquisite design. A little beyond is the only remaining city gate, near which are some quaint old houses with gables. At the end of the London road is the Greyfriars Tower, which is all that is left of a Franciscan tower founded in 1264. Not far off is the Grammar School, where Eugene Aram was an usher. He was arrested some fourteen years after his crime was committed. Those who heard the late Henry Irving recite Hood's lines will, I know, be interested in seeing the spot:—

Two stern faced men set out from Lynne,
Through the cold and heavy mist;
And Eugene Aram walked between
With gyves upon his wrists.

The Town Hall should be visited, and in the strong room can be seen, among other treasures, King John's cup. This was not the property of our King John, his plate probably still lies at the bottom of the Wash; the one in question belonged to John of France, who was a prisoner at Castle Rising. The figures on the lid and base represent a hunting party and are most beautifully cut. It appears that even in mediæval times dogs and cats were known to carry the plague infection, for among many quaint town documents preserved is one that orders the destruction of these pets during the time of pestilence. It's wording is interesting:

Forasmuche as it hath pleased the Allmightie God to begynn to send us His visitation of sickness amongst us, and that dogges and cattles are verie unfit to be suffered in this tyme, every inhabitant shall forthwith take all their dogges and yappes and hang them or kill them.

The church of St. Margaret must be seen, if for nothing else, anyway to inspect the brasses in the S.W. tower, one with the portrait of the merchant Walsoken and his wife, both clad in the costume of the period—1349. At the sides are the twelve apostles, and below is represented the gathering of apples on a monastic farm. The other, which is in a much better state of preservation, depicts Robert Braunchie, the mayor, and his two wives with eight weepers at the sides, each female having a little dog with a collar of bells at her feet. Below is the scene of the mayor's banquet to Edward III. The King has in front of him King John's cup, while females are bearing in the dressed peacock, and minstrels are encouraging appetite by their melody. In St. Ann's Street is another church, St. Nicholas. The beautiful roof and the elaborately decorated south porch, with a figure of the Deity on the central boss, should be seen, as well as the east and west windows. On the floor are some slabs in memory of various members of the Robinson Crusoe family. According to Mr. Walter Rye the poet Chaucer was a native of this town.

St. Margaret's Church, King's Lynn.

The return journey to Cromer may be made through Wootton, Massingham, Raynham, the seat of the Marquess of Townshend, and at whose mansion can be seen Salvator Rosa's Belisarius, which was presented to the Viscount Townshend by Frederick the Great, and is said to be the finest work of that master in this country. From here, *via* Fakenham and Holt, the main sea coast road may be picked up at Sheringham, passing Pretty Cromer on the way. C. T. W. H.

FIRST MOTORIST: "They tell me your chauffeur is an angel." SECOND MOTORIST: "I guess he is now; he lit a match last night to see if the petrol tank was full."

A NEW fire extinguisher, known as the "Phoenix," has lately been put on the market by Messrs. Henry Simonis and Co., of Norfolk Street, Strand, W.C. The apparatus combines many improvements, which should make it popular. Most extinguishers contain glass bottles of chemicals, which have to be broken before the apparatus can be used; the "Phoenix" is discharged by a steel cartridge containing liquid carbonic gas, which is hermetically sealed, and yet remains at all times controllable. There are, therefore, no sulphuric or other dangerous acids of any kind, and the apparatus is perfectly harmless, except to a fire, which it quenches with surprising ease, a horizontal jet of 45 ft. or a vertical jet of 30 ft. being thrown.

CONTINENTAL NOTES.

The event of the week in French aeronautical circles is the prizes which Messrs. Michelin, through the Aero Club de France, are offering to encourage the development of aeroplanes. In the first place, a £400 challenge cup is to be competed for annually, for ten years, the winner, in addition, securing a money prize of £600. The conditions have not yet been fixed, but one clause is to the effect that each year the distance to be covered will be doubled. The second part of the scheme is the offer of a prize of £4,000 for the first aeroplane which, starting from any point in the Department of the Seine or Seine et Oise, sails round the Arc de Triomphe, Paris, and then makes for Clermont

The example set by the Automobile Club de la Sarthe in keeping a comparative record of accidents caused by horse-drawn vehicles and motor-cars in their district is being copied by several other automobile clubs in France, among them being the A.C. du Rhone, and the A.C. du Gard. In the Sarthe department,

during the period from October 1st, 1907, to February 29th last, there were 118 accidents due to horse vehicles, causing the death of fifteen persons and injury to 115 others. During the same periods there were six motor-car accidents, none of which had fatal results, while only six persons were injured.

An Industrial Vehicle Trial in Russia.

The Moscow section of the Russian Automobile Club is organising a trial of industrial motor-vehicles for May 24th next. It will be held over a 72-mile course, and categories will be provided for (1) vehicles for loads up to 1.6 tons, (2) ditto from 1.6 to 2.5 tons, and (3) ditto over 3 tons. A hill-climbing test is comprised in the programme.

The French Industrial Motor Vehicle Trials.

The French Ministry of War is offering a number of prizes to the successful competitors in the reliability trial of industrial

Belgian Motor-Car Imports and Exports.

The imports of motor-cars and parts into Belgium during January last attained a value of only £5,020, as compared with £7,116 in the corresponding period of last year. On the other hand, the exports of motor-cars and parts from Belgium advanced from £15,496 in January, 1907, to £23,872 this year.

Miscellaneous Items.

A dozen entries have been received for the motor race to be held at Verona, Italy, on the 15th inst.—Messrs. Laurin and Klement, of Jungbunzlau, Bohemia, have just supplied two motor-cycles to the Mexican postal authorities for use in connection with the collection of the mails.—King Gustave V. has conferred his royal patronage on the Swedish Automobile Club.—It has been decided not to hold an automobile meeting at Scheveningen, Holland, this summer.—The Steiermark

Motor-Buses at a Race Meeting at Berlin.

vehicles to be held in France in May next. It is also announced that eight or ten of the competing vehicles will be purchased by the military authorities at the end of the test.

Motor Racing on the Ice.

The Royal Swedish Automobile Club has just held a series of kilometre races on the ice at Djursholm, near Stockholm. Twenty-three cars, divided into three classes, put in an appearance. The best time, 44 2.5 sec., was made by Mr. Lindström on a Darracq. In the 30-40-h.p. car section the winner was Mr. Hydens on an Opel (51 sec.), and in the light car category Mr. Hystrom's Dürkopp (49 sec.).

Public Services in France.

A public motor-car service has recently been established between Enghien, St. Gratien and Deuil. The round trip is only one and a half miles, but thirty-seven journeys per day are made. The vehicles employed are of the 12-h.p. two-cylinder type, and have accommodation for eight inside passengers.

Automobile Club is organising a hill-climbing competition for May 31st next on the Ries road, near Gratz, Austria.

ONE of the latest productions of the Crypto Electrical Company, of Bermondsey Street, London, S.E., is a continuous-to-continuous current transformer, which enables those motorists having an available source of continuous current electricity to charge their ignition or car-lighting accumulators in the most efficient possible way. Two sizes are being made, one having a capacity on the secondary side of 7 amps. at 15 volts, and the other 5 amps. at 10 volts, the primaries being wound for any voltage up to 250. The larger of the two machines is intended for use in public garages, and is capable of charging as many as nine accumulators at once. The smaller type, however, has been designed for charging the batteries in a private motorist's garage. It is very small and compact and substantially made and will work from any existing lamp holder, its capacity being sufficient to charge two motor-car cells.

THE SETTING OF VALVES.

THE article we published in our issue of January 11th last with regard to the setting of valves of petrol engines, in which we gave details of the practice adopted in seven different motors, has created considerable interest. In fact, we have received numerous requests to publish diagrams indicating similar information with regard to the engines of other well-known cars, a number of which accompany the present contribution to the subject. As we have already pointed out, there is a remarkable want of uniformity in the timing adopted by the different makers—no two firms having apparently exactly the same views on the subject. At a first glance it would seem that the question of correctly setting the inlet and exhaust valves of a petrol engine is no very difficult matter, since the functions of the cycle of operations—suction, compression, explosion and exhaust—are well defined by the position of the piston, and may readily be traced by anyone who understands the four-cycle principle of the internal combustion engine. There are, however, certain conditions which are likely to be overlooked by the amateur which have a considerable bearing on the action of the motor, especially when running at high speed. These are the size of the valves, the

Fig. 1.—Diagram of Dennis Valve Setting.

time taken in opening and closing them, with the incidental momentary throttling of the mixture in consequence, the possible restriction of the gases in their passage through the ports, causing, in poorly designed motors, the phenomenon which is known as "wire drawing," and the inertia of the gases or their momentum, which is due to the velocity of their flow to and from the cylinder.

There are thus many considerations to be taken into account in fixing the points of opening and closing the valves, and, as motor designers have each their own pet ideas on valve setting, some time must elapse ere any great degree of uniformity can be expected. Hence, as the details given below are, in the majority of cases, now published for the first time, owners of the cars referred to will probably find it useful to make note of the timing of their particular engine in order to facilitate the work of re-erection should it become necessary at any time to dismantle it.

The Dennis Valve Setting.

Still another diagram is that which has been furnished us by Messrs. Dennis Bros., Ltd., of Guildford, of the valve setting they adopt on their 28-h.p. and 35-h.p. four-cylinder engines of a bore of respectively 110 mm. and 120 mm., the stroke in

both cases being 130 mm. As will be seen from Fig. 1, the inlet valve is arranged to open late—30 deg. down on the suction stroke of the piston, and to close late—20 deg. up on the compression stroke. The setting of the exhaust valve gives an early opening—40 deg. from the bottom of the explosion stroke while it remains open, 10 deg. beyond the end of the exhaust stroke—that is, 1 mm. down on the suction stroke.

Fig. 2.—The Arrol-Johnston Valve Setting.

The Arrol-Johnston 24-30-h.p. Car.

The New Arrol-Johnston Car Company, Ltd., of Underwood, Paisley, have furnished us with a diagram (Fig. 2), showing the valve setting on their 24-30-h.p. four-cylinder car. It will be seen that in this instance the inlet valve is timed to both open and close late—20 deg. down on the suction stroke, and a similar distance up on the compression stroke respectively. As for the exhaust valve, this opens early—35 deg. from the bottom of the firing stroke, and closes late—5 deg. down on the suction stroke.

Fig. 3.—Diagram of Valve Setting of Daimler 28-h.p. and 30-h.p. Engines.

The Daimler Cars.

Fig. 3 depicts the setting adopted by the Daimler Motor Co., Ltd., for their 28-h.p. and 30-h.p. four-cylinder engines. From this it will be observed that the inlet valve opens late—15 deg. down on the suction stroke of the piston, and closes late—25 deg. up on the compression stroke. The exhaust valve opens early—35 deg. before the end of the explosion stroke, and closes late—5 deg. down on the suction stroke.

The Fiat Motors.

Fig. 4 shows diagrammatically the valve setting adopted on the engines of Fiat cars—one of the most successful in the principal races of last year. As will be seen, the setting closely approximates that adopted in the Star cars, the inlet valve being timed to open and close on the dead centre, i.e., at the top and bottom of the suction stroke respectively. The exhaust valve is

Fig. 4.—Diagram of Fiat Valve Setting.

arranged to open early, 45 deg. from the bottom of the firing stroke, while it closes on the dead centre at the end of the exhaust stroke.

The Vauxhall Cars.

The diagram of the setting of the valves of the engines in the Vauxhall cars, which has been furnished us by the makers, is one of the most novel of all that we have received. As will be seen, they have marked off the circle in divisions corresponding to those of a clock or watch face, and have shown the valves to open and close at points denoted by so many minutes. From

Fig. 5.—Diagram of Valve Setting of Vauxhall Motors.

this it is easy to deduce that the inlet valve opens late—viz., 30 deg. down on the suction stroke of the piston, and closes late—24 deg. up on the compression stroke. As for the exhaust valve, this is timed to open early—36 deg. from the bottom of the firing stroke, and to close late—15 deg. down on the suction stroke.

The Albion Cars.

The valve setting adopted by the Albion Motor Car Company on the engines of the Albion cars is arranged to give a long period of opening of both the inlets and the exhausts. Thus the inlet valve is open for 190 deg. of the circle, opening 10 deg. down on the suction stroke of the piston and closing 20 deg. up on the compression stroke. That a good scavenging of the exhaust gases from the cylinder should result is evident from the fact that the exhaust valve is open a full stroke of the piston plus 56 deg., the opening taking place at a point 48 deg. before the end of the explosion stroke, and the closing 8 deg. down on the suction stroke. In sending us these figures Mr. T. Blackwood Murray, B.Sc., adds:—"It is, however, to be clearly borne in mind that the valve setting must not be arbitrarily fixed the same for all engines, but must be fixed with due and careful regard to the size of the valves and proportions of inlet and exhaust pipes, and also with regard to the speed at which the engine is desired to give maximum power. For high speed it is necessary to retard the phase of the suction valve."

The Germain 14-h.p. Chainless Car.

Capt. Theo Masui, the British Agent-General for the Germain vehicles, has kindly furnished us with the accompanying diagram (Fig. 6) showing the valve setting adopted in the Germain 14-h.p. four-cylinder chainless car. The drawing has been prepared in a different way to the others that we have

Fig. 6.—Diagram of Valve Setting of Germain Motors.

already published, but a careful examination of it will show that, as in the Larrad setting, which we illustrated in our issue of Feb. 1st, the inlet and exhaust valves are for a brief period both open at the same time. Unfortunately no dimensions are given on the diagram, but we have scaled it and find that approximately the inlet valve is timed to open late—4 deg. down on the suction stroke of the piston, and to close late—35 deg. up on the compression stroke. As for the exhaust valve, this is timed to give a long scavenging stroke; it opens 44 deg. before the end of the firing stroke, and closes 10 deg. down on the suction stroke.

The Ariel Cars.

In the engines of the Ariel cars the exhaust valve is arranged to commence opening 45 deg. from the bottom of the explosion stroke of the piston, and closes 5 deg. from top of suction stroke. The inlet valve opens slightly late, viz., 18½ deg. down on the suction stroke; it also closes late—42 deg. up on the compression stroke.

MESSRS. R. M. WRIGHT AND CO. have lately extended their premises at Newland, Lincoln, to accommodate several motor-cars, and add to the convenience of the premises.

SOME USEFUL NOTES.

IGNITION MAGNETOS are frequently so arranged on the car that the entire device may be detached by simply loosening one or two screws. Before it is removed, however, care should be taken to see that the driving gear is plainly marked to indicate the proper method of reassembling, as otherwise it may be practically impossible to replace it without going over the timing in exact detail.

It is a good plan to occasionally see that the nuts of the clips holding the springs of a car in position are tight. Loose spring clips are the cause of many broken springs, for they allow more stress to be thrown on the centre of the leaves than there should be. If the clips are perfectly tight the portion of the spring between them is practically a solid piece, but if one of the clips is loose there is much more individual movement among the leaves.

A CYLINDER that is becoming overheated, either from a stoppage of the oil supply or any other cause, makes its trouble known by a scraping, grating noise at each stroke of the piston as the dry metals rub against each other. A loss of power can also be noted, and the driver should get down at once and ascertain what the trouble is. To keep on forcing the engine to run may mean a badly scored cylinder as well as a seized piston, and the many difficulties resulting therefrom.

A USEFUL addition to the tool-box of a car is a ball of twine, or at least a quantity of it, say fifteen to twenty yards. About an eighth of an inch is the best thickness, though a larger size should preferably be carried in addition. One or two uses to which twine can be put are given below. There are still some cars in use in which the high tension leads are not encased, and whose users frequently suffer from short circuits due to chafing and consequent destruction of the insulation. When signs of chafing appear, twine should be wrapped closely around the part. It is cheaper to chafe out twine than to run down batteries. Twine will also be found useful in binding a steering wheel that shows a tendency to split; binding the rim with twine checks any tendencies in this direction, and forms a comfortable hand grip.

THE use of a poor quality of lubricating oil leads to a diversity of evils, apart from inferior lubrication. Carbon deposits will form on the combustion chamber walls, on the piston head, and on the points of the sparking plug. Ignition will be interfered with and finally stopped through short-circuiting across the insulation of the plug. The deposit may, in time, become so thick as to hold sufficient heat from one explosion to another to cause pre-ignition, which is liable to cause the motor to run with more or less "knock." If pre-ignition is suspected a test can be made by cutting out the ignition current. If this fault is not present the motor will stop; but if pre-ignition is occurring the motor will run without the assistance of legitimate aids to ignition. Shutting off the supply of fuel will bring the engine to a standstill.

USUALLY, after a car has not been out of the stable regularly during the winter months, the bright parts are all dull and tarnished; they may, however, be restored to their pristine brightness by the following cleaning and polishing method:—First, apply a weak solution of oxalic acid and water to the tarnished surfaces by means of a cloth upon a handle or stick. Any acrid accumulations are then loosened and may be removed by wiping. After this metal polish such as is ordinarily used for brass work should be applied with a linen cloth, and the polishing finished with soft woollen cloths. Tripoli powder applied by means of a piece of felt should be used if the surfaces are slow to respond to polish. A good carriage worker's metal polish is made of whiting, 20 parts; soda, 1 part; citric acid, $\frac{1}{4}$ part, moistened with water for use.

THE MICHEL CLUTCH.

WE illustrate herewith a new design of friction clutch for motor-cars known as the "Michel," which is being made by the Ateliers Rondet-Schor, of Rue du Banquier, Paris. The object of the designer has been to produce a clutch which shall not only be simple and able to withstand rough usage, but one which shall not require adjustment over a long period.

From Fig. 1 it will be seen that fixed to the flywheel of the engine is a hollow drum A, in contact with which

Fig. 1.—Sectional Views of Michel Clutch.

A. Outer casing secured to engine flywheel wheel.
B B'. Friction shoes.
C. Eccentric cone.
D. Helical clutch spring.
E. Plate spring.
G. Stop projection on cone C.

are two aluminium shoes B provided with fibre contact strips. The shoes are entirely independent of each other and are forced against the walls of the drum by the intermediary of a metal cone C on the shaft F, the surface of the cone being eccentric to the crank shaft. The clutch is held up to its work by a spring D, a second one E of a special form controlling the progressive engagement of the frictional surfaces.

With the drum rotating in the direction shown by the arrow there is a slight play between it and the shoes B when the clutch is disengaged. By releasing the pedal, which is connected with the collar on the clutch shaft, the cone moves to the rear, forcing the shoes into contact with A. The drive is, however, taken up without shock, as the shoes have a slight movement on the

Fig. 2.—Component Parts of Michel Clutch.

eccentric portion of the cone. It will be seen that the latter does not form a complete circle, but is broken away at one part to receive the powerful plate spring E, the ends of which are bent outwards to form a spring stop for the shoes in taking up the drive. It is claimed that when engaged there is no end thrust, while only a slight movement of the cone—less than $\frac{1}{4}$ in.—is necessary to entirely disengage the clutch, which operates in a mixture of thick oil and paraffin. Three sizes are being made, suitable for cars up to respectively 10-h.p., 25-h.p. and 50-h.p., the weight of the smallest type being given as 15 lbs.

COLONEL H. C. L. HOLDEN, Dr. W. Watson, Mr. G. H. Baillie, and Mr. Dugald Clerk have been appointed a sub-committee to report to the Technical Committee of the Royal A.C. with regard to a formula for ascertaining the horse-power of internal combustion engines of all types.

THE TAXATION OF MOTOR-CARS.

ELSEWHERE we give our views as to the need of protesting against any further taxation of cars. From the correspondence lately received on the subject we select the following letters as affording a representative opinion on the matter:—

Major C. Leveson-Gower writes:—"No doubt the deputation which approached the Chancellor of the Exchequer and put forward the suggestion of taxation on motor-cars by weight did so after mature consideration, but it appears hardly a fair basis of taxation, considering some people cover 10,000 miles in the year, while others, with the same weight of car, only do 2,000 or 3,000 miles. The mileage of a car can be pretty accurately calculated from the tyre bill, and it only seems fair that motorists should pay according to the mileage they cover in the year. To attain this result, the tax should be on tyres, viz., outer covers only. A rate for each size of tyre and a special rate for studded tyres and bands; solid tyres to pay double rates. Assuming the average mileage covered by the motorist to be 5,000 miles per annum, viz., the life of a set of tyres, and 815 by 105 the size of tyres used, a tax of fifteen shillings per outer cover would not be unreasonable, viz., £3 per annum—an extra five shillings per studded tyre or band; smaller tyres to pay, of course, less and the larger ones more. The tax to be collected from the manufacturer or importer, and each tyre Government stamped. A cheap tax to collect and a fair one to all."

The Rev. A. C. Hervey, M.A., of Colmer Rectory, Alton, Hants, is an enthusiastic motorist, and is "of opinion that any further taxation of motorists or motor-cars would be most unfair. Motor-car owners already pay more than their share in proportion to horse-drawn vehicles. The enormous damage done to the roads by motor-cars is assumed, but not yet proved. The real culprits are the heavy steam tractors which go about the country with agricultural implements, or with a train of trucks each loaded ten or twelve tons. I do not believe that the great body of motorists are in agreement with either the R.A.C. or the Union on this question. Any further taxation of motor-cars should be opposed tooth and nail."

Mr. R. W. Brewer, A.M.I.C.E., who has made a careful study of the fuel question says:—"My opinion upon the question of taxation is that this should be regulated according to the approximate horse-power of the engine, as the damage which the roads are subjected to is due to the wheels revolving at a greater or less rate than is proportional to the speed of the car in many instances—namely, principally when the clutch is let in or the brakes are applied to high power cars. In these cases, particularly with studded tyres, the abrasion which the road is subjected to is due to the horse-power being in excess of what would be proportional to the adhesion weight of the car."

Mr. R. W. Buttemer, M.A., was one of the earliest motorists, being a founder member of the R.A.C., and believes that "the most equitable and desirable tax on motorists is a tax on imported foreign cars, in my opinion (though I use one). Horse-power tax is impracticable, unless merely a heavy tax on cars over X h.p. (each voter placing X one h.p. above h.p. of his own car). Weight tax falls too heavily on owners of old cars, unless date of manufacture could be considered. Any graduated tax based on use of roads should be graduated to all road users, necessitating another Royal Commission to determine damage done by all classes of traffic."

Mr. J. T. Hereford, J.P., the chairman of the Herefordshire A.C., has long studied the motoring problem, and his contribution to our symposium is as follows:—"The taxes on carriages are: Four wheels, two or more horses, £2 2s.; four wheels, one horse, £1 1s.; less than four wheels, 15s. On motor-cars under 1 ton, £2 2s.; over 1 ton, £4 4s. A glance at the taxation (I am only concerned with the ordinary private carriage and car), shows how unjust the present system is. I maintain that 60 per cent. damage is done to roads by hoofs, and only 40 per cent. by wheels. When one also considers that

almost all light cars have plain rubber tyres, the damage they do must be infinitesimal. The whole system of the comparative taxation of motor-cars and carriages shows confusion of thought and prejudice. The only thing that can be urged against cars is the dust nuisance, but that might be largely overcome by improved methods of road construction. The extra taxation we pay compared with carriages goes to the Chancellor of the Exchequer, it ought to go to the improvement of the roads. Any further taxation of cars is ridiculous and unjust."

Mr. G. E. Bentall, of Haybridge, Maldon, says:—"If the Chancellor of the Exchequer desires to tax cars for revenue purposes, the cars taxed should only be those which are luxuries—that is, cars over a certain horse-power. Cars used merely in place of horsed vehicles, whether for professions, business, or for private persons, should not be taxed more than the horsed vehicles they displace."

Mr. E. Montague Edwards, J.P., one of the leading public men of South Essex, who has followed the motor movement from its early days, writes as follows:—"It will be readily admitted that motor traction both for commercial purposes and pleasure is rapidly displacing horse drawn vehicles and is obtaining a firm grip upon public favour. Up-to-date business houses are utilising motor traction not for its novelty but for the acknowledged economies effected. There can be no question as to the extra cost of maintenance of the highways imposed upon local authorities through the wear and tear caused by mechanically-propelled vehicles. This arises from two factors, (a) speed, (b) weight, therefore in endeavouring to reach a basis for taxation these should be amalgamated. Users of trade motor vehicles have demonstrated in several quarters the saving effected as compared with horse-drawn vehicles. Out of this saving they should readily agree to pay part of the cost of road maintenance. A tax to cover this, however, should be reasonable. To make same excessive would at once place an unwarrantable check upon an industry which as developed will add materially to the revenue of the State Exchequer. This will accrue from three distinct sources. (a) The tax upon the vehicles. (b) From the net revenue earned by motor manufacturers. (c) The increased profits of commercial houses using this means of transit. The first (a) should be appropriated in its entirety for road maintenance and reconstruction to resist abnormal wear. The revenue from this source would not be sufficiently interesting to the Chancellor of the Exchequer to warrant his including same in building up his Budget; (b) and (c) would fall into his hands as tax upon earnings from income."

I think a graduated basis of taxation should be instituted, the underlying principle being the actual weight of the vehicle ready for the road, but unladen, plus its nominal horse-power; both to be certified by the maker under a penalty for understating the actual facts of 10 per cent. of the gross list price, recoverable by the Excise department. In instances where a motor has been too long in use, to refer to the manufacturer; the same conditions to be incumbent upon the owner for the time being. Thus for the united units of weight and power vehicles used for transit of goods should be taxed at 1s. per unit per annum. Those used for public service or solely for business purposes by commercial travellers, 2s. per unit per annum, and cars used for pleasure purposes alone, 3s. per unit per annum.

The following examples will, I think, clearly illustrate the above. A motor for delivery of goods weighing 30 cwt., of 20-h.p., would be subject to a tax of 100s. per annum; business cars of 10-h.p. weighing 15 cwt. would pay 50s. per annum; public service cars subject to the same conditions, and for a purely pleasure car weighing 35 cwt. and 25-h.p. would stand to pay £9 per annum. This basic principle might be applied to all mechanically-propelled vehicles, including motor-bicycles.

The mode of distribution of the available funds accruing from the adoption of the above would be a matter for the Chancellor of the Exchequer to arrange, possibly by awarding grants in aid to local councils, regulated by the mileage in each respective area and the use the roads are subject to."

AT the present time there are about 120 licensed motor-cars in use in Shanghai, 75 per cent. of which are reported to be of American manufacture.

MESSRS. J. H. CHALMERS AND SON have a repair shop in Bridge Street, Kelso, and during the coming season will let cars on hire.

MR. W. S. CORT, of Church Street, Market Harborough, will make his first appearance as the agent for the Beresford rim at the Cordingley Motor Show, which opens on Saturday next, the 21st inst.

It is currently reported that measured distances are becoming more frequent in the Royal parks, where the constables are assiduously watching for those motorists who exceed the ten mile speed limit.

"VULCANISATOR" is an addition to the motorist's vocabulary, suggested by Messrs. Harvey Frost and Co., this being intended to designate an efficient operator of the well-known vulcaniser introduced by the firm.

CASTLEBAR, co. Mayo, has now an up-to-date garage, thanks to the enterprise of Messrs. J. Bourke and Sons. They also keep a large stock of motor accessories, and are in a position to assist motorists who may be in difficulties when in that part of Ireland.

THE London and North-Western Railway are running several excursions in connection with the forthcoming Motor-Car Show at the Agricultural Hall, and special cheap bookings are announced from Warwick, Coventry, Dudley, Wolverhampton, Walsall, and Birmingham.

A NEW Italian-built car is being introduced into this country by the Union Motor Car Company, 21, Denbigh Street, Victoria, S.W., who will exhibit it at the Cordingley Show. The vehicle, which is known as the S.M.B. (Societa Meccanica Bresciana) is fitted with a 20-h.p. four-cylinder engine.

A MOTOR-CAR race was held in the Argentine Republic on Saturday last over 248 kilometres (155 miles). The winner in the racing category was Dr. C. Lamarca, who, on a 14-h.p. De Dietrich, covered the distance in 3 h. 35 min. M. Vaupelins, on a 40-h.p. Berliet, secured the first place in the touring car class in 3 h. 38 min.

AT the Newhaven Rural District Council meeting, complaint has been made of the fact that many motorists took out their licences in London and then used their cars on the country roads. Why not? The streets of the Metropolis would be crowded if all the automobiles registered at Spring Gardens were never to go beyond the old four mile radius.

OWING to the increase of trade, Mr. D. Sweetzer has transformed his business into a limited liability company. All kinds of repairs are a speciality, and they are making a point of improving old cars, as well as keeping new ones in running order. The title of the new company is the Reigate Garage, Limited, and it is intended to greatly increase the premises at an early date. Mr. D. Sweetzer is the managing director.

MR. R. S. TILLING, speaking as president of the Job-masters' Protection Association at the annual dinner on Tuesday, said the motor-car is not going to do away with the horse. As a matter of fact, the introduction of motor-cars is likely to do the horse trade some good, "for," he went on to observe, "the weary motorist, after sitting for days inactive in his machine, must have exercise for his liver's sake, and there is nothing so good for the inside of a man as the outside of a horse."

A SPLENDID addition to the motor showrooms of the West End of London is that of Messrs. W. and F. Thorn and Co., which has just been opened at Great Portland Street, W. The old premises were burnt out about a year ago, and on the site the firm have erected a showroom for their motor bodies which will rank among the architectural adornments of London. The building is well lighted and decorated with real artistic feeling, and on a floor area of 7,000 square feet Messrs. Thorn will have ample opportunity for displaying the high-class productions of their motor body works in other parts of the metropolis.

THE Leaborne Manufacturing Company, of Pinner Road, Harrow, are charging accumulators for local motorists on very reasonable terms.

TENDERS for the motor-tricycle required by the Beckenham

District Council for Fire Brigade purposes should reach the Clerk by the 23rd inst.

IN the north of Scotland motor traders are hopeful as to the prospects of the coming season. Messrs. Junner Bros., of Elgin, have commenced spring business by supplying a 12-16-h.p. Argyll to a local doctor.

MESSRS. JOHN CROALL AND SONS, LTD., Edinburgh, propose placing four motor taxi-cabs on the streets of Edinburgh during the present month. They are four-cylinder cars of the landaulet type. The magistrates of the city have not yet fixed the fares to be charged, but have the question under their consideration.

THE new works of the Humber Company at Coventry, which cover an area of thirteen and a half acres, and give employment to 5,000 hands, are now completed, and on Thursday were thrown open to the inspection of a large number of visitors. We give elsewhere a view of one of the many departments of this most complete establishment.

The above illustration depicts the patent chain case which the South Wales Motor Company, of Cardiff, have lately designed for 1907 Daimler Cars.

The cases are dust-proof and oil-tight, and when fitted not only is the noise of the chains eliminated, but their life is greatly increased.

THE large and roomy garage situate at Belgrave Gate, Leicester, under the supervision of Mr. G. H. Wait, of the firm of G. H. Wait and Co., is one of the best arranged in the Midlands. The repair department is equipped with up-to-date machinery, and there is storage room for fully 50 or 60 cars.

AN illustration of the power of the motor-car was given the other day, when Mr. W. Raikes-Bell drove a 20-25-h.p. Werbell car to the top of the Law Hill, so well known to residents of Dundee. Mr. Bell made a flying rush up the path, and the car was soon on the top. The car was, after an interval, driven down again by Mr. Bell, with him being Mr. E. R. Bell. The performance was all the more meritorious from the fact that the ground was soft and wet with the morning's rain. The back tyres were fitted with Parsons non-skid chains.

DURING his recent visit to America Mr. G. H. Smith secured for the United Motor Industries, Ltd., the British agency for the K-00 lubricant for change-speed gears. It is largely used in America by automobilists, the great point being that it always travels with the teeth. It does not matter at what speed the gears are running, this always happens, and there is a film of lubricant perpetually between the teeth at the moment of their contact and during contact. This lubricant retains the same consistency, and is not affected by temperature.

AMONGST the recent purchasers of Fiat cars in India is Mr. Dwarkadas Dhuramséy, the new Sheriff of Bombay.

DR. HELE-SHAW on Thursday commenced a series of three lectures on the Navigation of the Air, before the Society of Arts.

THE attention of intending competitors for the Daimler Engineering Scholarships is called to the fact that all entries must be received on or before the 31st inst.

THE Daimler Company have received orders from the Countess Dysart for a 36-h.p. "Stoneleigh" limousine; the Right Hon. Earl of Ellesmere for a 30-h.p. "Blackdown" landaulet; and Sir Robert Hermon Hodge, Bart., for a 30-h.p. "Birdlip" limousine.

WE illustrate herewith an improved semi-flash generator for steam cars and lorries, which has lately been introduced by Messrs. Bolsover Brothers, Ltd., Eaglescliffe, Durham. The generator consists of a 5 in. diameter vertical drum, which acts as a separator, and is surrounded by eight spiral coils inclined at an angle to the vertical. As the generator is welded throughout by means of the oxy-acetylene blow-pipe, it can be made red-hot without the least damage ensuing. It is claimed to combine all the strong points of the flash with those of the water level boiler,

while an idea of the rapidity of the steaming can be gleaned from the fact that a full head of steam can be raised from lighting the burner in 2 min. 15 sec. The makers inform us that the boilers, which are submitted to a cold water test of 1,200 lbs. before being sent out, are adaptable for fitting in Stanley or White steamers, when renewals are required, and that should the generator become dry through shortness of water no damage will result. The car merely stops until more water is supplied to the boiler.

At the annual meeting of the Cardiff Pilotage Board a petition signed by fifty-seven pilots against the introduction of auxiliary motors on two pilot boats was presented. It is reported that two local pilots are adopting motor-boats.

Of the thirty-five cars entered for the Trials of the Motor Union of Western India, twenty-eight started, no less than twenty-one being fitted with Dunlop tyres. These twenty-one cars got through the four days' running with only two pauses on account of tyre troubles—one "nip" and one bullock-shoe puncture. Five out of six of the first prizes awarded were won by Dunlop-tyred cars.

THE Egyptian Automobile Club will next month hold a motor-car race over a sixteen-mile circuit near Cairo.

MESSRS. GURNEY AND EWER, of the High Street, Pinner, have works at Ruislip for the repair of motor-cars, &c.

MESSRS. AFFLECK AND BROWN, drapers, Manchester, are now using a Belsize 20-h.p. petrol motor delivery van in connection with their business.

THE imports of motor-cars and parts into South Africa through the ports of Cape Colony and Natal amounted last year to a value of £115,251, as compared with £105,724 in 1906.

THE authorities of the Royal Naval Barracks, Portsmouth, have lately acquired a steam motor-wagon for conveying blue-jackets' luggage and stores from the barracks to the Dockyard.

MESSRS. WALKER BROS., of Pagefield Ironworks, Wigan, have lately supplied a petrol motor tower wagon to the Wigan Corporation for use in connection with the electric tramways in the town.

A GUIDE to Mersea Island, with a full account of the historical region roundabout, has been published by Messrs. Benham and Co., of Colchester. It should prove of considerable interest to motorists enjoying trips in that district.

IN connection with the coach-building business of Messrs. Stevenson and Sons, The Parade, Leamington, a motor garage is established with accommodation for about a dozen cars. The location of the premises is admirable for the convenience of visitors, while the facilities provided are all that motorists can desire.

AN interesting collection of books, newspaper cuttings, pamphlets, &c., relating to balloons, aeroplanes, and aeronautics, has just been placed in the new Library of the Victoria and Albert Museum at South Kensington. This will be of interest to all who are concerned with the Aero Section of the Motor Show at the Agricultural Hall, London.

A NEW automobile road from Mexico City to Cuernavaca, Mexico, was recently inaugurated, seven cars joining in the procession. The new road is considered one of the most picturesque to be found anywhere in the country. While many of the grades are very steep, the sands near Tlalpam are considered to be the part of the road which taxes the machines the most.

THE Crown Agents for the Colonies are sending to Nigeria two Siddeley cars, built by the Wolseley Tool and Motor Car Company, Ltd. One is a four-seated phaeton, fitted with Cape cart hood, and is intended for the personal use of the Governor, Sir Percy Girouard, R.E., K.C.M.G., D.S.O. The left-hand front seat is removable, so that the space can be occupied for sleeping or fitted with a stretcher for the purpose of carrying an invalid. The second car is to be used as a luggage cart, and for the attendant natives. Both cars are equipped with 18-h.p. four-cylinder engines, Elastex filled tyres, and are painted dark green. The upholstery is in khaki colour leather with removable canvas covers for protective purposes.

THE City Council of Newcastle-on-Tyne adopted a report of the Watch Committee recommending the making of new bye-laws in lieu of the then existing bye-laws as to lights on vehicles, which were repealed as from January 1st, 1908, by the Lights on Vehicles Act, 1907. The new bye-law provides that every person who shall cause or permit any vehicle to be in any street, highway, or road to which the public have access during the period between one hour after sunset and one hour before sunrise, shall provide such vehicle—(1) With a lamp or lamps in proper working order, and so constructed and capable of being so attached as when lighted to display to the rear a red light visible for a reasonable distance; and (2) in addition to the lamp on the off or right side of the vehicle, as required by section 1 (1) of the Lights on Vehicles Act, 1907, with a lamp in proper working order, and so constructed and capable of being so attached on the near or left side thereof, as when lighted to display to the front a white light visible for a reasonable distance; and if the lamp is so constructed as to permit a light to be seen from the rear, that light shall be red. Provided that paragraph (2) of this bye-law shall not apply to heavy and slow-moving vehicles.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We beg to thank "I. E." for at last admitting there is something in our timers, viz., synchronization. That is what we have been trying to impress upon him and others. As regards position, as we have said before, if any one has a pet theory of his own, he can have our timers set to it, then he can get his position with accuracy, and obtain what he otherwise could not—absolute accuracy. He says he has set his valves by marking out the flywheel with a protractor. We should be glad if he will give us the position he has set them. Then we will send one of our instruments set to his position, and we are still open to offer him that £100 if he has got them absolutely synchronized.

We still maintain that our position is correct for all engines, and wish someone would take up our challenge to prove it. As regards the Clement car with the two-cylinder Aster engine, which was referred to in our last letter, this is now ready and has been tested on the hill mentioned, and did exactly what we claimed it would. It went up the hill on its second speed, taking the last 177 yards in 21 sec., which is over seventeen miles per hour, somewhat different to going over on its first speed, as it did till we altered the timing to our setting. The trial was witnessed by an independent engineer. On the track its fastest speed was 33 miles per hour.

We notice that "I. E." has come to the conclusion that to get the Larrad period will require a good deal of work on some engines. • Ye*,

later. Of course this cannot be done on every car, as there is not sufficient clearance between the tappet and valve, but there was ample in this case. "Yorks" asks which position gives the best pulling effect. In my opinion, and with due deference to the Larrad Syndicate, who will assure me I am mistaken, it depends upon the engine and the exhaust valve. If the exhaust valve is undersized, as a good many are, a long exhaust—say 50 per cent. from centre and 7 degrees over, give very good results. Some years ago I made experiments with different exhaust settings and only found advantage from a very long exhaust where the exhaust valves were very small. I quite agree with "Yorks" that the matter is of absorbing interest, and I am anxiously waiting to see the particulars of other manufacturers. —Yours truly,
INTERESTED ENQUIRER.

THE ACTION OF SPRINGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of the 22nd ult. there appears a letter from Mr. J. E. Bishop, of Melbourne, who writes respecting a letter from myself which appeared in your issue of October 12th, 1907. Mr. Bishop puts two questions to me:—1, as to what I mean by the phrase "rapidity of action." 2, My authority for the figures given.

I will deal with the second question first, as it can be most quickly disposed of. The figures I give in my letter of eighty-six times per

The Fleet of Motor Vehicles used by the Fire Brigade at Springfield, Mass., U.S.A.

but the results will repay for the time and trouble taken. As regards engines with automatic inlets, we use the same setting for the exhaust, but naturally we cannot get the good results out of them as we do of the others; at the same time we should like "I.E." to see and hear how an old four-cylinder Star and an old four-cylinder Panhard, which have just been timed to setting, can run when timed to our setting. Their respective owners, Dr. Murdoch, Bexhill, and Mr. Garlich, St. Leonards, will tell him that these cars have never run so quietly, or developed the power that they do now, and on these, of course, it is only possible to get half the good results which can be obtained on engines fitted with mechanically-operated valves. As regards "I.E.'s" experience, this is nothing to go by, because often an invention is created by one who knows very little about the particular trade in which it will be used. Take, for instance, the inventor of this timer; Mr. Larrad, although a trained engineer, has had very little to do with internal combustion engines till he joined us, but he soon realized that something was wanted to synchronize the valves, and that only one position was correct, and subsequent events have proved that he was right, and to prove it we issued the challenge.—Yours truly,

LARRAD'S PATENT SYNDICATE.
H. Pulham.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the letter in your issue of the 7th inst., I am very sorry that your correspondent considers it unjust for me to express an opinion.

With regard to the exhaust valve query raised by "Yorks," I am indeed sorry I did not make the Brussels incident clearer. The mechanic did extend the exhaust stroke by the very simple expedient of lengthening the exhaust valve, which would naturally cause it to open earlier and shut

minute for the best spring steel and ninety times per minute for rubber were stated to be approximate. The actual figures for these should read:—Spring steel ninety times per minute, and rubber ninety-five times per minute, but the slight discrepancy between the approximate figures which I gave and the actual figures would make no actual difference in the calculation for absorption of shock for which I suggested their use. My authority for the figures ninety times per minute for steel and ninety-five times per minute for rubber and 1,800 times per minute for air, is the late Lord Kelvin, who supplied these figures to a friend of mine interested in scientific data. For confirmation of them I can refer Mr. Bishop to Mr. E. B. Killen—one of my directors—who has had several experiments made in confirmation of same, with the exception that in these later experiments the figures for air show a slightly lower periodicity, being between 1,600 and 1,800 times per minute.

With respect to Mr. Bishop's first question, it is somewhat difficult to explain, except in technical terms, the meaning of the phrase "rapidity of action." I should define it as being the natural ability of the atoms composing a substance to "come and go" without premature exhaustion of such material and without undue absorption of power. It is solely from lack of knowledge of these figures or inability to grasp their true meaning, that so much time has been wasted over the impossible feat of producing a spring wheel or solid rubber tyre which will absorb shock at a speed of over eighteen miles an hour. Unless such wheel be made of gigantic proportions, it is physically impossible for it to absorb road shocks at high speeds. It is, of course, hardly necessary to state that vibration is only an extremely rapid recurrence of shock. Crystallization of steel (even in the form of laminated springs), under vibration is one of the results which immediately follow its lack of ability to absorb such vibration owing to its low rapidity of action. In rubber, also, excessive vibration and shock induces premature hardening and subsequently internal disintegration, because its rapidity of action is

not sufficiently high to absorb such vibration. Given the data enunciated above, it is an easy matter to see that nothing but a combination of some resilient material backed by confined air can ever possibly give resiliency. A car travelling, say, sixty miles an hour covers 5,280 ft. per minute. Supposing the car to be shod with 32 in. tyres, the tyre will approximately have 8 ft. circumference. (N.B.—In travelling the diameter becomes shortened one inch owing to the tyre flattening half-inch at the point of surface contact with the road, due to the weight of the car). Thus it will easily be seen that if the length of the circumference be divided into the distance travelled in a minute, i.e., 8)5 280, a tyre of this size will have to absorb 660 shocks or depressions 660

when travelling at sixty miles per hour. From the figures given above it will at once be seen that the air proportion must be a little greater than $\frac{1}{3}$ air to $\frac{2}{3}$ of rubber to attain this speed without forcing the action of the rubber or air beyond its natural rapidity of action.

It must be noted that if rubber encloses and confines some substance with a higher rapidity of action, such as air, its rapidity of action will be increased as above. At the same time, I do not deny that a solid rubber tyre or spring wheel may be run at a greater speed than, say, eighteen miles an hour, but above such speed shock is not being absorbed and power is being wasted in attempting to force the rubber or steel above its natural rapidity of action.

If Mr. Bishop will let me have his private address, I will go into this matter with him at a much greater length than I could possibly do in the columns of your paper, which are too valuable to be devoted to a subject which—however interesting it may be to those of a scientific mind—is purely academic so far as the majority of your readers are concerned.—Yours truly,

THE "K.T." SYNDICATE, LTD.
A. Ernest Gelder (Manager).

The 60-h p. Six-Cylinder Napier Touring Carriage recently delivered to Sir William Avery, Bart., of Oakley Court, Windsor.

Sir William, who is a practical motorist, has suggested many special features which have been embodied in the car, as, for instance, Bramah locks on all accessible cupboards, extra folding steps, luggage grid at the rear of the car, umbrella basket, extra high hood, and special folding additional seats to the interior—all of which make for comfort and convenience.

THE ENDORSEMENT OF LICENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The other evening I had the misfortune to be stopped by a P.C. with the greeting "light out"; it was a boisterous night, and a lamp that had never failed me for over a twelvemonth played me false. To make matters worse, I had left my licence at home.

Accordingly I received two summonses. For the first offence I was let off with payment of costs, for the second fined one shilling and costs. For this serious (!) offence I have had my licence endorsed.

What I want to know is, is this right according to the Act; this is my first offence. Can they endorse a licence for so trivial a matter?

Thanking you in anticipation for your reply to my enquiry.—Yours truly,

A. D. K.

[Yes, the endorsement is strictly within the letter of the law; we do not suggest it is in accordance with common sense.]

THE AUTO TYRE INFLATOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice illustrated on page 1,127 of your issue of the 22nd ult. a very interesting little tyre inflator. This problem seems to have evoked a considerable amount of interest of late, and we have had illustrated in the technical Press several designs, some of them of extreme interest and ingenuity.

At the first glance the Maxfield inflator appears to possess a considerable number of advantages, but on looking closely into it, and

scaling off the diameter of the friction wheel, assuming that it is driven from a flywheel of an ordinary car at the ordinary speed the engine runs, it appears to me that this inflator will have to rotate at 3,000 revolutions per minute. This speed seems excessive, and my experience of ball valves tends to show that these valves would not close in the time available, and consequently the efficiency of the pump would drop to such a low point that it would be of no practical service.

I should be glad to know if a pump has been constructed, tested and found satisfactory, made in accordance with these drawings, and I should also be glad to know how the air is admitted to the cylinder and what the delivery valve V is connected to. The delivery valve V1 is, of course, obviously for connecting to the tyre, but I cannot see any connection for the delivery valve V.—Yours truly,

PHILISTINE.

TYRE SIZES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are fully in accord with the opinion expressed by Mr S. F. Edge during the discussion upon Mr. Mervyn O'Gorman's paper on "A Number of Things: Their Effect on Tyres," read before the members of the Royal Automobile Club recently, to the effect that "The time is not far distant when tyres with a cross section of 8 in. or 9 in. will be quite a commercial proposition."

We have realised this for some time, and in view of the remarkable results obtained with 6 in. Palmer cord tyres, we about six months ago put in hand a pair of automatic cord laying machines, capable of producing Palmer cord tyres about $7\frac{1}{2}$ in. or 9 in. in cross section. The machines are now approaching completion, but it will probably be next year before tyres of this size are ready for the market.

We think it advisable that the designers of new cars should allow clearance for much larger tyres than formerly, as it is certain that, owing to their greater economy and increased comfort, much larger tyres will be used in the future.—Yours truly,

THE PALMER TYRE, LTD.

STEAM CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Amateur's" letter in a recent issue, I would like to advise him that there is no occasion for him to be "nervous to venture," as he phrases it. There is no car to come up to a good steam car. I myself drive both petrol and steam cars daily, and I much prefer the steamers. For traffic work they take first place easily, and I have often noticed that while another man is coaxing his engine, slipping his clutch or changing speed behind other vehicles, I with my steamer have just to open the throttle a little, and I shoot by him and the other traffic out of sight before he can get under weigh. The steam car I am alluding to is the White; a 10-h.p. car of this make is, I feel sure, as good as any 20-h.p. petrol car, and the latest 10-h.p. White must be about three years old. I have had several of them, 10-h.p. and 15-h.p., and in fact during the last four years I have never been without one. The absence of the gears and consequent gear vibration and the immunity from electric troubles is greatly in the favour of steam cars, while the enormous exertion required at the starting handles, with its attendant risks, is dispensed with. In most steam cars, any way as far as driving is concerned, the car and the engine are a unit, that is to say that when the car moves the engine must also move. In some of the steam cars the engine has been adapted to run free for the purpose of pumping water and air, but the car is not driven with a clutch like a petrol car, and when a steam car stops, engine and all stops, and there is nothing to worry about, no winding up when you want to move on again.

Now, imagine a petrol car, a three or four year old one, in a busy thoroughfare, with carts in front, and say 'buses behind, all stationary for a few minutes. The driver of the petrol car must keep his engine quiet; he retards ignition, perhaps. His engine begins to "sweat," steam hisses out of his radiator, he is a bit worried; when he stopped he was probably on top speed, waiting his opportunity with his clutch depressed, now he endeavours to move. One, two, his engine has stopped; he hears some gibes, he jumps out to start up again. One, two, stop, bang, he is nearly run over by his car, having left his gear in. A mad rush for the lever, a cab has drawn close up to the off-side. Another mad rush to the other side and in the car, puts the lever to neutral; once more to the handle, and the engine starts (perhaps). Up he jumps again while the cabbie whistles "Home, Sweet Home," first speed now, carefully, two or three pops and the engine stops again. Alas! he has left the brake on. A carter shouts, "Borrer my nose bag, guv'nor." Once more he tries, and this time succeeds, accompanied by the recherche language and merry tunes of the 'bus-drivers. Behind there is the lucky man with the steam car; he shut off his steam some minutes ago, nothing worries him, and when the traffic moves he opens his throttle and glides on. Steam cars, none of them, are, however, so simple that a child could look after them; a man needs to be a bit of an engineer. The man in the street knows something of the petrol car, but nothing of the steamer, although he will ask you, "Ar'n't you frightened of the boiler bursting?" Even then he only shares the opinion of hundreds of others. It is almost impossible to burst these generators; they being, in most steamers, a series of coils of steel piping about $\frac{1}{4}$ in. bore, there is no

danger even if this did burst, being in comparison like opening a valve and letting the steam go.

I very rarely have an involuntary stop on any steam car, and they are so kind to tyres that these do not give half the trouble as experienced in a petrol car, while the great charm is the way they go up hills; if anything they go better than on the level; one could almost imagine the car being hauled up by an invisible cable, so silent and athletic is the power given to the wheels behind you. The generators rarely give any trouble, and dirty water has no effect on them. There is no smoke and no smell after starting. I think the White, Stanley, and Turner-Miesse are among the most easily manipulated steam cars on the market.

I do not want to say that there are no petrol cars to be compared with steamers, but I assert that if half the money and a quarter of the brains spent on petrol cars were devoted to steamers, we would have some very speedy and reliable vehicles on the road. A rooted prejudice still exists in the minds of the car buying public that steamers are dangerous and unreliable. I shall always maintain, and am willing to prove, that the maximum power and speed, the minimum weight and complication, the least destructive effect on machinery and tyres, is attained in the steamer. The public are kept conversant with the accomplishments and improvements of the petrol car, but they are ignorant and unable to form any valuable opinion while they adopt a hostile and non-sporting attitude with regard to the steamer. It is positively a revelation to the "petrolman" when he has his first ride in the steamer, and I am sure he will testify to the luxurious and buoyant riding, such as is only experienced in a petrol car costing about twice the price of the steamer.

The public need have no fear about them, and there are plenty of them. There is no comparison between them and the petrol cars of double their power, considering the way they work and the way they do it, without chattering or grumbling. Steam cars are becoming now almost entirely automatic; in fact, I believe "they will soon drive themselves," and a thorough knowledge of these automatic parts and their particular functions is all that is required for one to be quite *au fait* with the steam car.

Some more correspondence and mechanical analysis, as I said in my previous letter, published of steam cars now and then, accounts of their construction, accomplishments, and failings, if any, would tend to familiarise people and show the great possibilities of steam as the motive power for road vehicles. Many admit their superiority in hill-climbing, but maintain that the cars cannot stand the pace, that they are soon worn out, and are a great deal of trouble. Do not believe it. As I have said elsewhere, I am willing to prove all I say in regard to my favourites, the steam cars.—Yours truly,

HERBERT J. CHAPMAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to your enquirer "Amateur" I have been driving Turner-Miesse cars for the past five or six years. I bought the first one second-hand, and, after driving it four or five years, handed it to the makers in exchange for one of their later models, as I wanted one of somewhat later type. My repairs for the fifth year, bar tyres, amounted to £1 11s. They are quiet running and very powerful. The flexibility of steam is one of the great features in its favour; so great is it that you can run at any pace you like from a crawl up to thirty miles per hour.

I took over the car after only one day's tuition, and I think the best proof of my opinion after five years' use is the fact that I purchased another one. If I were a rich man I should have all sorts and powers, but the bulk of them would be Turner-Miesse cars. I can confidently recommend "Amateur" to purchase. I should strongly advise him to communicate with the manufacturers, who generally have one or two second-hand cars which they have taken in part exchange for new ones, which I believe they offer thoroughly overhauled and subject to the same guarantee as new cars.

I have no connection whatever with the firm except as a satisfied owner. I may say I have always found the company extremely prompt and courteous in all their dealings, and I shall be glad to answer any questions if your correspondent cares to write to me direct.—Yours truly,

E. H. O. SANKEY, M.A., M.B., B.C.

TO THE EDITOR OF *The Motor-Car Journal*

SIR,—I fully concur in the remarks of your correspondent "Steam" as to the flexibility, ease of control, silent running, hill climbing powers, and absence of complications in a properly managed steam car. I have owned and used one of these handy little cars for more than five years, and have driven same over 10,000 miles, without having been once held up or failing to get home.

The prejudice that has existed so long against steam cars is due more to ignorance and mismanagement than anything else. I use my car constantly and can run 90 miles on one fill of petrol, and with the spare engine and boiler, and other parts that I have of a similar car, expect to go on for several years yet, and to outlast many petrol cars.—Yours truly,

LOCOMOBILE.

ARE TWO IGNITIONS NECESSARY?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the numerous letters now appearing in your journal on the advisability of fitting two ignition systems, I should be glad to testify to the extreme satisfaction which the Simms high tension magneto which I have fitted to a 30-h.p. Rhodes car has given me, it being my only form of ignition. I have never experienced misfiring of any kind, or had occasion to look at the plugs, even, and the engine always starts at the first or second pull over, although I am running on benzole, and using the car in all sorts of weather.

I may say that I have absolutely no interest in the Simms Company, but should like to record my appreciation of their magneto, which has proved perfectly satisfactory and reliable in practice. One little incident is perhaps worth recording. On a recent occasion, through an oversight on my part, one of the water connections was left loose, with the result that after the car had been running for a short time it converted the interior of the bonnet into a sort of amateur shower bath, but, contrary to my expectations, the engine continued to pull as well as ever, which I think speaks volumes for the way in which the magneto is constructed and its more vital parts protected from damp.—Yours truly,

L. T. BISHOP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Chauffeur” is evidently pleased with himself that he has both systems of ignition fitted to his car. As to seeing several cars towed home that are fitted with the low tension magneto, well, that ought not to be if the men understand their work. When the tappet gets deranged on the low tension, and the firing is all wrong, it requires

Herr Salmon on the 28-40-h.p. Fiat Car on which he won the recent Gothenburg-Stockholm Race.

experience to set them right again, and I well remember in the early days of the magneto the “timing” was considered a trade secret. I have never once taken a magneto off its bed to correct firing, and yet, with my knowledge of magnetos, I find it impossible to get a berth. If those benighted chauffeurs were to get a practical and sociable mate in their district he could assist them out of their difficulties.—Yours truly,

LOW TENSION.

ELECTRIC LAMPS FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the query by Mr. J. A. Stephenson in the *M.C.J.*, March 7th, 1908, the method I have been using, and which I consider the most efficient and simplest, is as follows:—

Put a 4-volt Osram lamp in the rear lantern and a 2-volt Osram lamp on the dashboard and connect them up in series, and it will be found that the 4-volt rear lamp is very nearly as brilliant as it would be were it alone in the circuit, and the 2-volt lamp filament is a bright yellowish red, which is exactly what one requires. The advantages are obvious: (1) only one 4-volt battery is required; (2) the current consumption is rather lessened than increased.

The lamp on the dashboard is placed in front of the board and shows its light through a small (half-inch) disc of red glass placed over a hole in the dashboard.

The current consumption of the two lamps in series is 7 amperes. So that the 30 amp. accumulator would give rather over forty hours' light.

If Mr. Stephenson would call upon me I should be pleased to show him my arrangement.—Yours truly,

G. WASHINGTON ISAAC.

THE CARBURETTOR AND ITS FUNCTIONS.*

THE carburettor is the lungs of the engine, and large power, long service and efficient action depend upon this device. Many varieties have been offered, and the road to the patent office is busier to-day than ever with people who think they have carburettors superior to former designs. With a fixed gas no carburettor is necessary, but air and gas adjustably proportioned are permitted to mix on their way to the cylinder with good results. The earlier inventors generally attempted to provide the gas by drawing air in some manner through a tank containing petrol, which permitted the air to absorb petrol vapour and issue from the tank practically saturated with vapour. This over-rich mixture was then diluted by the admission of air to form the proper mixture. In one form wicks of cotton served to distribute the vapour through the air. In another form the air was drawn down into the liquid and, bubbling up through it, became saturated. Other inventors seeking simplicity admitted the petrol directly into the air passage, trusting that it would be sprayed or vaporised and mixed with the air before the end of the compression stroke. Still others provided a spray nozzle, past which the air is drawn with sufficient velocity to break the liquid into a spray. This form is now in almost general use to the exclusion of other types. Each is usually called a carburettor, but the present form is more appropriately an atomiser, or, since its essential service is to mix liquid fuel and air to form what is universally called a "mixture," I prefer the short, simple, expressive word, "mixer."

PETROL MOTORS.

A number of facts concerning petrol engines must be kept in mind when considering the mixing device if the engine is to give superior results. First, the mixer must perform its function to the fullest possible extent, and intimately mix the air and liquid. It is not enough that it should provide a proper mixture at high speed only, for, although this will cause the engine to show a high power, it will not give smooth running or great power at slow speeds. If the mixture is not intimately mixed, some parts are too poor to burn, others burn slowly because lean, while other parts are too fat to burn, or burn very slowly because over-fat. The result is little power, a hot engine, much deposit of soot, and an ill-smelling exhaust that is distinguishable at a distance.

Second, in order to have full power and give the best results the liquid fuel must be properly proportioned to the air. Too much or too little liquid produces slow-burning mixtures and undesirable results. Further, although during each cycle the engine may receive the proper amount of air and liquid for the perfect mixture, if the early portion is air and the latter portion largely liquid, it is quite evident that a homogeneous mixture will not be produced, and that proper ignition with perfect engine behaviour cannot follow. It is therefore necessary that the air and liquid be proportioned constantly in a proper manner, and this may be rightly termed the second great requirement.

Third, it is also evident that different sized engines will have different requirements, and that a mixing device suited to one may not be suitable when fitted to another. The same is true in connection with speed. A proper mixture at one speed may be completely thrown out of proportion, or may be improperly mixed at another speed. Engines nowadays run at rotative speeds from 20 to 2,000 r.p.m., and the perfect mixer must meet these requirements. Since at high speeds full charges are usually used, while at the low speeds the throttle reduces the charge admitted, it is quite evident that the service required of a mixing device is not adequately represented by the proportion of ten to one, but that it is probably more nearly twenty to one, and possibly may vary as much as fifty to one. Such wide variation increases the difficulty of maintaining proper proportions and making a perfect mixture, and renders it necessary that the mixer should automatically adjust itself to the varying requirements.

FAULTY CARBURETTOR CONSTRUCTION.

These three features are the basic ones which must be kept in mind while considering the minor but important points of the perfect mixer. Most mixing devices heretofore constructed have aimed to provide for these three points, but more often than not each provision has been an imperfect one, and the results not of superior quality. The typical mixer of to-day takes air from the atmosphere at practically constant pressure, and liquid from a float chamber presumably having a constant level. Since, however, the quantity of air required is about fifteen hundred times greater in volume than of the liquid, and since the speed under a given suction is much greater than the speed of the liquid, it will be seen that wide opportunity for improper proportion exists. Add to this the facts that at very slow speeds the liquid may not be sprayed, but may be simply drawn from its nozzle in large drops, or even in a stream running down the outer walls of the nozzle, while at very high speeds the air inlet may be too small to admit a sufficient quantity of air, and the difficulty of maintaining a proper proportion under such wide variation will become apparent. To meet this difficulty the perfect mixer must automatically enlarge the supply of air and vary the liquid to maintain it proportionate to the air as

the needs of the engine grow greater. To do this with certainty it should have a diaphragm acted upon by the suction of the engine, which diaphragm should be large enough to respond to slight variations, and thus prevent high vacuums, with consequent reduced power at high speeds.

This method of providing for wide range is the only correct method. The mere opening of the usual auxiliary air port cannot perform this service, for the suction must increase considerably before the air port will open, and there is seldom or never provision made for securing either intimate mixture or proper admission of proportionate amounts of air and liquid with this auxiliary device.

This necessary automatic adjustment should not only be operated by the suction, but it should be sensitive enough to prevent much variation in vacuum between high and low speeds, and the mixer at high speeds should have openings large enough to admit the fullest possible charges, while at low speeds the opening should be so small as to secure sufficient air velocity to make a perfect mixture, that is, a fine spray of the liquid properly proportioned and intimately mixed, even when turning the engine over by hand. This can only be attained by permitting a large diaphragm to vary the size of the passage or passages under increased suction, and consequently proportionate to the speed.

BALANCE OF THE FLOAT.

The float chamber should be concentric with the liquid inlet, so that inclination in any direction will not cause more or less liquid to be admitted. The float should be surrounded by a substantially concentric volume of liquid that will support and balance the float, with the result that sudden vertical movements, such as jolts, are without effect. This arrangement is superior to floats balanced by weights, in addition to the column of liquid, for, owing to their different densities, the liquid and the weight may interfere in their duties and destroy the perfect balance sought for. The float should be a single piece, preferably without working joints, and particularly without frictional contacts with levers, which may sooner or later wear through its thin metal and cause it to leak. The float should be constant in weight and buoyancy, and is therefore preferably of metal. The float point should be adjustable, so that the level of the liquid may be maintained at the most advantageous point to suit the vacuum necessary to make the proper spray, and also to overcome the effect of different heads of petrol which may be used. The float point may be of such taper and size as to in some degree vary the petrol level in action, giving a higher level and better mixture at slow speeds.

(To be concluded.)

WATER FOR MOTOR-CARS.

A SCALE of charges for water supplied for washing motor-cars was decided upon by the Metropolitan Water Board last week. In future 20s. per annum must be paid for each private car, and there is no fixed scale for trade motor vehicles. The Appeal and Assessment Committee proposed the following scale of charges:—Horses, private, 6s. each; horses, trade, 4s.; carriages, private, two wheels 5s., four wheels, 10s.; carriages, trade, two wheels, 2s. 6d. each, four wheels, 5s. each; motors, private, 10s., trade, dependent upon horse power, &c. The Finance Committee, however, arrived at the conclusion that these proposals would involve the Board in a loss of income of £17,000 per annum, and Lord Welby, on their behalf, moved that the charges be increased to 8s. each for private horses, 6s. each for trade horses, and 20s. each for private motors.

Lord Welby gave particulars of the charges made for washing purposes by the water companies, and said the scale proposed by the Assessment Committee would result in a serious loss of income. Motor-cars required considerably more water for cleaning purposes than horse carriages.

Mr. Dove objected to a distinction being made between horse vehicles and power driven vehicles. He thought all carriages ought to be charged alike.

Mr. Norris described the proposal to charge more for motor-cars as class taxation. Motor-cars were already sufficiently heavily taxed by Parliament. It had been suggested that a motor-car consumed a certain amount of water in the radiator. As a matter of fact the loss by steam was less than half a pint in 400 or 500 miles.

Col. Collins: A great deal more water is used for cleaning a motor-car than a carriage.

Mr. H. Karlake: Infinitely less water is used for a motor. He described the scale of charges as an attempt to tax motor-cars for the benefit of the water consumer.

Lord Welby's amendment was, however, adopted as the future policy of the Board.

THE Bombay Motor Car Company have received a letter from Professor Dawson, Principal of the Victoria Jubilee Technical Institute, and Joint Honorary Secretary of the Motor Union of Western India, eulogising the performance of the 28-h.p. Daimler car which he drove in connection with the recent Indian motor trials. As the car was only received a few hours before the commencement of the trials, there was no opportunity of tuning it up, yet there was no hitch of any kind whatever, and the vehicle made an absolutely non-stop run. The petrol consumption worked out at 13.2 miles per gallon.

*Abstract of Paper read by Mr. C. E. Duryea before the American Society of Motor Engineers, Buffalo, N.Y.

CASES UNDER THE MOTOR CAR ACT.

ON THE FOOTPATH.

For driving a motor-car on the footpath alongside of the highway leading from Perth to Methven, a motorist has been summoned by the Perth County Council. He was fined 10s. and costs.

NO LIGHT.

The Newport (I. W.) magistrates have dismissed a summons against a motorist charged with driving a car without a tail-light in consideration of the fact that the offence occurred on a stormy night.

DANGEROUS DRIVING.

Mr. John Winter, physician, of Montpellier Road, Brighton, has been summoned at the Brighton Borough Bench for driving a steam motor-car at a speed dangerous to the public in North Street. The police estimate of the speed was eighteen miles per hour. The defendant said he was not going at a speed of more than ten miles per hour, and he and the chauffeur mentioned that they slowed up to pass a funeral. The pressure of steam was shown to be low; but the magistrates convicted and fined the motorist 40s. and costs.

A LEGAL POINT.

Mr. Albert George Brown, of Putney, answered at the South-Western Police Court, on Tuesday, to an adjourned summons at the instance of the Police Commissioner for driving a motor-car in Portsmouth Road at a speed dangerous to the public. This particular summons was issued originally conjointly with another charging the defendant with driving the car at excessive speed, and Mr. Barker, for the Commissioner, sought to obtain a conviction in respect to both offences. When the case was first before the court, as reported in the last issue of the *M.C.J.*, the police evidence proved that the defendant travelled over a measured furlong at a speed exceeding fifty miles an hour, and for this offence Mr. de Grey imposed a penalty of £15, with costs. Mr. Staplee Firth, the defendant's solicitor, argued that it would be irregular to punish a man twice over for this, which would be the case were the magistrate to convict on each of the two summonses issued under the same Act of Parliament and embracing the same offence. Mr. De Grey, who had taken time to consider his decision, upheld the objection on Tuesday. The chief element of danger was, he said, the speed, and if he were to convict, he would be convicting twice over. The summons was withdrawn, Mr. De Grey refusing an application for costs.

THE RENEWAL OF LICENCES.

On Tuesday, Mr. Philip Paddon, of Albemarle Street, W., was summoned by the police at Westminster, before Mr. Horace Smith, for driving a motor-car without a licence and without a front identification number plate. P.C. Payne deposed that on the afternoon of the 13th ult. he stopped the defendant at Hyde Park Corner as he had no plate on his car. Mr. Paddon said that he was out trying the machine, and that the plate had dropped off. Requested to produce his licence, he showed one that had expired the previous month. Mr. Curtis-Bennett, counsel for the defence, said the L.C.C. were about the only licensing authority who did not give notice to licensees as to the expiry of licences. They took enormous sums from motorists, and might very well adopt the principle of the Inland Revenue in sending out reminders to business people, for convictions under the Act and endorsements meant a serious penalty for forgetfulness. Mr. Horace Smith said that motor-car people were supposed to be persons of some business-like method. They were different to many people who held dog licences, to whom the Inland Revenue gave notice.

Mr. Horace Smith observed, with regard to the other offence, that he was always being told that the identification plate fell off. He hardly thought this could be so. Surely it was not such a difficult thing to hammer on a plate so that it did not fall off. There would be small fines of 5s. and 10s. respectively on the summonses, with costs, but he would not endorse the defendant's licence.

The Stepney Spare Wheel, Ltd., is now offering an excellent little contrivance in the form of a Stepney mudguard, which rolls up into very small compass, so that it is quite out of the way when not in use, and whenever the Stepney has to be called into requisition it effectually prevents any splashing of the mud.

MR. J. F. BEST, of Messrs. Inglis Bros., Christchurch, New Zealand, reports that of the two 12-h.p. Star cars competing in the reliability trials from Christchurch to Dunedin and back, one secured 998 and the other 994 marks out of a possible 1,000, neither having any mechanical or tyre troubles.

FROM the London and Parisian Motor Company, Ltd., comes a copy of the 1908 catalogue of Vulcan cars, which gives full particulars of the five models, 10-12-h.p. two-cylinder, 14-h.p., 20-h.p., and 25-30-h.p. four-cylinder, and 35-h.p. six-cylinder, which are being turned out. The list also gives illustrations of the different models as well as of the engine and other parts of the chassis, while several pages are devoted to testimonials from satisfied users of Vulcan cars.

THE DAVIS PARAFFIN CARBURETTORS COMPANY, of Shawford, Hants, are exhibiting at the Cordingley Show their patent paraffin carburetors, designed for commercial vehicles, cars, marine motors, and stationary engines. The exhibits will include models of all sizes, ranging from carburetors suitable for engines of from 2 to 100-h.p., and a "Blake" marine motor will be on the stand fitted with the Davis carburettor.

MOTORING IN ABYSSINIA.

THE interesting photograph here reproduced has been received from Mr. B. J. F. Bentley, of whose experiences in Somaliland and Abyssinia some particulars have already been given in these columns. The photograph was taken when within a few miles of Adis Abeba, at the end of a long hill climb of six and twenty miles, with a rise of 3,700 feet. It shows not only the loose and stony state of the so-called "road" but also the dreadfully barren condition of the country through which the Siddeley car and its passengers made their way. When the photograph was taken they had been nearly four months on the journey. Some of their troubles on the way are thus described by Mr. Bentley:—"We crossed the Hawash and Belin rivers famously in 4 ft. 6 in. of water (in places 5 ft.), having first covered the radiator with my Burberry coat; the magneto, petrol valve, and carburettor I covered with special waterproof canvas which I carry for the purpose. Really it was quite a feat. But crossing the Chasm river was another story altogether. The banks on either side were frightfully steep, and very soft; moreover, we had to deal with five feet of water and a soft mud bottom. This was one of the worst water crossings we have had, and required quite a lot of consideration as to the best method of getting the car across. We had not enough lashings for a bridge, so we unloaded the car of all kit, &c., and decided to try and rush through, having covered up radiator, magneto, &c., as in previous case. We succeeded in getting the front wheels on the opposite bank and then we stuck fast. Half the car was in four feet of water, and the back wheels up to the hub caps in the mud bottom. Drag ropes were useless, we could not move her one inch.

There was only one way out of the difficulty, and that was to get the body off as quickly as possible and carry it up first. This we did, working in four feet of water, and a very difficult job it was under the circumstances. Wells worked splendidly, and by our united efforts we had the body off in under an hour and a half. By the time we had got the body up the bank it was getting late and the water was too cold to work in, so we made the car fast and abandoned further work until the morning. The following morning we started as soon as the water was warm enough to work in, and by twelve o'clock we had got the chassis up the bank and refitted the body and left for Daji-Malca.

"Later followed what is undoubtedly the most remarkable hill-climb that any car has undertaken. As soon as it was daylight we started climbing and reached Chobra at 5.30 the same evening with only one stop of 2½ hours at mid-day. The distance was twenty-six miles, and the climb 3,700 feet. The gradients on some of the passes were very narrow and precipitous, and the surface very loose and stony, while in places 1 in 2½, 1 in 3, 1 in 3½, 1 in 4. The engine is running perfectly and is as quiet if not quieter than the day we left London, and up to the present time has not needed an adjustment of any sort, as also the main working parts. Considering the country we have gone through this speaks volumes, and I maintain that up to the moment of writing the car has done the equivalent of three years' hard touring."

THE March list of Sirdar tyres shows that the company are giving motorists the benefit of the recent fall in the prices of raw materials.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

At the meeting of the committee of the Royal A.C., held on Wednesday of last week, there was a long discussion on forthcoming legislation in regard to motor vehicles, and the following resolutions were passed:—1. That the Royal Automobile Club sees no justification for any additional taxation being imposed upon motor-cars. 2. That the Royal Automobile Club considers that the fundamental basis for a calculation of taxation should be "R.A.C. rating." The chairman pointed out that the Club had not sent a "deputation" to the House of Commons to interview the Chancellor of the Exchequer, but had sent representatives of the Club and the trade to lay facts and figures before Mr. Asquith to assist him, so far as lay in their power, in regard to the proposed taxation of motor vehicles on a new basis. These representatives in no way constituted a deputation, as they laid no definite proposition before the Chancellor in regard to motor legislation. The findings of the Royal Commission had been the basis of discussion, and the arguments for and against the several bases of taxation applicable to motor vehicles had been carefully investigated.

The resolutions were endorsed at a meeting of the General Committee held on the following day, when the following sub-committees were formed:—Organising Committee, Legal Committee, Legislation Committee, and Touring Committee. The Organising Committee will consist of twenty-six members in addition to the chairman.

The R.A.C. will elect six representatives and individual associates will be represented by three members, to be co-opted later. The terms

been raised in previous lessons was touched upon, such as the position, accessibility and design of the various parts. Mr. Currie spoke highly of the new induction pipes and the Metallurgique clutch, and explained to the members the new system of aeration of water—which was first seen at the Paris Salon—by means of which radiators are done away with. He also explained the Gillet-Lehmann control and pointed out how much better spherical joints in steering are than the old time pin.

At the last meeting of the committee of the club, Miss Colgate and Mrs. Moreton Frewen were elected to membership. There are now only twenty-two vacancies in the membership list, as it was decided a short time since to limit the number of members to 425.

CYCLE AND MOTOR TRADES BENEVOLENT FUND.

MR. W. A. STANDRING presided at the March monthly meeting of the executive committee of this fund, when a balance of £414, irrespective of £8,000 invested, was reported. Ninety-six subscribers, twenty-six members, one life member, and one life governor were elected and nine applications for pecuniary assistance were considered.

LANCASHIRE.

MR. S. BRIGGS-BURY, of Accrington, has been elected president of the Lancashire A.C., and on the new committee are Messrs. C. F. Bury, J. Briggs-Bury, Dr. J. V. Fox, H. Lonsdale, W. Smith, Havelock Lonsdale, and J. D. Lonsdale. According to the balance-sheet there was a

The Dennis Motor Char-a-Banc supplied to Dr. Vivers, of Sydney, Australia.

of reference to this committee include the encouragement of the co-operation of individual motorists by clubs and other means and the consideration of the assistance that may best be rendered to associated clubs in increasing their membership and conducting their operations.

New members include Earl Beauchamp, K.C.M.G., Mr. S. M. Samuel, M.P., Major E. H. C. Wellesley and Lieut.-Col. J. H. Hodgson.

AUTOMOBILE ASSOCIATION.

MR. WALTER GIBBONS, who is undertaking the direction of the entertainment which will follow the third annual dinner of the Automobile Association at the Hotel Cecil, London, on Wednesday next, has lost no time in securing what promises to be an unique programme. Over 200 artistes will take part, and the secretary will gratefully accept any offer of help in the way of motor-omnibuses for the conveyance of a few troupes to and from their respective variety theatres during the evening.

LADIES.

On Wednesday of last week Mr. Sedgwick Currie, M.I.A.E., addressed the members for the sixth time on the subject of "Petrol Motor-cars." The lesson itself dealt primarily with the 1908 improvements on both petrol and steam cars, but almost every point that had

balance on last year's working of £39, making a credit balance of £77 19s.

LINCOLNSHIRE MOTOR CYCLE.

THE opening event of this club for the season will be the hill climb on Easter Monday—probably at Waddington.

Capt. W. V. R. Fane has been elected president, Mr. A. W. Foster chairman, Mr. A. W. Nissler, 285, High Street, Lincoln, hon. treasurer, Mr. G. J. Wilkinson, 18, York Avenue, Lincoln, general hon. secretary.

The Grimsby centre will hold a pace judging competition from Grimsby to Mablethorpe on Good Friday.

SHEFFIELD.

DISTRICT hon. secretaries have been appointed at Hathersage (for Derwent Valley), Rotherham, and Doncaster.

As the result of representations from the club, certain tramway stopping places in the city have been more conveniently arranged by the authorities.

SCOTTISH MOTOR TRADE ASSOCIATION, LTD.

A MEETING of the Council of the Scottish Motor Trade Association, Ltd., was held in the Royal Hotel, Dundee, on the 25th ult. There were

present Messrs. Thomas Shaw (Dundee), W. L. Sleigh (Edinburgh), J. H. Paterson (Aberdeen), James Gibbon (Glasgow), A. G. Rennie (Glasgow), John Love (Kirkcaldy), Thomas Campbell (Glasgow), and Wm. Rutherford (Edinburgh).

The Council agreed to form local centres of the Scottish Motor Trade Association, Ltd., as follows:—

Edinburgh, under the convenorship of Mr. W. E. Townsend, of Messrs. Middleton and Townsend, Edinburgh.

Glasgow, under the convenorship of Mr. A. G. Rennie, Glasgow.

Dundee, under the convenorship of Mr. Thomas Shaw, Dundee.

Aberdeen, under the convenorship of Mr. J. H. Paterson, Aberdeen.

Fife, under the convenorship of Mr. John Love, Kirkcaldy.

Dumfries, under the convenorship of Mr. A. C. Penman, Dumfries.

THE South Devon A.C. will, in future, be known as the Devon and Cornwall A.C.

MR. G. A. HICKLING presided at the annual meeting of the Burton and District Motor Cycling Club at the George Hotel, Burton-on-Trent.

MR. E. G. MAWBEY was elected an honorary life member of the Leicestershire A.C. in token of the many services rendered to the club during the five years he has been president.

ON Wednesday a paper on "Some Problems Peculiar to the Design of the Automobile" was read at the Institution of Mechanical Engineers before the Institution of Automobile Engineers by Mr. F. W. Lanchester.

BROOKLANDS.

THE following gentlemen have been elected private competitors of the Brooklands A.R.C., in accordance with the scheme outlined on page 23 of our issue of last week:—Viscount Churchill, G.C.V.O., Earl of Lovelace, Sir George W. Abercromby, Marquis de Mouzilly St. Mars, Hon. Lyndhurst Bruce, Capt. J. Bennett-Stanford, Capt. H. H. R. White, Lieut. H. C. Halahan, R.N., Messrs. Clement Hobson, Geoffrey Bird, H. R. Oldfield, Anthony Hoboken, Granville M. Kenyon, J. Stanley Phillips, F. N. Lloyd, Ernest J. Edwards, R. C. Priestly, Morton Stuart, Ernest Owers, G. Curnock Sawday, Thomas A. Scully, E. Campbell Muir, Algernon H. Moreing, J. Stuart Paton, Tom Faulkner, W. C. Bersey, Sidney a'Court, Jas. C. Madeley, E. H. Cozens-Hardy, J. H. Bell, Jairus E. Withers, G. Russell-Miller, O. L. Bickford, C. A. Bird, Howard Hollingsworth, and Herbert Musker.

ROAD REPORTS.

EAST SUSSEX.—£2,000 has been voted by the East Sussex County Council towards the cost of treating the surface of the main roads with tar. This will be divided among the localities that contribute one-half of the cost of the treatment.

CRIEFF.—The Crieff Town Council some time ago petitioned the Secretary for Scotland to restrict the speed of motor-cars on the various roads and streets within the burgh to a speed not exceeding ten miles per hour. Certain objections were lodged by the Scottish A.C. and others, but after some negotiations an amicable arrangement was come to, with the result that practically on all the streets within the burgh the running of motor-cars will be reduced to a speed not exceeding ten miles per hour. Mr. Alexander Stuart, advocate, Edinburgh, who is the Commissioner appointed by the Secretary for Scotland to examine all roads where such petitions are made, has just visited Crieff, and, after going over the list of roads and streets scheduled, he expressed himself as satisfied with the arrangement that had been made, with some slight modifications in the case of several roads in the suburban parts of the burgh.

ORMSKIRK.—A local correspondent informs us that a police trap is likely to be laid down on the Rainford, Mosborough and Ormskirk roads during this week-end.

FOOTS CRAY.—At Maidstone road, Foots Cray, is a police trap which has just resulted in several motorists attending the Bromley (Kent) Petty Sessions.

BROMLEY.—There is a police control from the milestone near the public library at Bromley, to the next one at Mason's Hill.

From Monday next, the 16th, a ten mile limit of speed will, by sanction of the L.G.B., be enforced on the following thoroughfares in Bromley, Kent:—So much of the main London road (including High Street and Mason's Hill) as extends from its junction with Tweedy Road to its junction with Prospect Place; Beckenham Lane, extending from its junction with the main London road to the boundary of the borough; Market Square; East Street; so much of Widmore Road as extends from its junction with Tweedy Road to Market Square.

THE new "Midland" studded tyres, introduced by the Midland Rubber Company, Ltd., are reported to be wearing very well indeed, and a motor hiring firm at Bristol proposes to fit them to all the wheels of their cars on hire, as soon as the present tyres are worn out.

MESSRS. HUMBER, LTD., have been appointed official repairers to the Red Cross Indemnity Association (Lloyd's insurance) and repairs to any make of car up to £15 can be commenced immediately by any of the company's works or depots. Messrs. Humber have also just arranged with the same firm to issue a special Humber car policy at low rates.

THE IRISH RELIABILITY TRIAL.

WITH reference to these trials, which take place in May, and full reference to which was made in our issue of the 22nd ult., we would point out that the differences in the Irish trial of 1908 as compared with last year are not great. The petrol consumption has been taken out of account, because of the difficulty of dealing with it, more especially in checking the exact amount used, as Observers cannot always be relied upon to do this correctly. A prize has been offered for the team of cars which performs best as regards reliability. The formulae for the cups are very much the same; they really worked out most satisfactorily last year. Without any formulae at all, nine out of ten men could have selected the cars which deserved to win; they could also have put their fingers on the runners-up. The experience of last year, needless to say, has been invaluable in suggesting improvements in the formulae. The speed test on Magilligan's Strand will this year form an actual part of the trial.

MOTOR RACING IN FLORIDA.

AS mentioned in our last issue, the annual race meeting on the Ormond-Daytona Beach, Florida, commenced on Tuesday, last week, when Cedrino, on a 60-h.p. Fiat, won the 100-mile race for the Minneapolis Cup in 1 h. 50 min. 20 sec. On the 4th inst. the principal event was an 125-mile race for amateurs. There were only three competitors. Kelsey on a 50-h.p. Christie, Stevens on a 60 h.p. Fiat, and Bergdoll on an 80-h.p. Benz, the latter winning in 1 h. 53 min. 20 sec. On Thursday, the 5th inst., a 256-mile race for the Automobile Club of America's Cup was run. Cedrino, on the Fiat, proved the winner, his time being 3 h. 21 min. 27 2-5 sec. Cedrino went on to establish a record of 300 miles, which he covered in 3 h. 53 min. 27 2-5 sec.—an average

A View of the Boring and Drilling Shop at the Humber Company's New Works at Coventry.

speed of about seventy-seven miles per hour. Cedrino also won the mile race in 35 sec. The meeting was brought to a close on Friday with a 100-mile record race, the competitors being Stevens on the Fiat and Bernin on a 1907 Grand Prix Renault, the latter winning in 1 h. 12 min. 56 1-5 sec., reducing the record for the Beach track by nearly 2 1/2 min.

COLLISIONS AND CLAIMS.

SHERIFF-SUBSTITUTE GUY has issued from Edinburgh Sheriff Court two judgments of interest to motorists. In the one, in which the Scottish Motor Traction Company (Limited) sued Thomas William Wright, Roslin, in connection with a collision which occurred on the evening of September 26th last, on the Penicuik road, between New Pentland and Clippens, the Sheriff decides in favour of the defender, and finds the pursuers liable in expenses. In a note, he says that if the van had carried lights the collision would not have occurred, but as it was no contravention when proceeding at a walking pace not to have carried lights defender was not to blame. When motor-cars trespassed upon what might be the wrong side of the road it was at their own risk. The other case arose out of a collision between two motor-cars on the Queensferry road in July last. The pursuer, Mr. Charles D. Macandrew, 22, London Street, Edinburgh, raised the action against Mr. Henry Cotterill Tillard, M.A., Cramond Bridge. The Sheriff finds the pursuer liable to defender in expenses, having come to the conclusion that the collision was caused both by the fault of defender's driver and the contributory negligence of pursuer's driver.

MR. R. SCAIFE, of Winchester, Mount Armley, Leeds, will be pleased to place his services at the disposal of any motorists who may require assistance when in the locality.

FORTHCOMING EVENTS.

MARCH.

- 18th (W.).—Annual dinner of the A.A. at the Hotel Cecil, London.
 19th (Th.).—Monthly meeting of the General Committee of the Motor Union.
 21st (Saturday)—28th (S.).—
CORDINGLEY'S THIRTEENTH INTERNATIONAL MOTOR-CAR EXHIBITION will be held at the Royal Agricultural Hall, London.
 21st (Sat.).—Annual general meeting of the Council of the Auto Cycle Union.
 25th (W.).—General Conference of Automobilists under the auspices of the Motor Union, to consider the question of motor-car taxation and other Parliamentary proposals affecting motorists.
 26th (Th.).—Ladies' Automobile Club Day at the Motor Car Exhibition at the Agricultural Hall, London.
 29th (Sun.).—Opening Run of the Southend Motor Club to the White Hart Hotel, Witham.
 31st (Tu.).—Last day for receiving entries, at ordinary fees, for the International Touring Car Race.

APRIL.

- 4th (Sat.).—Auto Cycle Union dinner to road-menders on the Ripley road at the Anchor Hotel, Ripley.
 11th (Sat.).—Annual open Flexibility Contest of the Crystal Palace A.C.
 16th—20th.—Easter Tour of the Motor Cycling Club.
 17th (Good Friday).—Lincs. M.C.C. meet at Mablethorpe.
 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.
 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F.
 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Epping.

MAY.

- 1st (F.).—The Frome's Hill Climb of the Herefordshire A.C.—provisional.
 2nd (Sat.).—Impromptu pace judging competition of the Sheffield A.C. at Ollerton.
 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
 10th (Sun.).—Targa Florio Race.
 21st (Th.)—25th.—Reliability Trial of the Irish A.C.
 25th.—Industrial Vehicle Competition of the A.C. de France.
 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
 5th—6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
 Start of the International Touring Car Trial of the R.A.C.
 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
 15th—19th.—Scottish Reliability Trial.
 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
 27th (Sat.).—Hill climb of the Midland A.C. at Shelsley Walsh.
 28th (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
 6th (M.).—Grand Prix A.C.F. (Voiturette section).
 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club.
 Annual Open Hill Climb of the Midland A.C.
 28th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

AUGUST.

- 29th (Sat.).—Meet of the Lincolnshire Motor Club at Lincoln.

LIGHTING-UP TIME—LONDON.

Secretaries of automobile clubs are invited to forward their programme of fixtures as soon as arranged.

INTERNATIONAL TOURING CAR TRIAL, 1908.

THE thirteenth entry for the trial is a 12-16-h.p. Vauxhall (Mr. Percy C. Kidner), Class 4. The Daimler, Straker-Squire, Deasy, Armstrong-Whitworth and Clement-Talbot firms have the matter under serious consideration. The thirteen cars already entered and the entries from the above firms bring the number up to twenty-five.

IN addition to the teams of Austins and Italas, the three Motobloc cars entered for the Grand Prix are using Dunlop tyres on detachable rims of the same make.

CHARGE OF MANSLAUGHTER.

AT Islington Coroner's Court, on Monday, Dr. Danfield Thomas held an inquest on the body of Charles Cox, a labourer, employed by the Finchley Urban District Council, of Hamilton Road, East Finchley, who died on Thursday in the Great Northern Hospital from injuries received through being knocked down and run over by a motor-car on Cherry Tree Hill, Finchley, on Wednesday of last week.

The evidence showed the deceased was employed as a flagman in connection with a traction engine working on the road at this point, and a motor-car driven by John Kitchener, in the employment of Mr. George Glanfield, of South Hampstead, came down the hill at what witnesses variously described as a pace of something from fifteen up to thirty-five miles an hour. In passing the traction engine the car came into collision with a lamp standard in the centre of the roadway, and skidding round caught the deceased and knocked him down, the rear wheel of the car passing over him. The driver Kitchener has already been charged at the police-court with manslaughter. The jury pronounced a verdict of "Manslaughter" against Kitchener, who was committed for trial on the coroner's warrant.

BUSINESS NEWS.

FROM Messrs. Humber, Ltd., we have received an interesting photograph depicting the testing of a crank shaft at Beeston, Notts. Each crank shaft goes through this test and a certain pressure is applied. The crank shaft then goes back on the lathe, and on the least sign of it being out of truth it is scrapped.

THE DAIMLER COMPANY have sent us a photo of the depot they have recently opened at 3, Plaza Celenque, Calle Arenal, Madrid, where the latest types of their well-known car are on view. These premises are in addition to the establishment opened some time ago by the Daimler Company at San Sebastian.

THE AUTOMOBILE CONTRACT COMPANY, LTD., of 51, Conduit Street, desire us to state that they are in no way associated with the company known as the Times System Automobile Company, Ltd., recently trading as Huntley Walker and Co., Ltd.

THE Victoria Street Garage and Showrooms, 94, Victoria Street, London, S.W., has been appointed sole concessionnaires for the United Kingdom for the "Royal" motor delivery vans, which are favourably known in France.

THE FITTON ENGINEERING COMPANY, of 664, Old Kent Road, London, S.E., are undertaking the welding of cracked cylinders, differential cases, &c.

STAREYS AND WOOLLEYS, LTD., is the name of the firm formed by the amalgamation of Messrs. Stareys, Ltd., of Nottingham, and Messrs. John Woolley and Sons, the motor-car body builders, of the same town.

AMONG recent purchasers of Weigel cars is Captain James Persitz, of the Russian Imperial Political Police. He has acquired a 40-h.p. limousine, which has been placed by him at the disposal of the Dowager Empress of Russia, during her stay in England.

MESSRS. DAVID MOSELEY AND SONS, LTD., of Ardwick, Manchester, have issued their 1908 motor-tyre catalogue. Several improvements have been introduced into the "detachable" tyres, to test which the firm have six of their own cars constantly running in all weathers.

THE thirteenth of the series of motor-car exhibitions promoted at the Agricultural Hall, London, by Messrs. Cordingley and Co. will be opened on Saturday next, the 21st inst., and will continue throughout the following week. Several new automobile features of importance will be introduced to the motor world. As was the case at the 1907 Show, the aero section will be of considerable popular interest.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, MARCH 21, 1908.

[No. 472.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

The Cordingley Show.

WITH reference to the thirteenth motor exhibition promoted by Mr. Charles Cordingley, which will be opened at the Agricultural Hall to-day (Saturday), the *Daily Telegraph* says:—"Visitors will find there many cars and accessories that have not previously been shown in this country. There are a large number of exhibitors who have taken space in the hall. This exhibition always is the closing event of the motor show season, and, coming at a time when the buying public wish to have early delivery of their cars, usually produces many orders for the motor-car manufacturers and agents."

To Warn or not to Warn.

ONE of the Local Government Board regulations with regard to motor-cars is that every such vehicle shall carry an instrument capable of giving audible and sufficient warning of its approach. Now the Coroner for Sheffield questions the wisdom of motor-cars having horns, as he thinks if they had not drivers would be much more careful in steering their cars. These remarks followed a suggestion that motorists having sounded their horns thought they had accomplished the whole of their duty. We demur to this rendering of the general practice of those who drive automobiles. They regard the horn as a warning to the members of the public who persist in wandering about the roadways; but that does not take from them the responsibility for careful driving. The public must be warned, and motor drivers must continue to be careful.

The Renewal of Licences.

ELSEWHERE we refer to the question of the renewal of licences to drive motor-cars, and would here take the opportunity of reminding our readers that such official permissions to drive are only available for one year, and have then to be applied for again. They are operative for twelve months from the date on which they are granted, and must then be renewed. The onus of remembering the date on which to renew is apparently left by the Legislature to the licensee—the practice thus differing from Inland Revenue matters. Fortunately, in many places, memories are supplemented by reminders from the registering authorities, and the motorist thus saved a little worry.

The Frome's Hill Climb.

CONSIDERABLE interest has centred around the Frome's Hill Climb in recent years, and the attempt to repeat the event has aroused considerable concern in the locality, where it is viewed from two diametrically opposed aspects. The Bromyard District Council recently appointed a committee to consider the matter, and they have reported unanimously against trials being held on Frome's Hill, a decision that has been communicated to the Herefordshire Automobile Club. Several local people have complained of the damage done to the fields near the hill by the public, whose attendance certainly was all

that could be desired on the score of numbers on the last occasion. It is understood that the objections of the local authorities are not entirely shared by the county police and the authorities of the city of Hereford, who have always shown a sportsmanlike attitude towards this event. Should it be found impossible to hold the contest on Frome's Hill, efforts may be made to secure a private road in one of the many parks in the county, but we doubt whether a more suitable venue can be found. The matter is under the serious consideration of the Herefordshire A.C., and the sooner it is settled the better for the prospects of the meet, should it be decided to hold the same this year.

The Motor-'Bus.

At the half-yearly meeting of the London Road Car Company, to be held on Tuesday next, reference will be made to the competition of the motor-cabs having adversely affected the jobbing department of the company. During the past half-year 270 horse and 160 motor 'buses were running, the number of passengers carried being 40,499,532. The earnings per car mile run have fallen off 1d. per mile in the case of the motor-'buses as compared with the corresponding half-year of 1906. With regard to the motor-'buses, the total cost per mile was no higher than was anticipated at the commencement of the operations; but in the case of horse 'buses there was an increase, largely due to the higher cost of forage. The continuance of the upward tendency in the latter connection should prove a helpful factor to the motor-'bus.

The Roads Improve- ment Association.

THE annual report of the Roads Improvement Association naturally draws attention to the Tar Trials, which were held early last year, and to the various efforts made to keep the subject well before the public. Insistence is again given to the idea of a central department for the main roads of the country, and mention is made of many instances where complaints as to the condition of particular roads were brought before the notice of the proper authorities with satisfactory results. There are now 322 individual members of the Association, and a number of organisations subscribing to its fund, while its Council is representative of many of the leading organisations in which motorists predominate. The Association intends to take a prominent part in the forthcoming International Road Congress, which will be held at Paris early in November, and anticipates that much useful information will be diffused by its means.

Motoring v. Medicine.

MOTORING as a health exercise is a subject that has scarcely received the attention it deserves. Although every motorist has had experience of the exhilarating effect of a run into the country on a speedy motor-car, there are many persons inclined to invalidism who are unaware of the bracing tonic that can be brought to their doors. Mr. J. H. Riddle, in the columns of a morning contemporary, deals with the matter in an observant fashion. In the great majority of morbid conditions the motor-car can be used with benefit as a

health restorer, and only in a few restricted classes of disease can it be said to be harmful. A great point in its favour is that whereas every other branch of sport requires robust health at the commencement, such is not a *sine qua non* for the enjoyment of the pastime of motoring. Accepting as a scientific fact the assertion that 90 per cent. of the chronic ailments that the flesh is heir to are primarily induced by the victim allowing himself to become "run down," Mr. Riddle points out the value of automobiling in such condition. The most marked effect of regular moderate motoring is on the blood, and improvement has generally been noticed in anæmic cases. Neurasthenia is another disease in which motoring has been beneficially prescribed. There are, however, certain nervous states and hysterical and epileptic conditions where indiscriminate motoring might not be wholly advisable. However, as the morbid conditions are few and rare in comparison with those in which distinct benefit from the sport has been recorded, it is not too much to say that motoring holds an unique position in the pharmacopœia of to-day, both from the pleasure which may be got during the treatment and in the multiplicity of ailments in which it has been shown to be of value.

Prince Constantine de Tschernischeff, the private and confidential secretary of the Dowager Empress of Russia, at the wheel of the 40-h.p. Weigel Limousine which has been in the Imperial service since the Empress arrived in London.

On the Trial Route.

THE Committee engaged in the inspection of the routes to be followed in the Scottish Reliability Trial have been hampered in their work during the last few weeks by the severity of the weather, and by the fact that a very considerable number of the northern roads are closed to traffic owing to snow blocks. As an illustration of the conditions up north, we learn that as late as Wednesday of last week the Glenshee road, even on the low-lying portions, was absolutely closed, and that a coach belonging to the Invercauld Arms Hotel had remained embedded in the snow between Finegand and Lair for about a fortnight. There is no prospect of this route to Braemar being available for cars for another month.

In the House of Lords.

REPLYING to Lord Montagu in the House of Lords on Tuesday, Lord Allendale, on behalf of the Government, "strongly suspected that if the Chancellor of the Exchequer contemplated at all getting increased revenue from the taxation of motor-cars, he would wish to keep in his own hands the disposal of that increased revenue, and would not

allow it to be intercepted for the purpose of grants-in-aid." Lord Montagu had asked whether the Government would, in considering any further legislation or taxation relating to motor-cars, bear in mind the recommendations of the Royal Commission on motor-cars and the Royal Commission on London traffic, and take such steps as might be necessary to create a national road authority, by whom the main roads of this country should be managed. The fact that there were no fewer than 170 road authorities between London and Carlisle showed clearly how very necessary it was that a national road authority should be established.

No National Authority.

COMMENTING on the speech, the spokesman of the Ministry, taking advantage of the fact that the subject was mixed up with money matters, pointed out that considerations of finance rarely came within the province of the Lords. The Government had not in contemplation any general legislation on the subject of motor-cars, although it was recognised that an amendment of the law was desirable in some directions. The Royal Commission of 1906 did not recommend that there should be a national road authority, but a central department, by whom the proceeds of licence duties should be distributed. Such a department would have to exercise some control over the maintenance of the roads, but the management would remain with the existing authorities. The Government could not promise to establish even such a body as that, because it would be inconsistent with the policy of local government and decentralisation which had been adopted in this country.

Legislation Postponed.

FROM the speech of Lord Allendale and that of Lord Fitzmaurice who followed with the admission that the multiplicity of road authorities was a great evil, it is evident that little will be done in the direction desired by many motorists, at least, during the present session of Parliament. Apparently the revision of motor-car legislation is to be postponed indefinitely, and the immediate matter of interest centres about the Treasury. The feeling against increased taxation is undoubtedly growing, and should find emphatic expression at the meetings to be held in the coming week.

Motor Lifeboats.

MOTOR-BOATING for utilitarian purposes has been prominently to the front in Wales and Scotland of late. At the meeting of the Cardiff Pilotage Board the question of pilots making use of motor-boats has been discussed, and at a meeting at Dundee on Friday of last week reference was made to motor-lifeboats, Commander Cunningham Graham, R.N., Deputy-Chief Inspector of Lifeboats, explaining that the motor-lifeboat experiments being carried on by the Royal National Lifeboat Institution were not yet complete. The difficulty was as regards the engine or engines which might prove most suitable for installing in lifeboats. He further mentioned that there were only four motor-lifeboats in use by the Institution, that the first one introduced had been the most successful, that it was not the expense which was delaying motor-boats being introduced, as the Institution were determined to keep up with the times, and that he considered the Tay a very suitable station for a motor-boat. Local speakers strongly expressed their views as to the enormous advantage of having a motor-boat stationed on the Tay, and hoped the parent Institution would take the first favourable opportunity of having a boat placed there. The meeting requested the Deputy-Chief Inspector to bring the views of the Committee forcibly before the parent Institution, whose headquarters are immediately opposite the offices of the M.C.J. in London.

**Club
Interests.**

LOCAL circumstances being so widely different are responsible for the varying fortunes of the clubhouses of the numerous automobile organisations throughout the country. At the annual meeting of the Lancashire A.C. reference was made to the poor attendance of members at the club's headquarters. The rooms have been furnished at considerable cost out of money provided by some of the members. Mr. Parker (Preston) expressed great appreciation of the rooms, and Mr. Ashworth and others made suggestions for lectures or other forms of attraction of members. Dr. Stephenson also urged members to use the rooms which the committee had gone to so much trouble to place at their disposal. He also spoke of the meagre support which members gave to the events which had been organised. If members would take more active interest in these events the committee would never begrudge the great amount of time and trouble which they had to spend upon them. Elsewhere we have heard of similar exhortations to members to

premises and a man is employed to wash the cars of members, so that those who motor into Cardiff in the morning may return in vehicles properly washed at the end of the day. The enterprise of the South Wales Club in this matter has proved a great factor in its prosperity.

**Islands in the
Roadway.**

WHILE motorists have been denouncing the centre standards and similar impediments that electrical and other companies have erected in many of the main avenues of traffic, several of our contemporaries have been proposing the installation of other roadway inconveniences. The "Lancet," constituting itself the organ of the puzzled pedestrian, is advocating that, in view of the growth in the number of motor vehicles in the streets, more "islands" should be arranged in the wide thoroughfares of the City, to which those who journey on foot should run for protection when attempting to dodge the rapidly moving vehicles that now abound. By such an arrangement the dangers

The Annual Dinner of the Royal Automobile Club.

encourage the committees of these organisations; and we would add our testimony to the fact that the good work done by those responsible for the management of automobile clubs merits appreciation.

**A South Wales
Club House.**

IN some parts of the country motoring club men are keenly interested in their organisations, and we recently referred to what was being done at Basingstoke with regard to practical matters. Now we learn that the establishment of a motor-house at West Wharf, Cardiff, by the South Wales and Monmouthshire Automobile Club has been a great success. Mr. J. Thompson Willows, the hon. sec., informs us that the establishment has fully justified the expenditure, as members use the motor-house frequently, not only for the purpose of garaging their cars during the day when in town on occasional business or pleasure, but a good revenue is derived from the storage of cars at fixed rates for the month. Members who have not accommodation for their cars at their residences find this feature of the club a very useful one. A caretaker is kept on the

of the streets would be minimised, and the risks of accidents necessarily lessened. The idea is excellent, but its promiscuous adoption might easily prove an aggravation of the congestion already apparent in the Strand and similar important Metropolitan thoroughfares. Probably the solution of the matter will ultimately be found in the institution of the system of subways, such as are found outside the Mansion House. These, located at all the points of greatest traffic, would serve a similar purpose to the bridges across the river; but experience has shown that, even at the Mansion House, people will run the risks of the road rather than go down the stairs and through the tunnel that undermines the street.

AT the annual meeting of the New York State Association of Postmasters, recently held in New York, the chief of the New York post-office gave his personal endorsement of the motor-car, and suggested its use as a solution of one of the present dilemmas of the department, which arises from the difficulty of securing prompt deliveries of periodicals in the residential sections of the city.

THE RENEWAL OF LICENCES.

LAST week, in our notes on cases under the Motor-Car Act, we recorded an instance at the Westminster Police Court, when a motorist was summoned for driving a motor-car without a licence. It transpired that his licence had expired some days before the police requested its production, and his counsel, at the police court, said that the London County Council were about the only licensing authority who did not give notice to licensees as to the expiry of licences. This is done in the case of Inland Revenue licences, and the man with a dog is more courteously treated by Officialdom than is the man with a car. The London County Council, which issues more licences to drive automobiles than any other registering authority, conducts its business in most primitive fashion. The applicant ascends to the office in a small lift, and, having duly filled in the form, makes a descent to see the cashier. Then he returns to the first office to secure the licence, and has again to employ the lift to find his way out. The disposition of the various departments is most tedious, and, to the applicant for the licence, absurd. Fortunately the officials are courteous; their patience under the present

Touring in Belgium.—A View on the River Sambre near Namur.

circumstances deserves recognition when the new County Hall is erected.

The magistrate at Westminster having apparently upheld the L.C.C. in its practice of not sending notice of the approaching expiration of driving licences, we have made a few inquiries as to the plan followed elsewhere. There is no uniformity—although a preponderance of councils wisely notify drivers when the time for payment is drawing near. This was done at West Ham at the end of the first year of the operation of the Act, but the results obtained did not justify a continuance of the practice. Similarly the County Council of Shropshire for the first two years after the commencement of the Act reminded drivers by advertisement in the local papers of their necessity for renewal. The authorities at Edinburgh, Coventry, Bradford, Leicester, Bristol, and Liverpool do not inform motorists of the expiration of their licences.

Although the Bristol local authorities do not give direct notice to holders of motor-car or motor-cycle licences of the expiration of the same, attention is occasionally drawn in the local papers to the risks motorists run in driving without a licence, and this, we are informed by the Town Clerk of the city, "acts as a reminder to many, who forthwith renew their licences." It is the practice to always notify the licensee when his licence has expired at Glasgow, Dublin, Belfast, Manchester,

Burton-on-Trent, and Croydon. The same course is also followed in the counties of Berkshire, Glamorgan, Nottingham, Hereford, and Norfolk. Although the Warwickshire County Council does not inform drivers of the date when their licences cease, the clerk sends them a form of application for the renewal of their licences about a fortnight before they expire—a timely reminder that should be appreciated, and might well be imitated by those authorities that do nothing in the matter.

It is the practice in Leeds to forward a circular to the holders of motor-cars and motor-cycle drivers four or five days before the licence expires, reminding them of the date of expiry, and asking for the production of the licence at the office of the Hackney Carriages Department in the city. A similar form is used by the Oxfordshire County Council, which, in the event of the actual licence not being sent for renewal, issues a separate form of renewal to be attached to the original licence. One of the neatest forms of reminders is that used at Birmingham, as follows:—

Birmingham City Police.

Public Carriage Department,
Coleridge Passage,
Birmingham,

Sir,

"Renewal of Drivers' Licences, Motor Car Act, 1903."

I have to inform you that the Licence to drive a motor car, granted you under the Motor Car Act, 1903, will expire on the and to inform you that if you desire to renew the said licence it will be necessary for you to fill in the particulars required in the enclosed form, and forward same, together with your old licence, to Inspector Burton at the above address, who on receipt of a fee of five shillings will return the licence renewed for the ensuing year.

I am, sir,

Your obedient servant,
CHARLES HAUGHTON RAFTER,
Chief Constable.

Hitherto it has been the practice of the Surrey County Council to forward to every holder of a driving licence, within one month before the expiration of his licence—the time within which a licence may be renewed—an application form, addressed envelope, and letter with full instructions, and stating that the form must be filled in and returned in the event of the applicant desiring to renew his licence. This practice, though not obligatory under the above Act, entails a considerable amount of extra time and work, but it saves the applicants the trouble of writing to the office for the application form. Notwithstanding this care on the part of the authorities, the number of motorists who take no notice of it is surprising. They either send their licence without the form, in which case the form has to be written for, or they send the form and licence a day or week after the stipulated time, which latter case necessitates the sending of another form and the issuing of a new licence altogether, owing to their licence having expired. Under these circumstances we believe the Council are considering the question of discontinuing the above practice and allowing motorists to make their applications in the first instance.

From this cursory review it will be seen that the responsibility in the matter really rests with the motorist, who should not forget that his licence is only available for twelve months from the date of being taken out, and that the onus of renewal rests with himself, without any previous notification from the licensing authority.

MESSRS. SKILMAN AND CO., of the Colchester Motor Works, Osborne Street, Colchester, have sent us a copy of a circular they have lately issued showing a comparison of the relative costs of running horsed and motor vans. On one side is shown the capital outlay for two vans and six horses (£310), and the annual running expenditure, including interest and depreciation (£499). Each two-horse van is estimated to run an average of thirty miles per day for 300 days in the year, giving a total mileage of 18,000. On the opposite page the first cost of a 12-14-h.p. 20 cwt. van is set down at £410, and the annual running expenditure (sixty miles per day for 300 days annually) at £364 10s. A saving of just over £135 per annum is thus effected.

The Cordingley Motor Show.

CORDINGLEY'S thirteenth International Motor Car Exhibition opens to-day (Saturday) at the Agricultural Hall, London, and will be the great attraction in motoring circles during all next week. Below we commence our review of the stands forming this representative Exhibition. This will

Fig. 1.—Cross Sectional View of F.N. 14-16-h.p. Engine, showing "desaxe" crankshaft.

be concluded in the following issues, and the complete report will form a good introduction to the 1908 season.

The F.N. 14-16-h.p. Car.

A Belgian-built car which makes its first public appearance in this country is the F.N., built by the Fabrique Nationale d'Armes de Guerre, of Herstal, near Liege, the makers of the well-known F.N. motor-cycles. Apart from their relative low price combined with excellent construction there are many points of interest in the new vehicles, which are to be seen at the stand of

A feature of the design of the engine is that the crank shaft, which runs in three long bearings, is slightly *desaxe* or off-set. The base chamber is so constructed that the bottom half can be removed without disturbing any of the bearings. The ignition is by a high tension magneto, gear driven off the half time shaft, while the carburettor (Fig. 2) is of the automatic single jet variety with piston throttle. The clutch pedal is also connected

Fig. 2.—The F.N. Carburettor.

up to a separate butterfly valve in the admission pipe in such a way that when the clutch is withdrawn to change speed or at any time, the speed of the engine is automatically cut down. The lubrication of the motor is effected by a pump which forces the oil to a gauge on the dashboard, whence it flows to the different bearings. The water circulation is maintained by a gear driven pump and framed ribbed tube radiator with fan.

As regards the transmission, the clutch is of the leather faced coned type. A flexible joint is introduced in the shaft between the clutch and gear-box to allow for any want of alignment between the two parts. The change-speed gear is adapted to give three speeds forward and a reverse with a direct drive.

Fig. 3.—Elevation of Chassis of F.N. 14-16-h.p. Car.

the F.N. MOTOR AGENCY. The frame is of pressed steel narrowed in front to increase the steering lock, and raised at the rear to give clearance for the differential casing; the suspension is by means of five semi-elliptical springs. The engine (Fig. 1) comprises four cylinders cast in pairs, with the inlet and exhaust valves all located on one side and operated off a single cam shaft.

on the top speed, the side shaft then being entirely out of gear. The final transmission is by a double universally-jointed propeller shaft and bevel gear to a live axle. A view of the latter is given in Fig. 4 from which it will be seen that the design is such that it should give satisfactory results in practice. The differential casing is of steel, made in two halves, which bolt

together in a horizontal plane. The road wheels run on the axle-casing, the power being transmitted to them by jaw clutches on the ends of the live shafts. By removing the hub caps the shafts can be withdrawn, enabling the differential gear to be readily removed when necessary. The bevel driving pinion is provided with a bearing both at the front and rear.

The front axle is of H-section steel, while it may be added that the brakes, both hand and foot operated, are of the internal expanding variety, and that ball bearings are fitted throughout, except to the engine. The chassis, which has a wheel base of 8 ft. 9 in., which enables any type of body to be fitted, weighs only 13 cwt. Altogether the F.N. car is well worthy of inspection.

The Stella Cars.

Some excellent specimens of Swiss automobile engineering are to be seen at the stand of the STELLA MOTOR COMPANY, LTD., who are exhibiting a Stella 16-20-h.p. chassis and a complete car of a similar power with side-entrance Roi des Belges body to seat five persons (Fig. 5.) These vehicles, which are made by La Compagnie de l'Industrie et Mecanique, of Secheron, Geneva, comprise a number of interesting features. The engine is of the four-cylinder type, cast in pairs (90 mm. bore by 120 mm. stroke), with the valves set on opposite sides. One of the most interesting features of the cars is the carburettor, which can not only be quickly detached, but is of the multi-jet type. There are

Fig. 4.—Sectional Plan of Half of Back Axle of F.N. Car.

altogether four jets, the small outlets in which vary in size; these are so arranged that as the speed of the engine increases the supply of petrol to the vaporising chamber is rendered proportionate to the air. The main inlet for the latter is through holes in the body of the device at the side of the jets, while the additional supply is through an automatic valve below. The ignition is by low-tension magneto, the tappets being so arranged that they can be readily adjusted. The bottom half of the base chamber is so fitted that it can be detached without disturbing the crank shaft or its bearings, while the bracket for the support of the starting handle is an integral part of the motor. No mud-protecting shield of the usual pattern is employed, the base chamber being extended at the sides so as to serve the same purpose. The flywheel and clutch are also provided below with an aluminium shield, this being bolted at the forward end to the crank case. The change-speed gear is gate controlled, and gives a direct drive on the top third speed. The final drive is by a cardan shaft and bevel gear to a rear live axle. A useful feature of the sleeve surrounding the latter, and of the differential casing, is the plane surface, any necessary webs being inside; thus there are no corners in which mud and dirt can collect. Very long dumb irons are provided at the rear, which enables springs of good length to be fitted. The clips which connect the springs to the axle casing are not rigidly fitted to the latter, but are free

to move to a slight extent to allow for any variation in the relative positions of the two parts. Needless to say, ball bearings are fitted to all parts except the engine.

The Standard Steam Wagon.

A new-comer in the steam wagon world is Messrs. T. J. RAYNER AND SONS, of Rayleigh, Essex, who show for the first time the "Standard" machine, which has been designed by one of the first steam wagon designers in the country. Two speci-

Fig. 5.—The Stella 16-20-h.p. Car.

mens of the "Standard" steam lorry are exhibited. One is of the firm's standard design for general work, and carries a load of five tons. The other is specially built for Colonial work. The road wheels are made of an extra large diameter, 4 ft., and of steel, in order to prevent risk of shrinkage in hot climates. The tread also is of extra width, in order to bear up the wagon when it is passing over soft grounds. In other respects the Colonial wagon is similar to the standard home pattern. The platform area available for the carriage of goods is seventy-five square feet, the flat body being 12 ft. 6 in. in length and 6 ft. 6 in. wide. The overall length of the machine is 19 ft. 3 in. The engine is sufficiently powerful to propel the vehicle up hills of 1 in 7 with ease. A trailer with an extra load of three tons may also be used with the lorry. The engine is of the horizontal type, compound, and reversing. The cylinder dimensions are 4 in. by 7 in. and 6 in. stroke. A normal speed of 500 revolutions per minute is provided for. Slide valves are fitted. The reversing gear is of a new type designed by the firm; it gives a variable "cut-off" with a constant lead. The method of transmission is from the crankshaft through two spur wheels to a second motion shaft, these wheels giving changes of speed. Thence the drive is

Fig. 6.—Plan of Chassis of Stella 16-20-h.p. Car.

to the differential gear and by Renold side chains to the rear road wheels. The engine and gearing are entirely enclosed in a dust-proof casing and run in an oil bath. Accessibility is a strong feature of the running gear, all of it being easily got at without the removal of any portion of the load. The boiler is of the locomotive pattern, horizontally and longitudinally fixed. The frame is of strong channel steel section, 6 in. by 2½ in., and is well supported by cross members of similar section, all well

riveted and gusseted. The main springs are of the semi-elliptical laminated pattern, and of a nicely-judged length to ensure easy riding. The steering is irreversible, and all the thrust is taken on a ball-bearing. For home use, artillery pattern road wheels are used. The water tank at the rear rests over the back axle. It has a capacity of 170 gals. The boiler feed-pump is driven from the crankshaft, and an auxiliary steam pump is also fitted, together with an injector.

The Yorkshire Steam Wagon.

The YORKSHIRE STEAM WAGON COMPANY, of Hunslet, Leeds, are exhibiting a steam wagon (Fig. 7) similar to that which successfully carried off a gold medal in the recent Industrial Vehicle Trials. We cannot do better than extract the particulars

Fig. 7.—The Yorkshire 6-ton Steam Wagon.

of the points of the "Yorkshire" steam 6-ton wagon from the tabulated information given in the report of the trials:—The steam motor is of 35-h.p. Channel steel is entirely employed in building up the frame. The engine is of the compound type, the diameter of the pistons in inches being $4\frac{1}{2}$ and $7\frac{1}{2}$ respectively. The length of the stroke is $7\frac{1}{2}$ inches. Normally the number of revolutions of the crankshaft per minute are 350. The method of transmission of power from the motor to the rear road wheels is by a single chain. The full load which the vehicle is constructed to carry is, as already mentioned, six tons. Two speeds are provided for. Unladen, the wagon weighs 4 tons 19 cwt. In deciding upon the merits of the Yorkshire steam wagon, the trials judges took into consideration the fact that the total number of days it ran during the trials was twenty-two—the full period. The total distance run was 688 miles. Coal and coke were used as fuel in the following quantities, viz., coal, 3 cwt., coke, 108½ cwt., and wood, 270 lbs. The consumption of coal per mile was accordingly 18.25 lbs. In the way of lubricants, the wagon used—oil, 98 pints, grease, 1 lb. Time occupied by all stoppages other than those caused by traffic, or which were compulsory, 9 hrs. 43 min. As with all steam wagons, the greater proportion of this time was occupied in taking in water. The vehicle was highly commended for its adequacy of platform area, adhesion, finish and workmanship, freedom from smoke, general appearance, hill climbing, steering gear, and cost per net ton-mile; and commended for accessibility, brakes, and condition after trial.

The Foden Steam Wagon.

One of the most prominent exhibits in the industrial vehicle section of the Show is that of Messrs. FODENS, LTD., of Sandbach, Cheshire. It comprises two steam wagons, both of their well-known and remarkably successful traction type. Messrs. Foden have had many years' experience in building traction engines, and are as well conversant with the requirements of a traction engine as any traction engine maker in England. When they took up the manufacture of steam wagons to deal with loads which traction engines could not profitably carry, it was but natural that they should adopt the general design of a road engine which had been evolved from many years' experience. Accordingly, the Foden lorry is a small traction engine, having an overtake engine—that is, the

engine is mounted over the boiler, which is of the locomotive pattern. Of course the drive had to be transmitted to the rear road wheels, and it was inadvisable to slavishly follow the traction engine with its direct spur gear of large diameter. The firm therefore decided to use a heavy roller chain to take the drive to the rear road wheels, and the experience of users with Foden wagons proves the wisdom of the decision. Both the vehicles exhibited are designed to carry loads of 5 tons, and this they will do with ease at a minimum running cost. One is an eighth repeat order from Messrs. Joseph Rank, Ltd., millers, of Bury, London and Hull. The other Foden wagon is a third repeat order from Messrs. Wright and Son, millers, of Ponders End, London.

The Savage Steam Wagon.

Messrs. SAVAGE BROS., LTD., of King's Lynn, Norfolk, exhibit a steam wagon similar to that which secured a gold medal at the recent Industrial Vehicles Trials. The salient features of the vehicle (Fig. 8) are as follows, viz.:—Motor, 35-h.p.; frame, channel steel; front tyres, steel, 36 in. by 6 in.; back tyres, steel, 42 in. by 10 in.; number of cylinders, two; diameter of piston in inches, $4\frac{1}{2}$ and $7\frac{1}{2}$; length of stroke in inches, 6; number of revolutions of crankshaft per minute, 450; method of transmission of power from motor to wheels, spur gearing and side chains; full load which the vehicle is constructed to carry, six tons; number of speeds, two; weight unladen, 5 tons 3 cwt. 2 qrs. The points for which it was awarded the gold medal in the trials above referred to are summarised below. Total number of running days, 22; total distance run, 688 miles; nature of fuel used, coal; quantity, $74\frac{1}{2}$ cwt.; wood, 220 lbs.; lubricants, oil 30 pints, paraffin 8 pints; time occupied by all stoppages for water and other than those caused by traffic, or which were compulsory, 5 hrs. 47 min. General remarks:—Highly commended for—Accessibility, adhesion, condition after trial, ease of manipulation, finish of workmanship, freedom from smoke, quiet running, steering. Commended for—Cleanliness, cost per net ton-mile. Messrs. Savage also show one of their "Little Samson" tractors.

The Universal Tractor.

A machine which can be used as a tractor or lorry and runs on three wheels is shown by Messrs. SAUNDERSON AND CO., LTD., of Elstow Works, Bedford. The principal feature of the

Fig. 8.—The "Savage" Steam Wagon.

"Universal Tractor," as the machine is known, is the driving of each road wheel—the single central rear wheel by a chain and the two front (steering) wheels by positive bevel gearing. The tractor is well adapted for agricultural work, such as ploughing, mowing, reaping, and threshing, while for hauling it has a sound reputation. The engine is very powerful, and has a reserve of energy which will carry it as well through a day's ploughing on tough land as on lighter soils. Paraffin fuel can be used, and this is an important point for farmers to remember, as the cost of operation is brought to a very low figure.

A New Agricultural Motor.

SHARP'S AUTO-MOWER AND TRACTION COMPANY, of York, are showing the lightest agricultural motor built in England. It drives (not trails) a 5 ft. 6 in. mowing machine, and will cut thirty-five acres in ten hours. It ploughs at the rate of five miles per hour, using a 3-gauge plough. It is fitted with a pulley for driving practically every machine found on a farm. It will

Fig. 9.—The McCord Lubricator.

also haul two tons over a field and three tons on a road rising 1 in 8. The cost of fuel is very low, paraffin at 5½d. per gallon being used. The machine consists of a substantial channel steel frame, on which is mounted a 12-14-h.p. engine. Power is taken through the usual leather-lined cone clutch to a gear-box which contains the forward and reverse gears and spur differential; only one forward speed is provided for. For working the cutter, an

Fig. 10.—Details of the McCord Lubricator.

eccentric running on a ball race drives the cutter bar. All the bearings on the transmission shafts are of the Hoffman ball type.

A New Plug.

Messrs. S. and F. STEPHENSON, of Canning Place, Liverpool, who are agents for the Jeffery-Dewitt Company, of Newark, New Jersey, are showing a sparking-plug which will be of general interest. In the Reliance Spark Plug, as it is called, the insulated sparking point is a platinum wire, entirely protected

from corrosive action by being baked in and brought flush with the porcelain insulator. The spark in leaving this minute point is concentrated and intensified to such a degree that the heat and scouring action, being directed against the surface of the insulator, instantly destroys any short-circuiting matter surrounding the point. Thus it is possible to utilise the entire energy of the battery and coil to produce the maximum heat in the spark, ensuring regular and perfect ignition. The action is purely electrical, no moving parts or valve actions being employed, the plug requiring absolutely no cleaning or attention. Mechanical details have received attention, and the porcelain, which is of a new heat-proof composition, is flexibly supported by asbestos wicking compressed within a metal sheath, making the porcelain, packing and sheath one element. The merits of the plug are demonstrated by the water test, as the plug sparks as readily in the water as in the air.

The McCord Lubricators.

Messrs. EASTON AND MELVILLE, LTD., who are the concessionaires for the McCord lubricators (Figs. 10 and 11), are exhibiting examples of these well-known devices as well as of their Ilo lubricating oil, which is favourably known among motorists. The lubricator is well made and can be obtained with any number of feeds as desired. The reservoir is of sheet brass reinforced with cast frames, ensuring rigidity as well as strength. The supply is regulated above the cover of the reservoir directly behind the sight feeds. The central feature of the McCord lubricator is the pump. Each pump has two plungers, a suction and a delivery. On the up-stroke of the suction plunger oil is drawn from the reservoir through a screen or filter; on the downward stroke the

Fig. 11.—Class "O" McCord Lubricator.

oil is forced up to and drops through a sight feed. At this point the second or delivery plunger, on the up-stroke, draws the oil out of the sight feed and on the down stroke pumps it to the bearings. Although for the sake of clearness the movement of the oil is thus traced through the two pumps separately, in reality the two pumps are operated simultaneously, consequently the oil is taken from the reservoir and delivered to the bearings at the same time. Steel balls are used as valves, operating automatically with the upward and downward strokes of the plungers, thus pressure or vacuum in the engine have no effect on the lubricator, which continues in either case to constantly deliver the amount of oil for which it has been regulated. Each pump is regulated separately to force any required amount of oil, from a fraction of a drop to a stream, and once having been adjusted will not get out of adjustment. The lubricator "Class O" (Fig. 11) is also shown, in which the action of the pumps is the same as that already described, but is designed to fit directly behind the dashboard, the sight feed only appearing through for the driver's convenience. With this type an auxiliary oil tank is necessary, which is placed on any part of the chassis found most convenient. The action of the pump draws the oil from this auxiliary tank without the aid of any outside pressure. Several other motor specialties add to the interest of the display by Messrs. Easton and Melville, Ltd., whose headquarters are at 85, Shaftesbury Avenue, London, W.C.

(To be continued.)

GOSSIP FROM PARIS.

M. BARTHOU has presented to the Chamber the long-talked-of Bill—I was going to say against automobilists, but I will keep to the official wording and call it a Bill for the regulation and control of the traffic by mechanically-propelled vehicles. Why the Minister of Public Works should have been entrusted with the preparation of such a measure, and why the Minister of the Interior, who is responsible for the safety of citizens on the road as well as in their houses, should have contented himself with countersigning it with the Minister of Justice, is a mystery. It may be that M. Clemenceau foresaw the discontent it would create. In any case, though the full text of the proposed measure is not yet published, the official note concerning it reveals enough to show that it is an exceptional measure. Consequently, apart from every other consideration, it must be pronounced bad. In addition to proposing to make a law against a special category of citizens, the Bill, if adopted by Parliament without modification, would create a category of "suspects." One of the leading stipulations of the Bill is that the right to withdraw definitively or temporarily the licence of an automobile driver who may have infringed the regulations governing auto-traffic is to be transferred from the prefectural authority to the judicial authority. A person who may have committed a breach of those regulations, punishable with three days' imprisonment, will be liable to be deprived of his right to drive during a period varying between eight days and two months. In the case of a fatal accident or serious injury to persons the motor-car driver could be deprived of his licence for a whole year. Then comes, as the French say, "Le bouquet." A special register is to be kept at the Ministry of Public Works for the inscription of the names of all those persons whose licence has been withdrawn altogether or temporarily. That will be the list of "suspects." Even those who approve the severity of such stipulations must admit that if they are to be applied to automobilists they should also be applied to the drivers of horse-drawn vehicles. How, indeed, could the case be decided when a collision occurred between a motor-car and a horse-drawn vehicle? The respective drivers would not be subject to the same jurisdiction nor punishable with the same penalties. Again, an automobile driver who should accidentally run over a pedestrian, killing or seriously injuring him, would be deprived of his driving licence at once, even before trial; whereas if a butcher's boy should, by furious driving, accidentally kill an old lady or a child, he could not be prevented from driving the same cart the very next day and all his life afterwards. It is true M. Barthou's Bill has not yet been discussed, and there is every reason to anticipate that before it becomes law it will be seriously modified; yet in automobile circles there is a general outcry against it. The discontent is all the stronger because even the official statistics show that, though between 1903 and 1906 the automobiles in France tripled, the number of accidents caused by them increased only one-fifth. M. Barthou's Bill contains numerous other vexatious stipulations which it is unnecessary to insist on at the present moment. Nearly all the automobile firms have already protested strongly against the proposed law, which would, they contend, be a very serious blow to their industry, which is even now so hard pressed by foreign competition. The Automobile Club of France itself raised the cry of alarm, and has sent out copies of a petition against the proposed measure to every town, village, and hamlet in the country. 200,000 copies of the document have been distributed, and when they are returned to the Club covered with signatures, they will be laid on the table of the Chamber by Marquis De Dion, vice-president of the Club, and deputy for Nantes.

Even the existing regulations concerning automobile traffic are incoherent and vexatious. An Englishman touring in France in his motor-car would scarcely imagine that if by chance, in traversing Paris or any other large town, smoke should escape from the exhaust pipe, or if his vehicle should not be provided

with the regulation lights after dark, he would be liable to imprisonment as well as fine. Such is, however, the case. And, what is more extraordinary, he would be condemned if he were not in the car and did not even know it was in the street. I cannot say that is the law, but it is the police regulation, and the so-called offence may be noted without the driver being aware of it. The automobile police often content themselves with taking the number of the car as it passes, and the unfortunate owner receives a summons to appear before the police tribunal, which always condemns him without listening to what he has to say in his defence. The jurisprudence adopted in the case of a breach of the regulations concerning the lamps or the escape of smoke is that the owner must be condemned to prison and the driver to a fine. Of course, as the owner is civilly responsible for his driver, it is he who also pays the fine and the costs of the case. On appeal this sentence of the police magistrate is almost invariably quashed, but the legal proceedings cost dear, and the motorist's patience and urbanity are put to a severe test.

WHILE the wind was blowing and the rain was pouring down in torrents, about a week ago, a select party of aeronauts were consoling themselves with a dainty dinner at the Café de la Paix for the inclemency of the weather, which had for so long compelled them to keep the doors of their aeroplane sheds hermetically closed. The excuse for the meeting was the settlement of bets which had been gained and lost in connection with Mr. Henri Farman's flight on January 13th at Issy-les-Moulineaux. M.M. Archdeacon, Charron and Santos Dumont, having been the winners, were the hosts, while among the guests were the Duc Decazes, M.M. Henry Kapferrer, Rene de Knyff, Louis Renault, Michelin, Georges Besancon, Jacques Faure, de Blest-Gana, A. de Siguera, Captain Ferber, Henri Farman, Gabriel and Charles Voisin, Loyse, Prade, &c. The dinner was delicious in itself, and the generous wines of France had driven away the melancholy thought that probably many days would elapse before the flooded parade ground at Issy would be dry enough for aeroplanes to take their flight from it, when conversation became general concerning the prospect of further great progress being made in the Conquest of the Air during the coming season. The bewildering results already achieved inspired high hopes, and another bet, which will entail a further dinner at the Café de Paris at the latest at the end of a year, was made. M.M. Archdeacon, Henri Farman, and Santos Dumont bet M. Charron £240 to £480 that an aeroplane carrying two persons, the driver and a passenger (the latter weighing at least 132 lbs.), will fly a kilometre before the expiration of twelve months. They naturally hope the dinner will not be delayed long. In any case, it may be relied on that both Henri Farman and Santos Dumont will do their best to place M. Archdeacon and themselves in a position to issue the invitations for the dinner at an early date. Fortunately, the weather cleared up quickly, and a couple of days' March wind dried the parade ground at Issy sufficiently to permit the aviators to resume their experiments sooner than they had expected. Mr. Henri Farman was out the first with his old aeroplane, improved and fitted with a 50-h.p. Renault motor. On the first day the machine left the ground easily, but certain defects which made it lean on one side had to be rectified. The following day Mr. Farman flew pretty easily, veering without difficulty. M. Delagrangé, who possesses an aeroplane very similar to that of Mr. Farman, last Saturday succeeded in flying about a quarter of a mile. A number of other inventors are also ready to commence their experiments. M. Louis Blériot has reconstructed and improved his monoplane, which had been wrecked so often, while M. Pischoff is about to resume his experiments at Issy les Moulineaux. The monoplane built by Comte de la Vaulx is ready for trial, as well as that invented by M. Henry Kapferrer. M. Esnault-Pelterie is building a machine with which he hopes to obtain grand results. There are several other persons who have constructed aeroplanes during the winter, and are waiting to try them till they are allotted space for their sheds on the ground at Issy, of which the Aero Club of France has obtained the concession.

MARNEY.

THE WINDHAM DETACHABLE MOTOR BODIES.

SINCE we last described the Windham detachable and interchangeable motor bodies, about a year ago, several detail improvements have been effected in the system, which, judging from the large amount of work we saw in hand when recently visiting the works of the company at 22B, St. John's Hill, Clapham Junction, S.W., is enjoying considerable popularity. Briefly, the system consists in fitting to the side members of the frame of the chassis a small and light steel flitch plate, which, when in position, forms an L-shaped guide. The

A C.G.V. Car with Racing and Side-Entrance Bodies on the Windham System.

lower edges of the sides of the rear part of the interchangeable body, which are provided with a long brass strip, are made of corresponding shape, so that the latter may slide into position from the rear. The guide plate is at intervals slightly countersunk, to receive rollers, which facilitate the sliding action of the body. The fit is so accurate that it is impossible to detect that the body is of the detachable type; the extreme forward portion of the bottom part of the body is cut aslant, and abuts closely to the rear ends of the woodwork of the front seats. When quite "home" the body automatically locks itself in place by means of two special catches, in such a way that there is no danger of its becoming accidentally detached or rattling. Another recent improvement is a safety catch in connection with the side doors, which prevents the body being slid back unless these are locked, so that there is consequently no danger of the varnish of the door panel or the mudguards being inadvertently damaged. Usually the front seats are fixed, but where those of a side-entrance body are of such a form as not to correspond well with the lines of a landaulet, they can be made so that the whole of the open body can be removed and replaced by a complete covered one. Apart from the advantage of a detachable body in giving access to the gear-box, to differential shaft of chain-driven cars and to the live axle of gear-driven vehicles, its main feature is, of course, the facility it affords of converting a car to different purposes. Thus, with one chassis a motorist may have on hand a side entrance double phaeton, landaulet for town use, or shooting brake body, any one of which can be placed in position in less than a minute, or a luggage-carrier can be fitted converting the vehicle into a two-seated touring car. Again, for tradesmen's use, the pleasure body, either closed or open, may be readily replaced by a delivery van, the spare bodies all being stored on their own castor-fitted legs, or special carrier in the case of heavy bodies, the height of which is so adjusted that the lower edges of the bodies are on a level with the flitch-plate guides on the chassis. The illustration given herewith depicts a C.G.V. car which has recently been provided with two detachable bodies—racing and side-entrance—on the Windham system. While it is impossible to detect where the rear part is joined up with the forward fixed

section, by simply opening the tool chest at the rear and lifting the safety catches it is possible to pull the detachable portion to the end of the guides and on to the supporting legs in a few seconds, this without the use of any tools. In fact, one body can be taken in less than half a minute and the second placed in position in an equally short space of time. Altogether the Windham arrangement is a step forward in motor-body construction, and one that has already met with recognition at the hands of all the leading carriage builders, over sixty of whom—in addition to the Humber Company, Ltd.—are now constructing motor-bodies on the system under licence from Capt. Windham. We may add that it is applicable to all sizes and types of chassis, and that existing bodies can be adapted to the sliding detachable principle.

In connection with the bodies a brief reference may also be made to the method of fixing the mudguards, these being so fitted that not only can they be readily detached from the car, but they can also be adjusted over a Stepney spare wheel when, owing to tyre troubles, it has been found necessary to place this in position.

A NOVEL TYRE PUMP.

AMONG the novelties at the recent Paris Show was the ingenious tyre inflator illustrated herewith; it has been introduced by Messrs. Gronvelle and Arquembourg, of Paris, the well-known makers of radiators, carburettors and other motor components. Reference to the illustrations will show that the apparatus comprises a short steel cylinder mounted at one end on a stout wooden handle. Within the cylinder is a gunmetal piston or plunger connected by a rod to the crank pin of a disc held in a stout fork at the other end of the pump barrel. The rim of the disc is leather-faced like the wheel of a friction-driven water-circulating pump. The tyre inflator is fitted with a non-return valve and a pressure gauge; the air delivery tube

Fig. 1.

from the pump is connected to the tyre valve in the ordinary way when it is desired to inflate a tyre. All that is then necessary to pump up the tyre is to take the device by the handle upon which it is mounted and press the leather-rimmed disc against the periphery of the flywheel when the engine is running light, and hold it there until the pressure gauge shows that the tyre is sufficiently inflated. It is stated that with a pump disc 6 in. in

Fig. 2.

diameter pressed against an average sized flywheel a 120 mm. tyre can be fully inflated in four minutes. The overall length of the apparatus is 26 in., so that it can be readily stowed away on the car.

A HISTORY of the parishes in the county of Kerry, together with many authoritative notes on the antiquities of the district, has been published by Mr. J. King, 302, Anfield Road, Liverpool. In alphabetical order the various points of interest are described, and those who take part in the forthcoming Irish Reliability Trials can add to the interest of their stay in Kerry by previously perusing this interesting little volume.

THE ARIEL-SIMPLEX 20-H.P. CAR.

THE new 20-h.p. car recently introduced by Ariel Motors, Ltd., and of which a few brief particulars have already been published in the *M.C.J.*, differs from the other cars of the same company in the adoption of a sloping bonnet and in the placing of the radiator at a lower level than usual. This is a reversion to a style which was popular some years ago, and one which is still preferred by many motorists, if only by reason of the greater accessibility of the engine which it affords. In producing the new medium power vehicle, not only has the object of the designer been to reduce the weight to a minimum consistent with maintaining strength and rigidity—the 20-h.p. chassis turns the scale at 17 cwt.—but also to render the vehicle of a simple character by keeping the number of parts as low as possible.

The frame is built up of channel pressed steel braced together by cross members of similar material. The side-members are narrowed in front to give a wide steering lock to the front wheels. At the rear the side-members are curved upwards to allow plenty of play for the rear axle while keeping the centre of gravity low. The engine, which gives 23-h.p. at a speed of 1,300 revolutions per minute, and 22.8-h.p. according to the R.A.C. rating, comprises four cylinders, $3\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in., cast in pairs, and having the valves all operated off a single cam shaft, located, as will be seen from Fig. 1, on the left of the engine, thus leaving ample space for the steering gear and carburettor on the right. The two-to-one gear wheels are enclosed in an oil-tight casing which also serves to support the starting handle and to carry the magneto and water pump; the

As already mentioned, the water circulation is maintained by means of a gear-driven pump and framed ribbed tube type of radiator, the latter being supplemented by a water tank attached to the front side of the dashboard under the bonnet. To assist the cooling of the water the periphery of the flywheel is fitted with vanes to act as a fan in drawing a current of air through the radiator and around the engine. In order to avoid the possibility of a smoky exhaust the lubrication of the engine is effected automatically. A small gear pump driven by skew gearing from the cam-shaft draws oil from a reservoir in the engine base, and delivers it under pressure through a strainer to the three main crank-shaft bearings, and through holes drilled in the crank-shaft to the connecting rods and cylinder walls. A pressure gauge, which, by the way, is the only dashboard attachment, indicates the proper working of the engine lubrication, and a relief valve is provided which is adjusted so that only a sufficient quantity of oil is supplied to the engine at all speeds, and no excess of oil is thrown on to the cylinder walls.

The clutch is of the inverted leather-faced cone type, special springs being fitted under the leather to allow the drive to be taken up very smoothly. No adjustment is provided for the clutch spring, which is adjusted once for all at the factory, but adjustment is provided in the actuating mechanism

for correcting the position of the pedal in the event of the leather wearing in course of time. A double universally jointed shaft connects the clutch with the gear-box, to allow for any want of alignment between the two parts, and to allow either to be dismantled without disturbing the other. The gear-box, which is adapted to give four speeds forward and a reverse, with direct drive on top, is very short and

Fig. 1.—View of Front Part of Chassis of Ariel-Simplex Car, showing new position of radiator.

Fig. 2.—Chassis of Ariel-Simplex 20-h.p. Car.

latter are arranged transversely in front of the engine, being driven by skew gearing off the camshaft. The gravity-fed carburettor is of the automatic type, while the ignition is of the Simms-Bosch high-tension magneto variety. The inlet pipe is brought from the off-side between the tops of the two pairs of cylinders, branching to left and right. Both the inlet and exhaust pipes are held in position by yokes, so that, when necessary, they can be quickly detached.

compact; it is carried on two cross stays of channel section in the same way as the engine. The gear-wheels are specially designed for quiet running, and the sliding members are carried on shafts of the castellated type, ensuring accuracy of the centreing of the gears. It may be added that the reverse pinions are idle on all forward speeds. The change-speed lever is of the fulcrum type and works in a "gate" quadrant. From the gear-box the power is transmitted to a live axle by a cardan

shaft, which has a universal joint at the forward end and a combined telescopic and universal one at the rear. The live axle is of strong design; the weight of the vehicle is supported on the sleeves, the internal rotating shafts transmitting the power to the hubs of the road wheels through dog clutches on their outer ends. The differential gear is of the spur wheel type. The casing enclosing the differential and bevel gearing is jointed horizontally, enabling the latter to be readily inspected. A double tubular torque rod, the forward end of which is anchored universally in a spring box slung from a cross member of the frame, resists the axle torque and relieves the transmission gear and springs from undue starting and braking stresses.

The usual brakes are fitted, one behind the gear-box, actuated by a foot pedal, and one working in drums on each of the hubs of the rear wheels, all being of the internal expanding type. A simple compensating device causes an even action on the rear brakes, while all are provided with easy means of adjustment. The steering gear is of the worm and sector type, adjustable ball joints being provided to the side steering rod. The control of the engine speed is effected by a single lever, working across a fixed quadrant over the steering wheel, and by a small pedal; either the lever or pedal controls the full range of the throttle, so that the foot or hand method of driving may be employed as desired. The time of ignition is fixed for running, but may be slightly retarded for starting only, by means of a small lever situated near the magneto.

Fig. 3.—Plan of Chassis of Ariel-Simplex 20-h.p. Car.

The chassis is supported on long springs—semi-elliptical at the front, and three-quarter elliptical at the rear. The spring shackles are arranged so that they are always in tension, while the shackle bolts are drilled and grooved and fitted with caps for forcing grease into the spring eyes. These greasers cannot come loose through vibration, the screwed base of each being part and parcel of the bolt. The car runs throughout on ball bearings, with the exception of the engine, where white metal is employed. The wheel base of the vehicle is 10 ft. and the track 4 ft. 3 in., while the distance from the dashboard to the rear member of the frame is 8 ft. 4 in., allowing a very roomy body of the closed or open type to be fitted. Altogether the new car is on up-to-date lines, and should prove successful either as a town carriage or touring vehicle.

MECHANICAL noises in one or more cylinders of a petrol engine due to looseness of the moving parts are extremely annoying to a sensitive driver. Faulty lubrication of a piston pin or crank pin, differences in wearing quality of the bearing parts or the slackening of the bearing cap may bring this about, the obvious remedy being the readjustment of the bearings. A loosening of the bolts holding the cylinder to its crank case section may give rise to sounds which add an undesirable accent to what should be the uniform steady purr of the engine's running. Unless the motor is mechanically tight and fit in all its parts smooth action, identical for each cylinder, is not to be expected.

SOME USEFUL NOTES.

USUALLY after the rubber matting on motor-cars has been in use for a time its uniform colour disappears, the oil and grease collecting upon it from boots and by dripping tending to rot and discolour it. To prevent the destruction and discoloration the matting should be painted with lead coloured paint, which when dry gives a varnished surface. Not only is this oilproof, but it gives a bright look to the mat, and renders it easily cleaned by means of a cloth.

REPLACING pistons in their cylinders is sometimes attended with considerable trouble, due to the difficulty of starting the rings into the cylinder bore. If too much force is used the rings may be injured. A turn of fine steel wire should be taken around each ring, and its ends drawn together so tightly that the ring is compressed below the level of the piston surface. After the edge of each ring has entered the cylinder the wire can be clipped off.

AN easy way of replacing valve springs consists of compressing each spring in a vice until short enough to easily go into place and allow the holding key to be inserted, and, when in this compressed condition, tying it with wire so that it cannot expand. After it is put in place and the key is put in the wire is clipped and removed.

If difficulty is found in causing a bolt holding together two parts to fit their holes with ease, the chances are that the two pieces are displaced angularly, and it should not be attempted to put the bolt in place by brute force. The condition should be examined and rectified if found wrong. A great many bolts and studs and their nuts are damaged by carelessness in starting the nuts cross threaded, and then using a wrench forcibly to turn them on. Nuts should be started carefully with the fingers, and one should be certain that the threads "take" properly.

BOLTS are very often spoiled in driving them out from the parts in which they are located. If they do not start readily one is often tempted to use the hammer upon them, with the result that the ends of the threads are frequently burred over. A stick of hard wood, or still better, vulcanised fibre, used between the hammer and the bolt end will prevent damage of this kind.

ABOUT a year ago we gave some particulars of the method of repairing cracked and fractured cylinders and other castings introduced by Messrs. Lea and Son, engineers, Runcorn. At that time the repaired cylinders showed a slightly raised appearance along the position where the fracture had been; we now learn that further improvements have since been introduced, with the result that the work is now absolutely smooth with the remainder of the casting, and that it is practically impossible to locate the repair.

THE taxi-cab has made its appearance in Brighton.

At Brighthouse, Messrs. Hoyle Bros., Ltd., are putting motor-cabs into public service.

THE addition of one or two spoonfuls of olive oil to the reservoirs of paraffin lamps is stated to be beneficial in preventing the lamps from smoking.

MESSRS. PEARSON AND PEARSON, LTD., have been appointed official repairers to the Naval Motor Club, whose garage in Wickham Street, Portsmouth, will be opened towards the close of the month.

A COMPANY has lately been formed in Madrid to establish a service of motor-lorries between Vilcher and Santa Elena for the transport of lead ore and coal from the mines of the Carolina and Navas de Tolosa Companies.

THE export of motor-cars and parts from the United States during January last attained a value of £81,130, as contrasted with only £75,293 in the first month of 1907. The United Kingdom heads the list with £38,960, Mexico being second with £9,519.

THE regulations for what will probably be known as the "Four-Inch" race for the Tourist Trophy are practically concluded. Although the race will not be held until October next, it is the present intention to publish the regulations at the end of this month.

MR. J. A. KUNER, motor engineer, has removed to new premises at Crouch Street and Wellesley Road, Colchester—on the main London road at the entrance to the town. The garage is fitted with an up-to-date plant, and capable of dealing with all kinds of repairs.

THE Kings County Hospital of Brooklyn, U.S.A., has acquired a White steam motor ambulance, consisting of a standard 30-h.p. chassis, with a body similar to those of the ambulances furnished by the White Company to the U.S. War and Navy Departments.

SUPERINTENDENT MARKS, who is said to have secured convictions of motorists which have added over £1,000 to the funds of the Court, has been presented with a timepiece and a purse of gold by the residents of Walton and district, on his promotion to the new division of Woking.

WE understand that the officials of the Thames Conservancy Board are favouring a plan to unload motor spirit from ocean steamers at Purfleet. This has the sanction of the local licensing authorities and of the War Office, and its adoption would be welcomed by the Anglo-American Oil Company.

MR. H. J. MELDRUM has opened a garage on the Manchester Road, Altrincham. This has a floor space of 1,100 square feet and an inspection pit. It is fitted with appliances for all classes of repair work, including tyres. Mr. Meldrum is the district agent for the Riley cars, and keeps a stock of spare parts, &c.

"In my opinion," writes Mr. E. Gordon Learoyd, hon. sec. of the Huddersfield branch of the Yorkshire Automobile Club, which has now 143 members. "motorists ought not to object to a slightly higher tax being placed upon them, but I certainly do think the tax should be devoted towards repairing the roads which are used by the cars."

MR. L. H. STRAKER, the proprietor of the West Bournemouth Motor Company, has opened a garage and motor works on the West Cliff, Poole Hill, Bournemouth. The premises will accommodate between forty and fifty cars, and when completed will have ten private lock-ups. Facilities for washing under cover and generally performing all operations under the best conditions are also provided.

At the usual weekly meeting of the L.C.C. recently, the Fire Brigade committee reported that the De Fornier non-skids obtained for certain motor fire appliances under the authority of the Council had proved satisfactory, and it was desirable that similar non-skids should be obtained for the front wheels of two motor fire escapes in the brigade, and for two spare wheels for motor fire engines. The council agreed that the non-skids should be purchased as recommended.

A MOTOR cycling section of the Legion of Frontiersmen is being formed.

A SALE of motor-cars by auction will be held at Dundee on Tuesday and Wednesday next.

THE North-Eastern Railway

Company intend to run a service of motor-buses during the summer months between Whitley Bay and Blyth.

ON Monday next Sir J. H. A. Macdonald, K.C.B., will read a paper at the meeting of the Royal Scottish Society of Arts at Edinburgh, on "Recent Developments in Power Traction on Roads."

It is reported that motor mail van drivers on the Epping and Bishops Stortford route have been granted permission by the Postmaster-General to be armed with revolvers, owing to the road being lonely and dangerous.

THE interesting standardisation trial of three 9-10-h.p. single-cylinder Cadillac cars, carried out under the observation of the R.A.C., was brought to a successful issue on the Brooklands track on Friday last week. The test consisted of running the vehicles for five-and-twenty miles to prove the evenness of their performances one with another, entirely dismantling the machines, mixing up the parts, withdrawing some, ordering fresh parts to take the place of those withdrawn, reassembling the three cars

The Completion of the Cadillac Standardisation Trial on the Brooklands Track.

with only the use of a spanner, and, finally, running the three vehicles a distance of 500 miles on the track. On re-erection not only did the motors start up on the first turn of the handle, but the trio of cars completed the 500 miles running test at an average speed of 34 miles per hour. The trial is the first of its kind that has been held, and demonstrates to a remarkable degree the thorough standardisation of the components of the Cadillac vehicles.

THE Motor House has secured the new Gilbey Hall, in connection with the Agricultural Hall, London, for the purpose of auction sales on Saturday, the 28th. The cars will be on show for sale by private treaty, and any cars remaining unsold on the last day of the Cordingley Exhibition will be offered by auction. Two special sales will be held at twelve o'clock noon and at six o'clock p.m., on the 28th, and the innovation should prove an attractive feature.

MESSRS. DENNIS BROTHERS have sent us a photograph of a group of three motor ambulance vans which they have recently supplied to the Metropolitan Asylums Board. This is a repeat order from the Board, and makes twelve Dennis vehicles which they have in use at the present time. Messrs. Dennis have also lately delivered a motor lorry to the Bradford Dyers' Association, a motor lorry to the Barnsley Co-operative Society, and a van to Messrs. Lever Brothers, of Port Sunlight.

THE first Weigel six-cylinder 60-h.p. car has been delivered to the Rt. Hon. the Earl of Wilton.

THE Quaker City Motor Club, of Philadelphia, is organising an American motor volunteer corps.

JOSEF HOFFMAN, the well-known pianist, has invented an ingenious road indicating device, which has been patented in Germany.

MESSRS. LESLIE PORTER, LTD., are opening new premises at 22A, Howard Street, Belfast, where they will have garage accommodation for about forty vehicles.

AT Coulsdon, Surrey, Messrs. Thacker and Andrews have a motor repair shop. It is situated on the Brighton road, and the firm will be able to assist motorists in difficulties.

COMMANDER NORMAN, R.N., Cheviot House, Berwick-on-Tweed, is the treasurer of a committee which has been formed to present a motor-car to the Bishop of Newcastle.

THE Great Northern Railway is running special excursions in connection with the Cordingley Motor Show on several days next week, from the leading centres on its lines, including Manchester, Nottingham, Grimsby, Lincoln, Doncaster, Derby, Peterborough, Grantham, Stamford, &c.

WE illustrate herewith a new patent auto ratchet spanner, which has been placed on the market by Messrs. Avery and Roberts, of 64, Stanley Street, Liverpool. This spanner is constructed on the "free wheel" principle, viz., pawl and ratchet internally fitted. Therefore, when the spanner is placed on the nut, it is unnecessary to remove it until the operation of tightening or loosening, as the case may be, is completed, thus saving both. One of the many advantages of the spanner is that it can

be used in confined places, as the slightest movement of the handle is sufficient to either tighten or loosen a nut. Furthermore, as the spanner makes a dead fit on the nuts on all sides, it is impossible to slip or damage them in any way. To meet the requirements of motorists, the tool has been put up in a handy leather case as illustrated. The set comprises a $\frac{1}{4}$ in. ratchet spanner with four adapters, sizes from $\frac{1}{4}$ in. to $\frac{7}{16}$ in., each separately fitting in the spanner, and taking five sizes of nuts. The adapters are also made in French sizes.

MOTOR-CAR instruction is now being provided for prospective Irish motorists at the headquarters of Argyll Motors (Ireland), Ltd., in Chatham Street, Dublin. Mr. R. T. Adams is the lecturer.

THE attention of the Roads Committee of the Bournemouth Town Council having been called to the danger to the traffic caused by certain clumps of trees planted by them in the centre of various roads, have now arranged that these are to be cut and kept down to the level of the neighbouring fences.

THE London and South-Western Railway Company are running several excursions to the Cordingley Motor Show next week, and specially cheap fares have been arranged from Yeovil, Sherborne, Salisbury, Andover, Southampton, Winchester, Bournemouth, and other important centres on their line.

MOTORISTS in the West End desirous of making a trial of benzole in the engines of their cars will be interested to learn that the Petrolie Motor Company, 12, Windmill Road, Chiswick, are keeping a stock of the new fuel in addition, of course, to petrol and accessories. The firm are also in a position to undertake all kinds of motor repairs.

MR. J. M. BOYD is the managing director of the Border Motor and Cycle Company, Ltd., who have a garage and repair works in the Market Square, Galashiels.

A NEW motor garage is being opened in Market Place, Faringdon, Berkshire, by Mr. T. Anna, who will be able to charge accumulators, execute repairs and vulcanise tyres.

BROOKLANDS track will be closed for a few days, so as to get the course into thorough order for the Easter meeting. Mr. Charles Jarrott's attempts to regain the fifty-mile and one-hour record on Friday last week were hampered by a series of tyre troubles.

MR. J. BAXTER has opened premises at 146, Milton Road, Gravesend, where there is accommodation for about thirty vehicles. He has also facilities for the repair of cars. Mr. Baxter was one of the pioneer motorists of the town, and his new enterprise will doubtless be appreciated by those who own cars in the district.

FROM Messrs. Donne and Willans, Ltd., of Gillingham Street, Victoria, S.W., comes a copy of the new catalogue they have just issued of the Piccard-Pictet cars, for which they hold the British agency. The list is not only an artistic production, but gives a very complete description of these Swiss-built vehicles, the main components of the chassis, such as the engine, gear box, and live axle, being illustrated by means of half tone blocks. Four models are being made:—12-16-h.p., 18-24-h.p., and 28-40-h.p. four-cylinder, and 28-40-h.p. six-cylinder. While following the usual lines of live axle cars, there are several interesting features in the details, among which may be mentioned the double set of satellite pinions in the spur differential gear.

WHEN the increasingly popular puncture stop Miraculum was first put on the market it was necessary for motorists to send the tubes of their motor-car or cycle tyres to the depot for treatment. The E. M. Bowden's Patents Syndicate, Ltd., who control the preparation in this country, have, however, now satisfied themselves that this is no longer necessary, and are now supplying Miraculum made up in collapsible tubes, by means of which motor-cyclists can treat the air-tubes of their machines themselves. The tube, which contains sufficient of the compound to properly charge one air-tube, has a nozzle threaded to fit the stem of the air-tube valve, so that the whole operation of charging can be readily done by the purchaser. For the proper charging of the inner tubes of motor-car tyres, a special injector apparatus is required, and arrangements have been made to supply all motor-car dealers and agents with same, so as to enable them to treat tubes upon their premises, thus saving delays to customers. In this case the preparation is made up in tins of various sizes, each containing sufficient for one tube, the quantity ranging from 24 oz. for tyres up to 85 mm., up to 56 oz. for those of 135 mm. to 150 mm.

THE Luna patent steel inspection pits, manufactured by Messrs. F. W. Besant and Co., of Broadstone, Dorset, have since their introduction met with considerable success. The experience gained as to the most suitable style of pit for general purposes has led the firm to bring out an improved form. The new pit is now heavily galvanised both externally and internally after manufacture, while, by a special process, the corrugated side sheets are bent to form the corners, so that no leakage can occur, it being now both water-tight and non-corrodible. While a standard size of 6 ft. long, 3 ft. wide, and 4 ft. deep has been adopted as the most suitable for work under an ordinary car, special sizes can be made to suit requirements. The Luna pit is constructed of heavy corrugated steel at sides and ends, with a steel bottom stiffened with angle irons, and is fitted with two steel steps and a light removable wooden floor, forming in itself a complete inspection pit which can be easily put in the ground by unskilled labour. It is claimed that the reflected light from the internal corrugations enables work to be done underneath the car which would be otherwise impossible without artificial light. One great advantage of the device is that no foundations are required, all that is necessary for erection being to excavate a hole large enough to receive the pit, and to lower it into the hole, afterwards filling in the ground round it.

CONTINENTAL NOTES.

The A.C.F. Grand Prix Race.

Preparations are well in hand for the A.C.F. Grand Prix races on the Dieppe circuit in July next. The plans of the grand stand and car enclosures, to be established at the starting point, which have just been issued, show considerable alteration from last year. The "re-victualling" stations of each of the competitors will this year be directly in front of the grand stand, but located in a long pit in such a way that their sloping roof is only slightly above the track, the latter forming, as it were, a shelf on to which the attendants place any tyres or other articles required by drivers. In front of the grand stand there will be practically two tracks side by side and separated by a railing. If a competitor does not need to stop when completing a circuit he will travel straight along. If he has to halt for any supplies he will run into the re-victualling track. In this way the spectators will have an excellent opportunity of watching every phase of the great race. The Mercedes cars for the contest are already on the road. No details have so far been made public, but it may be said that the vehicles have a speedy appearance. They are driven

The Nice Automobile Week.

The annual automobile meeting at Nice opens on Sunday, the 22nd inst., with a series of flying kilometre speed trials, for which about twenty entries have been received. On the 23rd inst. there will be a "Raid du Printemps"; on the 25th, an appearance competition at Monte Carlo; on the 29th, a flower fete, and on the 31st inst. an automobile paper chase.

The Cannes Automobile Meeting.

An automobile meeting was held at Cannes last week, the first item on the programme being a series of flying kilometre speed trials on the level, the best time (38 1-5 sec.) being made by M. Ragusa on a Darracq. This was followed by a flexibility contest consisting of two runs of 500 metres, one as fast as possible and the other as slow as the car could travel. The first place in this case was taken by an 18-h.p. Peugeot, driven by M. Rouff. On Wednesday, the 11th inst., a brake competition took place, the competitors after travelling a certain distance, and on a given signal, being required to pull up their cars by means of the hand brake. Ragusa, on the Darracq, was the victor in this instance, he bringing his vehicle to a

Touring in Spain.—A Daimler Car outside a Spanish "Venta."

by side chains, while, to keep the centre of gravity low and still use relatively large wheels, the frame curves slightly upwards both front and rear. The exhaust pipes pass out through holes formed on the left side of the engine bonnet. The cars will be driven by Herr W. Poge, Herr C. Lautenschlager, and Herr O. Salzer. The Renault cars will have the same external appearance as those employed last year. The engines will comprise four cylinders, 155 mm. bore by 160 mm. stroke; ignition will be high-tension magneto, and the water circulation, as usual in Renault practice, on the thermo-siphon system.

Motor-Car Regulations in France.

In addition to the provisions with regard to the suspension of licences, referred to elsewhere in the present issue, the new Bill which has been drafted by M. Barthou, the French Minister of Public Works, with regard to the use of motor-cars in France requires every vehicle capable of attaining a speed of nineteen miles per hour to bear an identity plate in front and rear, and these plates are to be fixed in such a manner as to render them immovable, and thus prevent the abuse of changing them. Moreover, after dusk the car will have to be lighted in the rear in such a manner as to make the number appear in luminous characters, so that it may be read as easily as in the daytime.

standstill in 44 ft. In the afternoon a petrol consumption test was held, one litre (1.76 pints) of spirit being served out to each competitor. The longest distance (7½ kilometres) was covered by M. Durand on a 24-h.p. Bayard-Clement.

Motor Racing in Italy.

A series of motor races were held on a 27-kilometre circuit near Verona, on Sunday last. In the 110 mm. bore four-cylinder section the winner was Franchini, on a Bianchi (time 20 min. 23 sec.). Selvatico, on an Itala, won the 120 mm. bore class in 19 min. 51 sec.; and Muzio, on a Junior, the 130 mm. category in 16 min. 32 sec. During the race two cars collided, but without serious damage, while Piccoli, on a Spa, ran into a wall at one of the sharp turns.

Miscellaneous Items.

The French Post and Telegraph Authorities are about to invite tenders for the conveyance of the mails between Le Mans and St. Calais (Sarthe) by motor vehicles.—A scheme to construct a motor-track, 9½ miles round, in the neighbourhood of Spa, Belgium, is under consideration.—A service of motor-cabs is being started in Wiesbaden, Germany. The vehicles are of the Opel 8-14-h.p. type.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

ENGINE RACING THROUGH ROAD SLIP.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed several articles and paragraphs stating the engine of a motor-car "races" through the wheels leaping off the ground on rough roads at high speeds. With a view to settling this point definitely I had some interesting experiments carried out at Brooklands recently. The results obtained seem to rather dispose of the idea that the engine "races." At any rate in the six-cylinder Napier car, with its steady, even drive, system of springing and road equalisers, both back wheels do not, apparently, leave the ground together.

With regard to the question of the part played by the springing of the car, this is rather an important point, because some have suggested that it was impossible to construct a car with a transverse spring at the back, with the luxury and comfort that accompany this, without having the serious drawback of the wheels not holding the ground. The results definitely show that this luxury can be, and is, obtained in the Napier car without this drawback. It is very comforting to the ordinary user

be seen, the engine made only seventy more revolutions in a complete lap at sixty miles an hour than it did when being towed. This, of course, is practically almost a negligible quantity.

It is evident from this, first, that on a six-cylinder Napier, at high speeds, or over rough grounds, the back wheels do not both leave the ground together, otherwise this would be shown by a greatly increased number of engine revolutions over this fixed distance. One cannot, however, believe that at mile-a-minute speeds one or other of the back wheels do not at times jump off the ground, because even with the scientifically designed Brooklands track there must be some places in it where the curves of the banking do not absolutely synchronise with the speed of the car, and therefore, at these points, one wheel at a time must leave the ground. Evidently, the differential gear looks after this variation of wheel speed.

The next test to be carried out will be to fix a registering device to each of the four wheels, and then find out exactly how much each wheel varies in relation to the others. The present tests, although they do

The Old and New Style of Omnibus in Paris.

[La Locomotion Automobile.

to know this, as it means to him not only more comfort, but a decrease in his tyre bill, as any form of "racing," or unequal drive, means an early decease to the tyre, and grist to the tyre maker's mill.

The test was carried out as follows:—The top gear was engaged, and the car was then towed a complete lap at Brooklands, or a distance of approximately 2.5-3 miles, and the number of revolutions of the engine was found to be 3,732. The car followed the 50 ft. line of the track, and throughout the whole test kept as near as possible to the same line. The car was then driven at varying speeds, as given in the tabulated list:—

| Test. | Distance (about 2.5-3 miles) | Speed in m.p.h. | Engine (in engine revs.) | Total slip (revs.) |
|--------|---------------------------------|--------------------|--------------------------------|-----------------------|
| 1. ... | 1 lap 2.5-3 miles | car towed | 3,732 | — |
| 2. ... | " | driven very slow | 3,748 | 16 |
| 3. ... | " | driven 20 m.p.h. | 3,776 | 44 |
| 4. ... | " | driven 30 m.p.h. | 3,772 | 40 |
| 5. ... | " | driven 40 m.p.h. | 3,770 | 38 |
| 6. ... | " | driven 50 m.p.h. | 3,780 | 58 |
| 7. ... | " | driven 60 m.p.h. | 3,804 | 72 |

This list gives a speed up to sixty miles an hour, and, as will

not apparently show us very much, are really exceedingly satisfactory, as showing how the designer of a motor-car, by getting the correct design, helps to eliminate tyre wear.—Yours truly,

S. F. EDGE.

A SPEED LIMIT SUGGESTION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an ardent believer in motor-cars, I think that some move should be made either by the Motor Union or the District Councils with regard to the pace of motor-vehicles through the towns, not from a danger view-point, but in order to prevent people (ladies especially) getting their clothes spoilt. During recent wet weather a motor-car going at any pace covers everything with mud on both sides of the road, and I am sorry to say there are some drivers who seem to think it a joke, and just sit back and smile.

It is this ungentlemanly conduct that gives cause of complaint, and in order to overcome or lessen the nuisance I would suggest that at every town before and after where the danger posts are or should be, that each sign should have in the centre 6 or 5 m.p.h. according to the width and danger of the road, and the pace set by the danger post would stand till the one out of the town had been passed. The speed limit

has been so often proved an absurdity that I would do away with it, except where marked on the posts and at the roads and cross-roads. There are many places where fifty miles an hour is not so dangerous to either public or drivers as twenty miles an hour in other places. Automobiles have come to stay, and the sooner the authorities realise it and have their roads properly marked the better for all parties.—Yours truly,

T. W. HANMER.

ECONOMY IN CHAINS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had a sprocket wheel cut for my car. It has the same number of teeth, but on a sprocket $\frac{1}{2}$ in. larger, so that each tooth is as far apart as the links of a worm chain. I can now put the worm chain on one sprocket, the new one on the other, and so save about half the cost of chains. The old chains run just as well as new ones.—Yours truly,

ERNEST ESTCOURT.

STEAM CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in your number of March 14th a letter signed by Mr. Chapman giving advice and his experiences with steam cars to another correspondent, viz., "Amateur." Now, nothing is further from my mind than to lay down the law as to which is the best; personally I prefer petrol, but that is only a matter of opinion. But what I do want to point out is that the picture which Mr. Chapman draws of the petrol car and driver in traffic is, though of course partly possible, so exaggerated as to be of no earthly use as a comparison. The man Mr. Chapman describes, unless it be his first attempt to drive a car, should not be in charge of any make of self-propelled vehicle, steam or petrol, as he would be a curse, and probably a danger, to the public, as well as a nuisance to himself and any unfortunate being who happened to be in the car with him. Finally, I should like to point out that in this amusing little picture of the petrol car and driver an obvious lack of knowledge is apparent. Mr. Chapman says: "When he (the petrol driver) stopped he was probably on top speed, waiting his opportunity with his clutch depressed; now he endeavours to move, one, two, his engine has stopped, he hears some gibes, he jumps out to start up again. One, two, stop, bang, he is nearly run over by his car, having left his gear in. A mad rush for the lever, a cab has drawn close up to the off-side. Another mad rush to the other side and in the car, puts the lever to neutral. Once more to the handle and the engine starts (perhaps). Up he jumps again while the cabby whistles 'Home, Sweet Home'; first speed now, carefully, two or three pops, and the engine stops again. Alas! he has left the brake on."

Now, firstly we will presume that the car is one in which the act of putting on the side brake automatically withdraws the clutch; well, what happens? According to Mr. Chapman, after many trials the driver is ready to proceed, he carefully puts in the first speed, then he stops his engine by letting in his clutch with the brake on; but this is impossible, as the act of putting on the brake in the first place put out the clutch, and this cannot be let in unless the brake is first taken off.

Secondly, we will say that the brake and clutch are not connected in any way. What have we then? An apparent Hercules, who is not only able to turn the starting handle against the compression of the engine, but also by the same movement to propel the car forward, as the clutch is engaged and the top speed in; and, lastly, to do this despite the retarding effect of the brake, which I presume is not an absolutely negligible quantity, as Mr. Chapman makes it stop the engine. I merely point these errors out in order that the uninitiated may not be led into thinking the petrol motor such a weird and complicated thing as Mr. Chapman's letter would seem to make it.—Yours truly,

L. ASPINALL.

TO THE EDITOR OF *The Motor-Car Journal*

SIR,—Your correspondent who signs himself "Locomobile" says he has used one of "these" little cars for a long time. It seems to me he implies, of course unintentionally, that all steam cars are Locomobiles. Further on he adds that the prejudice that has so long existed is due more to ignorance and mismanagement than anything else. Quite right! But I feel inclined to add the vehicle he names, for, although there were some good little cars of this make, I have no hesitation in saying that they were originally responsible for the prejudice that still exists against the steam car. There is no doubt, however, that the little Locomobile, if properly looked after, will be running when some of the petrol cars of its age will be on the scrap heap. I would like to point out for the benefit of the uninitiated, that the spares or spare parts usually carried on a steamer are very few and very light, because there is no necessity to take a lot of stuff about on the car. Even if one does have some little troubles on the road, they are very rare, and I have never known an instance of its happening that one cannot get home. One other thing I would like to point out, there are plenty of motor schools and firms who profess to teach motoring, and they do so, but I do not know of any firm, and up till now I have not heard of any school, where a knowledge of the steam car may be attained; and I believe that after the vendor has completed with his customer, the latter is left almost

entirely to his own resources, there being, I believe, no manuals or such-like issued to help him.—Yours truly,

HERBERT J. CHAPMAN.

- THE AUTO TYRE INFLATOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent "Philistine," re Maxfield's Auto Tyre Inflator, in your issue of the 14th inst., the speed of the inflator is governed by the operator, the friction wheel being designed so that the pump rotates, with ignition of engine retarded, at about 1,000 revolutions per minute. Tests have been conducted with speeds varying from 500 revolutions to 5,000 revolutions per minute, and flywheel diameters varying from twelve to twenty-four inches, with most satisfactory results.

Re ball valves closing at the high speeds mentioned, the writer some seven months ago conducted a number of tests of the inflator at various firms throughout the country, and at a demonstration in Coventry tests were conducted with a car the flywheel of which measured twenty-four inches diameter, tyres 880 by 125, inflated to a pressure of 90 lbs. per square inch. First test—Engine ignition fully retarded, time four minutes; second test—Engine running normal speed, same pressure and tyre, time two and a quarter minutes. This is a convincing test as to speed and results. A large number of these pumps have been sold with satisfactory results. The valve V is the intake valve, the air entering through the parts shown by dotted lines.—Yours truly,

A. J. B. MAXFIELD.

The 40-h.p. Motor Lorry recently supplied by the Mandalay Motor Company, Ltd., to the War Office.

This vehicle is designed to carry three tons of goods, and it will be used principally for the transport of foodstuffs for the men and fodder for the animals.

THE 2,000 MILES RELIABILITY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have read the articles in your paper with regard to the above trials with great interest, especially with reference to the unfair conditions which would apply to small cars. To fix the daily distance for cars of 6-h.p. or 8-h.p. to be the same as cars up to 60-h.p. seems to be unreasonable. It is more like expecting a pony to do the same amount of work as a cart-horse; one has a hard task and the other a mere pleasure jaunt in comparison, and one has to be straining its sinews all the time while the other is trundling along with the throttle only slightly open. We think the better plan would have been to arrange a longer route for the larger cars daily and a shorter route for the small ones, so as to bring the work almost equal in the same way that the distances were varied in the Commercial Vehicle Trial.

The same thing applies to the race at Brooklands track. Imagine a small car covering 200 miles on that track and the high power cars doing their distance at the same time; then again the case of entrance fees, the number of the small cars which would have to be sold to recoup for the expense of the trials, having regard to the comparatively small profits on them, is all against the small cars. To the distance as a trial we do not object, because if the motor is not capable of running 2,000 miles in the hands of a competent driver it is not fit to sell to an ordinary customer, although, as everyone who has experience of trials knows, there is a great element of luck in these matters, because a mishap such as happened to Miss Levitt in the very last stage of the Hereford trials in 1904 may occur, which may not happen again in twenty years' running.

We certainly think the matter of total disqualification of the car in case it stopped on a hill and had to turn the passengers out is unfair, as the driver, on account of over anxiety, may give the engine excess of lubricating oil before the hill-climb, which might cause difficulty with the plugs and consequent mis-firing. For other matters we think the rules should be made more elastic.

For the above reasons we have decided to enter a Clyde car for the Scottish trials only, as we think that the conditions to be filled in this trial are sufficient to test any car, especially as it includes the hardest part of the 2,000 miles run.—Yours truly,

G. H. WAIT.

TAXATION OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In my opinion the tax should not be increased for any car, large or small, any more than it is at the present time; but, if the authorities are determined to make motorists pay an increase on their already high tax, I consider it ought to go towards the County Councils for the repair of roads.

This, perhaps, might lessen the objectionable fines levied on the victims to police traps, which, I am told, help to relieve the rates of the parishes where the fines are paid. If the authorities still persist in levying fines and heavy taxes from the motorists, they will do more to stop and put down one of the most thriving trades in Great Britain, and surely in these bad times trade ought to be encouraged and not thwarted as this motor trade seems to be.—Yours truly,

OSWALD MOSLEY.

Facsimile of the Cheque paid to Mr. Staples Firth by the East Sussex Constabulary.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been reading with interest the number of views taken by your correspondents on what should be the proper taxation under the new Act. I hope you will let me give my opinion on same, having been a motorist since the very commencement.

As far as I can see, the idea of a further taxation on motor-cars is in order to compensate the damage done to the roads by the motor-car. If this is so, surely the taxes ought to be put on to those who use studded tyres. My experience over a great many years' motoring tells me that a car fitted with plain treads does not do very much harm to the surface of the roads, but what causes the mischief is the studded tyres, and this is entirely responsible for the cutting up of the roads, and causing the enormous amount of dust in the summer time.

If the cars were taxed according to the number of studded tyres they had on the car, this would go a very great way towards defraying the expenses on the upkeep of the roads, which is undoubtedly caused more through the tyre than through the weight of the car or anything else.—Yours truly,

W. G. WINDHAM (Capt.)

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am a country medical man of very limited means. The practice is a scattered one, the country extremely hilly, the roads bad. Three years' experience of light, high-grade, single-cylinder cars proved that they would not long stand the heavy work and they rapidly wore out.

I now use a 12-h.p. two-cylinder car weighing nearly 25 cwt. My means being limited, I was obliged to purchase a car which many people would consider out of date. It is four years old at least, cost originally £600, and was bought by me for less than £100. It is heavy, not very fast, but most reliable.

If cars are to be taxed by weight I must pay considerably more than my neighbour who uses a 40-h.p. two-seated racing car capable of enormous speed, using steel studded tyres, and costing him ten times as much as I could afford to pay. His car, owing to its speed, must cause far greater damage to road surface than my car. Why should people who can only afford to use obsolete, heavy, slow cars (such as a 6-h.p. Daimler or 10-h.p. Benz) pay more than people using modern light high-powered cars? Why should people who can only afford to buy second-hand cars pay as much as the people who buy new cars of similar quality?

Could not cars be taxed according to market value or on the sum

actually paid for their cars when bought, a liberal allowance year by year being made for depreciation?

I look after and drive my car myself; my neighbour owning the high-powered racer can afford to pay a skilled driver and a very heavy tyre bill—yet he will pay a smaller tax than I do if cars are taxed by weight!

Why not put a duty on each tyre sold. The tyre bill is the heaviest expense of motoring, and the man who can afford the largest tyre bill is the man who can best afford to pay the tax. Tyre makers are no numerous, and the duty could be levied on the maker, who could have a customs stamp branded on each tyre sold.—Yours truly,

HEAVYWEIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Personally I am strongly against any further taxation on cars. My income is strictly moderate, and it is only by exercising extreme care, and by doing what repairs I can myself, that I am able to run a car at all. I feel sure there are many in similar circumstances, and any increased taxation will entail the cars being given up. We must do some good in circulating money while away from home, if it is only for tea during a Saturday afternoon drive. If more money is needed, why not tax yachts and steam launches, and any other form of expensive pleasure which now goes free? Then, again, a small tax on bicycles would bring in a considerable amount.

I know it may be said the poor man's carriage should not be taxed, but the use of a bicycle enables him to live in the country in many cases, where rents and food are cheaper. At present the working-man seems to gain everything and give nothing. How would it be for the Motor Union or local clubs to make a postal vote of their members, or get a petition signed by them against increased taxation, for presentation to the Chancellor of the Exchequer? It certainly does not seem desirable that a young and growing industry should be throttled or taxed out of existence, and it behoves all motorists to stir themselves up before it is too late. What tax does a four-in-hand pay? If we are to be taxed by weight or horse power, why not that also?—Yours truly,

W. H. B. (Wilts.)

PRACTICAL EXPERIENCES OF MOTOR-BUS DRIVING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Before being entrusted with a 'bus every man in our service has a month's tuition in the shops, thus getting an idea of the construction and also repairs and adjustments. Some of our best drivers to-day were three or four years ago driving horse 'buses; they have become so used to motors that they have almost forgotten how to handle the reins.

After a new driver has put his "bill" at Scotland Yard, and the blue badge that he wears, he is put out with an older hand and has a lesson in driving under ordinary service conditions. The time varies according to his quickness in getting used to the vehicle and route, generally about three weeks is the length of time of this driving lesson. After he has driven a 'bus and shown his ability to change gear, reverse, &c., he is given a regular vehicle of his own.

Our company have given preference to the old horse 'bus hands, and in eight cases out of ten these men have got used to motors and their management. The exceptions are the unmechanical, the men who cannot be grafted into handling tools, &c. For instance, we had one man who, after being out for a month with the drivers, was given a trial. He quickly picked up the steering, but had not the remotest idea of gear changing or working the clutch. Well, the first day he was entrusted with a 'bus he had not done half the first run before he tried to change gear with the clutch in! It stripped the differential and gear, and after that he was given up as a bad job.

Suffragettes remind me of a very unusual form of breakdown that occurred on one of our 'buses over three years ago, when they were hardly out of the experimental stage. On this vehicle the cardan became loose and one end went clean through the floor boards. There were four passengers inside (ladies) who did not seem to be put out at the occurrence. They asked: "Has there been a breakdown?" as though the floor was a matter of course. The driver and his mate could not help laughing, though it was no laughing matter. The ladies were not the least flurried, although the floor of the 'bus looked as if it had been through an earthquake.

Whilst Brooklands racing finds out any weak spot in design, lubrication, &c., I think it is admitted that public running conditions, such as a London 'bus undergoes, is equally severe a test. Take lubrication alone. All systems, automatic pressure and mechanical, are tested, but our engineers long ago found by experience that extra hand or pump lubrication to the engine was essential. They found this out years before drivers of racing cars at Brooklands did.

Coming to carburation, more is learnt by motor-buses than a dozen T.T. races, for every form of carburation is tested on its merits, and you may be sure that any really improved carburettor or economical device is tested on a 'bus pretty soon after it is known. As regards ignition, a great deal has been learnt from the motor-bus. I believe the splendid results we got with the low-tension magneto only on the old Milnes-Daimlers years ago was responsible as much as anything for the magneto now being universal. The old M.-D.'s did wonders in ignition trials, and remember they were run under the most trying conditions, and the magnetos were exposed to the oil flying about. In my opinion two magnetos for slow and high speeds is the ignition of the future.

A loss of power on one of our engines was due to an unusual cause, and the engine being new (it had not run three weeks) it puzzled the mechanics. On test it was seen that the compression of the third cylinder was bad, it was blowing very badly as though the rings were a poor fit, so the cylinder was removed, and then a crack (barely half an inch long) was seen on the piston head, and examination made it clear that a flaw in the casting was the cause.

In changing speed on a rising road, and when the engine speed has decreased, it is no easy matter to change gear without something of a jerk, no matter how quickly it be done, and unless the clutch is in good condition it is an impossibility. I have seen some stripped gears and differentials in some of the newer 'buses running, and in my opinion the driver was not altogether to blame. One of the worst stripped bevels I ever saw was on a vehicle with a metal-to-metal clutch, which, although it may give good results if properly adjusted and lubricated, will cause trouble if these things are not attended to. From what I have seen, stripped gears and pinions occur more on gear-driven than on chain-driven cars, for the reason that the gear drive is more positive, hence bevels are put to a sharper and more severe strain when the clutch is let in or in gear changing.

Sometimes one reads in the motor papers about instances of bad driving of motor-buses, the fact being ignored that generally it is not the driver's fault. I would like to see any of these writers on a motor-bus under some of the trying conditions we get. They would quickly see it is far from pleasure driving, especially when, as sometimes happens, the clutch is a bit fierce (or the other way about), a gear or two does not engage as it ought, and a knock somewhere in the engine that causes a headache to a sensitive driver, and as likely as not streets so slippery that you are not quite certain whether the next second the bus will try and

THE INTERNATIONAL TOURING CAR TRIAL.

THE suggestion has been approved by the full Trial Committee that Class 2, which corresponds to Standard No. 2 of the table of Touring Car Standards (6.4 to 13.0-h.p. by R.A.C. rating), should be divided, the divisions to be known as Class 2a and Class 2b.

Some alterations have been made in the "Supplementary Regulations" issued on February 5th, 1908, which should be carefully studied by competitors. Standard No. 2 is to be sub-divided as follows:—

Class 2, (a) Engine rating between 6.4 and 9.4-h.p., seating capacity two persons, weight all complete, &c., not less than 15 cwt.

Class 2, (b) Engine rating between 9.4 and 13.0-h.p. seating capacity two persons, weight all complete, etc., not less than 17 cwt.

Regulation No. 10.—For "Class 2," read "Class 2, (a) and (b)."

Regulation No. 15.—At end of first paragraph add: "Provided that if a vehicle fail to carry its full complement of passengers along any part of the course other than a timed hill climb, the car shall on the occasion of each such failure be penalised ten minutes in respect of each passenger alighting. The car shall not complete the stage until any passenger so alighting has resumed his seat, and such passenger in the interim shall proceed along the course on foot. This penalty shall not be reckoned in determining the car's actual maximum or minimum time for the stage, but shall be debited against the car at the end of the day."

COMPANY NEWS.

FORDER MOTORS, LTD.—Registered with capital £100, in sixpenny shares, to acquire the freehold and leasehold properties in Wolver-

An Argyl Char-a-banc at Gourick.

turn round and face the direction from which you have just come. In my opinion every R.A.C. trial, such as an engine non-stop, should include a few hours' London traffic driving, then the drivers would get some idea of the work a London bus and driver have to do every day in the week.

I will conclude with a few things every driver should remember. Engine firing after switching off or throttling down is generally caused by carbon deposits on cylinder. Popping in carburettor is due to either the valve sticking in guide, a bent valve, or (if with automatic inlet valves), weak inlet spring. Gradual slowing of engine may be due to choked petrol pipe or carburettor, no pressure to petrol feed, or feed giving out. Overheating results from either the water circulation or pumps not working properly, poor compression (through rings, plugs, or valves), not properly lubricated, or poor quality oil. Backfires in silencer arise because of faulty ignition; see to magneto plugs and terminals. If low-tension magneto, clean accumulator and brushes.—Yours truly,

A MOTOR-BUS DRIVER.

LOST GLOVE.—A motor glove of some value picked up in Weston-super-Mare on the 3rd inst. is in the possession of the Superintendent of Police, who wishes to find the owner.

A STEPNEY wheel, size 880 by 120, fitted with new Dunlop ribbed cover and inner tube, number of wheel 27811, has been lost in London, and information will be welcomed by Lt. Hon. W. S. Leveson-Gower, H.M.S. Coquette, Portsmouth, or Messrs. Rose and Co., Southsea.

FROM Mr. C. D. Fennell we have received a copy of his letter of protest addressed to the Motor Union of Western India in connection with the decision come to as to the awards in class 4. Apparently in this competition there were many breaches of the rules, and Mr. Fennell suggests that the trials should be run over again.

hampton known as Forder's Royal Hansom and Carriage Manufactory and to carry on the business of manufacturers of and dealers in motor cabs, cars, omnibuses, &c. Registered office, Ardmore, Eynsford.

DEFIANCE MOTORS, LTD.—Registered with capital £100, to adopt an agreement with the Laystall Motor Engineering Works, Ltd., F. T. Bersey and S. C. Eade. Registered office, 27-9, Laystall Street, Rosebery Avenue, E.C.

PADDON AND SOPWITH.—The directors recommended a final dividend of 35 per cent., free of income tax, on the ordinary shares, making 42½ per cent. for the year, and a dividend of 20½ per cent. on the deferred shares of the company.

ROAD REPORTS.

OCKHAM.—A measured quarter of a mile is being worked by the police at Ockham.

CHESHIRE.—At Wilmslow, an Alderley motorist has been summoned for having no rear lights showing on his motor-car. He complained of the roads, and said he had passed over a length between Handford and Wilmslow which was bad enough to shake any lamp out. A small fine was imposed.

SUSSEX.—Among the roads under repair are those between Bolney and Ansty, Rottingdean and Brighton, Lewes and Ringmer, and Frant and Tunbridge Wells.

ISLE OF WIGHT.—The Isle of Wight Motor Association is warning motorists visiting the island that many of the roads on the island are particularly narrow and winding, requiring special care being taken.

SUBSTANTIAL reductions are notified in the new catalogue of the Dunlop Pneumatic Tyre Company, Ltd.

THE CARBURETTOR AND ITS FUNCTIONS.*

(Continued from page 58.)

The float point should be easily ground so that it may be kept tight and in perfect working order. Further, the motion of the vehicle should tend to move the float point to some degree, even though slight, which movement serves to force away any particles of dirt that may lodge on the point during the passage of liquid. On this account it is best if the float and point are fixed one to the other, so that the point partakes of the motion of the float and liquid in the chamber. The petrol should enter the float chamber from a single direction, either up or down, so that no pockets exist in which water or dirt may gather. It is best to feed the chamber by gravity from a tank above the float chamber and with downwardly extending pipe, without pockets, leading into the chamber near the top, with float point upward, such point being attached directly to the float without levers, weights or other unnecessary parts. The float chamber should open at the bottom for automobile use. This facilitates removal of any water, ice, or dirt, and removal of float itself, without opening the top and permitting dirt to fall in from above. The float and removable bottom can be replaced with a stream of petrol flowing upon them, which will wash away particles of dirt, if any accidentally get on the parts while being replaced. With top opening, ice in the bottom of the chamber may not only support the float and prevent its falling to admit petrol, but may also bind the float so firmly that it cannot be removed to permit removal of ice, which may prove an unpleasant predicament it away from means of warming the mixer. The float chamber should have an air vent to permit proper action, and this vent should preferably terminate above the petrol tank, so that if for any reason

His Majesty the King of Spain is a firm believer in the Stepney Wheel, and never travels without it. The above illustration shows two of His Majesty's Daimler Cars with the ever-ready Stepney by their sides.

the float fails in its duty the petrol rising in the vent tube will not rise higher than the tank level, and so cannot escape. Where convenient, the "ticker," or device for depressing the float and flooding the mixer, should pass down this vent tube. This arrangement, in connection with a needle that closes the nozzle when the motor is stopped, prevents danger from leaking petrol, and possibly fire. It is more reliable than a tap, for the operator will grow careless about the latter, but will, if needed, adjust the nozzle daily to secure best results under prevailing weather conditions for that day.

EQUALISATION OF FUEL FLOW INTO THE MIXER.

All petrol entering the mixer should be strained through ample gauze, so that particles likely to clog the nozzle may be kept from entering. Such gauzes are usually provided at the opening of the tank or in the funnel; but this is not sufficiently certain for the best results, and the perfect mixer should be self-protected from this certain cause of trouble. The outlet from the float chamber, usually termed the jet, should be nearly concentric with the chamber. If centrally located, variations in angle do not affect the level at this point; but it is some advantage to have this point slightly behind the centre, so that going up hill or accelerating the action of the vehicle automatically raises the level of the liquid, and thus slightly increases the flow, making the mixture slightly more fat and powerful. This arrangement permits the normal mixture to be lean, insures perfect combustion, great economy, and no odour, yet automatically brings the mixture to maximum fatness and power when power is needed.

Since liquid has considerable weight, and consequent inertia, the passage to the nozzle should be both short and large, for large passages

do not clog easily, and, if short, the liquid can flow quickly, and will likewise cease flowing without delay when the suction ceases. If large, the friction is less and no particle of liquid need acquire high momentum. If, on the other hand, this passage is long, the liquid does not get started until a large volume of air has passed the nozzle, making the early part of the charge too lean, while, as the suction decreases and the air flow ceases, the inertia of the liquid causes it to continue to flow, making the latter portion of the charge overfat, and leaves between charges probably unsprayed drops of liquid, which fall upon the walls or are drawn into the motor.

UNSPRAYED LIQUID SHOULD NOT BE ALLOWED TO WASTE.

Such liquid as remains in the passage unsprayed should be retained, and not permitted to run into the motor or upon the ground. This liquid should also, by the shape of the passage or by other suitable means provided, be broken up, sprayed or finally divided at the next suction stroke, so that it may properly serve its purpose within the engine. If, because of a faulty float, the nozzle should flood, the air passage should not fill with petrol, for, when attempting to start the engine, this would result in a large volume of liquid being drawn into the cylinder, making its contents too fat to ignite. To prevent such flooding, the air passage should have an opening at a proper distance above the bottom to permit the escape of excess liquid, in case such exists.

The nozzle should be closed from above by an adjustable needle, for the inverted conical point of such a needle assists in making a fine spray. This needle-adjusting handle should terminate near the driver, and permit him, while operating the vehicle, to vary the proportion of the mixture, and thus secure the greatest power by trial, as well as accommodate the device to the temperature and humidity of different days, and also to the gravity and composition of different fuels. No adjustment while the vehicle is standing can compare with adjustments in actual road service in point of accuracy. Further, the mixer should be adjustable at low speeds, to secure certain ignition and steady running. Gas engines are particularly prone to misfire at their limits, and the perfect mixing device for motor vehicles will provide superior conditions at these limits in order to secure the most satisfactory range of service. This necessitates provision also for adjustment at normal or high speeds, and by inference the device should automatically compensate at intermediate speeds. Most present-day devices are adjustable for one speed only, and depend for automatic adjustment upon considerable variation in the suction vacuum, and so cannot give good results at widely varied speeds from that to which they are adjusted. This defect need not, and most certainly should not, exist.

That the largest possible charges may be drawn into the motor at high speeds, it is self-evident no needless friction should be caused the air as it passes toward the engine. On this account a single air passage is better than several, because there is less wall surface and friction. It is also evident that the air passage should be easy, and not tortuous or broken. It is undoubtedly true that the tortuous passage will break up the particles of petrol and help to form a homogeneous mixture, but this is done at the cost of increased suction and of some loss of volume and consequent needless loss of power from the motor, particularly at high speed.

PROTECTIVE GAUZZES AND THEIR FREQUENT CLEANSING.

Since some engines may occasionally backfire through their inlet valves, the mixer should be provided with escape for explosion, for if this is not done the pressure may force into the float chamber and will more certainly interfere with the next succeeding charges than if allowed to escape into the atmosphere freely and promptly. To prevent such explosions from igniting anything on the outside, the pipe entrance should be provided with a gauze strainer, which mainly serves to keep out particles of dirt that otherwise would enter the engine and likely stick to the walls and cause rapid wear and pre-ignition. Much of the carbon deposit so common in automobile engines is caused by road dust, with enough oil to bind it together.

The rapid evaporation of the liquid not only takes heat from the passages in which the evaporation takes place, but frequently causes a deposit of moisture, which in the presence of low atmospheric temperature becomes ice and clogs the passage. This freezing may be prevented and a more perfect evaporation, with consequent intimate mixture, secured by heating the passage where the mixture is taking place. I therefore favour a heating jacket outside the mixture passage, through which hot gas from the exhaust or hot water from the circulating system may flow, and I consider it advisable to place within the mixture passage at this point one or more gauzes of large area to positively intercept large particles of liquid and prevent their being carried into the cylinder. All gauzes should be removable for cleaning purposes, and frequent attention to the various details of this most necessary part of the vehicle is necessary to insure perfect work.

(To be concluded.)

THE alterations at Messrs. R. M. Wright and Co.'s garage at Lincoln enable at least fifty cars to be garaged, besides the repair cars.

THE West End show-rooms of the Acetylene Illuminating Company, Ltd., of 268-270, South Lambeth Road, S.W., are at 20, Long Acre, W.C. The carbide is now supplied in 1 lb. enamelled tins as well as in larger quantities.

*Abstract of Paper read by Mr. C. E. Duryea before the American Society of Motor Engineers, Buffalo, N.Y.

THE NEW HUMBER WORKS AT COVENTRY.

CONSIDERABLE excitement prevailed in Coventry on Thursday, last week, when a fleet of thirty Humber cars lined up at the station to convey a large party of representatives of the Press to inspect the immense new works which have been established by Messrs. Humber, Ltd., just outside the City of Spire. The business of the company has so increased within recent years that factory after factory has been acquired until the manufacture of Coventry-Humber cars and cycles was spread over six or seven separate works, naturally adding greatly to the difficulties of management. It was to bring the whole of the operations under, as it were, one roof, and to provide for further expansion, that the establishment of the new plant was decided upon.

Within the space at disposal it is impossible to fully describe the new works, but some idea of their enormous extent may be gathered from the fact that the buildings alone cover 13½ acres, that employment is given to 5,000 hands, and that the productive capacity is equal to 150 motor-cars and 1,500 bicycles per week. The works have been built under the personal supervision of Mr. Walter Phillips, who has been the Coventry manager of the company for sixteen years, and who has brought to bear on the building and equipment a unique knowledge of the peculiar requirements.

The works have been erected for an annual output of upwards of 75,000 cycles and 7,500 motor vehicles, and for the most part consist of

plant and machines are carried on, and the engine, back axle, and gear-box fitting shop. The latter covers 21,600 superficial feet and employs about 300 hands. At one end of this shop are the stores of finished machine work, which have been received direct from the examiners, whence the fitters receive the hundreds of parts which are required to build an engine, gear-box, or axle, according to which section the fitter belongs.

Especial interest was taken in the engine test shop (100 ft. by 40 ft.) where seventy hands are engaged on engine testing alone. Instead of using the old method of testing with a rope round the fly-wheel, the use of the water dynamometer, which does away with all unpleasant smell, smoke, and grease, has been adopted. The chassis erecting shop covers no less than 22,000 superficial feet, and as one sees the never-ending rows of frames gradually evolving into cars, one cannot but express astonishment at the large scale of the undertaking. Following in close order come the car frame erecting shop, the brazing department, the riveting shop, the polishing room (area, 15,400 feet), the plating section, the coppersmiths' shop, the radiator and sheet metal department, and the hardening shop. Another interesting department passed through is that devoted to experiments, where a careful examination is carried out of all patents that are granted upon matters relating to motors and cycles.

The body-building portion of the works also calls for mention. It begins with the timber-seasoning stores, standing on an area of 15,000 ft., where something like 2,500 tons of the best brands of timber are stored. Saw mills adjoin the stores. The body-making shop covers a superficial area of 36,000 sq. ft., and finds employment for no less than 350 hands. The upholsterers', painting, and varnishing departments are on an

The Lunch at the Opening of Messrs. Humber, Ltd.'s New Works at Coventry. Three Interior Views of the Works are given in the small round illustrations above.

single-storey buildings, designed to give the greatest efficiency in production, combined with low cost of manufacture and comfort for the employees. The buildings are built entirely of substantial red brick, and have glass and slated roofs, northern light, and several shops have lantern roofs. The floors are all cemented, on a bed of concrete; but in certain shops, for the purpose of particular work, wood and tiled surfaces are provided over the concrete. Surrounding the main portion of the works are roads 30 ft. wide, intersected with 20 ft. roads, with a dust-proof finish, by Tarmac, Ltd.

The offices, which are two storeys in height, are entered by a main central hall, having a wide central staircase, with side staircases leading off from right and left into a balcony corridor running round the central hall. A most elaborate and yet simplified telephone system, whereby easy communication is made with all sections of the works and trunk lines, has been installed. Leading from the main hall we come to the car-examining and despatch department, with 18,000 square feet superficial area. Here the newly-finished cars wait to undergo their final examination before taking the road or being despatched by rail. Hurrying through the rough stores and examining shop we come to the machine shop, in which 700 hands are employed, and where are rows of machine tools stretching almost as far as the eye can reach, extending 340 ft. in length. There are over 1,000 machine tools arranged in sections, all in close touch with each other. Passing the grinding and tool departments we reach the millwrights' section, where the repairs to

equally large scale, as are also the car-trimming and car-finishing shops, and the car stockroom.

The power station and gas producer plant (the latter adjoining the station) contains eight gas engines of 100 b.h.p., each running on suction producer, manufactured by Grice's Gas Engine Co., Ltd., Birmingham, and Carnoustie, Scotland.

Altogether the new factory ranks among the largest in the world, and equipped as it is with the most modern machinery it forms a notable addition to this country's industrial assets. In the preceding remarks no mention is made of the cycle building portion of the plant, which is not yet fully completed, while it should also be added that the large plant at Beeston continues, under the direction of Mr. T. C. Pullinger, to turn out large numbers of Beeston-Humber cars and cycles.

After the inspection on Thursday last week, the guests to the number of nearly 300 were entertained to lunch by the directors. Mr. E. Powell presided, and in responding to the toast of Humber, Ltd., gave a summary of the progress of the company, which is now sending motor vehicles to every country of importance throughout the five continents. Cars are going daily to the English dependencies, and even the high tariff wall erected by the United States cannot keep out Humber cars. Mr. Powell gave a number of instances which showed the world-wide character of their trade. The sales for the week ending March 7th exceeded by £3,000 the largest sales of any week up to two years ago.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE annual meeting of the Royal A.C. was held at the Old War Office (the site for the new club buildings), Pall Mall, London, S.W., on Thursday of last week, when there was a good attendance. The chair was taken by Mr. C. D. Rose, M.P., Chairman of the Club, supported by the Hon. Arthur Stanley, C.V.O., M.P., Sir David L. Salomons, Bart., Sir Henry Norman, M.P., Col. H. C. L. Holden, R.A., F.R.S., Mr. Robert Todd, Mr. T. H. D. Berridge, M.P., and Mr. W. Worby Beaumont. In moving the adoption of the annual report, the chairman referred to its salient features, particularly the Commercial Vehicle Trials, the termination of the agreement with the M.U., and the action of the committee in securing the site of the Old War Office for the new club building. As regards the accounts and balance-sheet the Chairman explained the chief items and pointed out that, although there had been a heavy expenditure on the Commercial Vehicle Trials, the Committee of the Club had decided to carry out the trials in view of their great importance. The annual report, the accounts and balance-sheet, and the budget for 1908 were passed and adopted. The general council of the club was re-elected, with the addition of the name of the Marquis A. Ferrero Ventimiglia (president of the Automobile Club of Italy). Alterations in the club rules necessitated by the club's scheme for the acquisition of new premises were approved and the president and vice-presidents of the club were re-elected. A vote of thanks to the chairman for the able way in which he had conducted the club during the year 1907 was moved by the Hon. Arthur Stanley, C.V.O., M.P., seconded by Sir Henry Norman, M.P., and carried with acclamation.

The postal ballot for the election of twenty-five members to fill the vacancies on the committee of the club resulted as follows:—Capt. F. E. Dyke Acland, Messrs. A. Armitage, T. H. D. Berridge, M.P., A. Bird, H. E. B. Bruce-Parker, E. H. Cozens-Hardy, Lieut.-Col. R. E. B. Crompton, C.B., Charles Hardy, Dr. H. S. Hele-Shaw, F.R.S., E. M. C. Instone, G. C. Ashton-Jonson, Major F. L. Lloyd, R.E., E. Manville, J. R. Nisbet, J.R., Wilson Noble, J. F. Ochs, Mervyn O'Gorman, Lionel de Rothschild, W. E. Rowcliffe, J. D. Siddeley, Stanley Spooner, H. W. Staner, the Hon. Arthur Stanley, C.V.O., M.P., Dr. J. Hopkins Walters, and Claude Watney.

The annual dinner of the Club was held in the evening at Covent Garden Theatre. A top table was arranged near the stage, a number of long tables were extended across the floor of the house, and circular tables to seat eight each were dotted about in other parts of the building. The number sitting down to dinner was 446; for the subsequent conversation 150 tickets were issued, and eighty private boxes were occupied by about 300 visitors, the total present thus exceeding 900 during the latter part of the evening. Mr. C. D. Rose, M.P., the Chairman, proposed the toast of "The King, our Patron," and the only other toast was that of the health of the Chairman himself, proposed by the Hon. Arthur Stanley, C.V.O., M.P. Among the guests were the Greek Minister, the Swedish Minister, the Hon. Arthur Stanley, C.V.O., M.P., General Sir John French, G.C.V.O., Mr. Roger W. Wallace, K.C., Lieut.-Col. Mark Mayhew, A.M.R., Sir David Salomons, Bart., Lieut.-General Sir C. W. H. Douglas, K.C.B., Major-General C. E. Heath, C.V.O., Sir Henry Edward, K.C.V.O., Mr. W. Joynton-Hicks, General the Hon. Sir N. G. Lyttelton, G.C.B., Col. Sir E. W. D. Ward, K.C.B., K.C.V.O., the Chinese Minister, Lord Montagu of Beaulieu, the Hon. Sir H. Trelawny Eve, Brig.-General A. J. Murray, C.V.O., Sir Forest Fulton, K.C., Brig.-General R. M. Ruck, Col. H. C. L. Holden, R.A., F.R.S., and Mr. Whitaker Thompson, L.C.C. An excellent entertainment took place from 10 p.m. to midnight.

MOTOR UNION.

THE annual meeting of members of the Motor Union is to take place on Wednesday next at the Victoria Hall, Hotel Cecil, London, following the general conference of members of any recognised automobile organisation to be held at the same place, at three o'clock, to consider the position of motorists as regards Budget taxation.

Motorists attending these events will be able to visit on the same day the exhibition of all classes of motor vehicles at the Agricultural Hall, London, and arrangements have been made by which members of the Union can obtain entrance free of charge on presentation of their 1908 cards of membership.

Arrangements are being made by the Signs and Notices Committee and the Touring Committee of the Motor Union for the issue of enamelled signs for recommended hotels and recommended repairers. The principal features of each sign will be the word "Recommended," "Hotel," and "Repairer," and the M.U. monogram badge.

Up till Tuesday morning the Union had received notifications that 154 local authorities had passed and forwarded to the Chancellor of the Exchequer the subjoined resolution or resolutions in similar terms:—

"This Council is of the opinion that it is desirable that the money raised from the taxation of motor and other vehicles should be paid into a central fund, from which grants shall be made to the local authorities towards expenditure on the roads."

AUTOMOBILE ASSOCIATION.

MEMBERS of the A.A. will be admitted to Cordingley's Motor Show at the Agricultural Hall any day during the Exhibition on presentation

of their member's ticket. The Association will also have a stand on the ground floor of the Hall, where the secretary and some of the staff will be in attendance to meet members and answer general enquiries. As in former years, appointments may be made and letters, telegrams, messages, &c., addressed for the convenience of members, c/o Automobile Association, Cordingley's Exhibition, Agricultural Hall, London.

The third annual dinner of the Association was held on Wednesday in the Grand Hall of the Hotel Cecil, London.

LINCOLNSHIRE MOTOR-CYCLE.

AT the meeting of the committee of the Lincolnshire M.C.C. on Saturday the question of the taxation of motorists was considered, and it was unanimously decided that the club inform the Motor Union that it regrets being unable to assist that union in its taxation movement, because of the belief of the committee that it is unfair that a particular class of the users of the roads should be singled out for taxation, and that it is wrong for the principle of users of the roads being singled out for their upkeep being introduced.

It was arranged to have the hill climb at Waddington on Easter Monday, and the round-the-county reliability trial on Whit-Monday. Mr. Brooke, the chairman of the Scunthorpe centre, offered a cup for a team trial, for teams of six, and Mr. Foster, the chairman of the club, announced his willingness to give a trophy for competition. Mr. Brunning, a vice-chairman, also offered a prize. It was decided to have a long distance trial, and from Lincoln to Yarmouth and back was suggested.

BROOKLANDS.

On Saturday, the 18th prox., and Easter Monday, the 20th prox., an important programme will be run by the Brooklands A.R.C. Nomination circulars and entry forms can be obtained upon application to the club at Carlton House, Regent Street, S.W.

The events will include the third 28-h.p., 40-h.p., 60-h.p. and 90-h.p. races of 150 sovs. each; the second Surrey stakes of 5 sovs. each, the Continental stakes of 50 sovs.; the Junior plate of 50 sovs. each; the sprinters' selling stakes of 5 sovs. each; the Naval and Military Cup, the Brooklands Cup and the Easter Handicap sweepstakes of 5 sovs. for acceptors.

Most of the races will be over a course of about three miles; the longest being the 60-h.p. race, which will be of a distance of 19½ miles.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

MR. DUGALD CLERK has been elected President, and Dr. H. S. Hele-Shaw and Mr. F. W. Lanchester Vice-presidents of the Institution for 1908.

The following have been elected on the Council:—Messrs. M. O'Gorman, Percy Martin, C. R. Garrard, F. L. Martineau, F. C. A. Coventry, D. Leechman, D. Mackenzie, A. Sharp, E. W. Lewis, E. E. Baguley, A. S. Hill, F. R. Simms, W. W. Beaumont, J. L. Sampson, D. J. Smith. Mr. R. K. Morcom has been co-opted a member of the Council.

A general meeting of the members of the London branch of the graduates' section of the Institution will be held on Tuesday, the 31st inst., at 1, Albemarle Street, Piccadilly, London, W., when a debate on "Live Axle v. Chain Drive" will be opened by Messrs. Percy Bishop and D. M. Power.

AUTO-CYCLE UNION.

THE annual general meeting of the Council will be held to-day (Saturday) at 3 p.m., at the Imperial Restaurant, 60 and 62, Regent Street, London, W., and not at the Criterion Restaurant, as previously arranged.

It has now been definitely arranged that the annual race meeting of the Auto-Cycle Union will take place at the new Stadium at Shepherd's Bush on August 22nd.

AERO CLUB.

ON Thursday afternoon the members of the Aero Club of the United Kingdom held their annual general meeting at 166, Piccadilly, S.W. The business transacted included the election of the committee for 1908-9, and the confirmation of certain additions and alterations to the rules and by-laws. As regards the new committee, no ballot was necessary, as the following eleven members had been nominated for eleven vacancies:—The Hon. Claud Brabazon, Mr. Ernest Bucknall, Col. J. E. Capper, C.B., Vice-Admiral Sir Chas. Campbell, K.C.M.G., Mr. John Dunville, Mr. Martin Dale, Capt. A. H. W. Grubb, D.S.O., R.E., Mr. J. T. C. Moore Brabazon, Viscount Royston, the Hon. C. S. Rolls, and Mr. Roger W. Wallace, K.C.

MR. C. W. BROWN, of Hollyville, North Finchley, N., has been elected hon. sec. of the Junior A.C.

THE Leeds Motor Cycle Club, of which Mr. H. S. Atkinson, 72, Avenue Hill, Leeds, is hon. secretary, is arranging a series of inter-club meets during the season. J.M.E.A. 13288

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING THE SPEED LIMIT IN ROYAL PARKS.

On Friday of last week one Metropolitan magistrate dealt with a batch of seventeen summonses against motor-car drivers for exceeding the speed limit of ten miles an hour in Hyde Park. The facts were proved by Sergeant Filce, of the A division, who, with Constable Pick, timed the defendants over a measured furlong. The speeds ranged from sixteen to twenty-four miles an hour. Four of the cars were taximeter cabs. The fines ranged from five shillings to sixty shillings. This makes a total of seventy similar cases within a month.

DANGEROUS SPEED.

At the Brighton Borough Bench, Luis Martin de Saint Sumera, of Gerrard Street, London, W., was summoned for driving a motor-cycle on the Grand Junction Road, Brighton, at a speed dangerous to the public, having regard to all the circumstances of the case, on February 20th. Defendant made a statement—which was interpreted as a plea of not guilty—to the effect that he thought he was allowed to travel at twenty miles an hour. The Chief Constable (Mr. W. B. Gentile) said he had ascertained that defendant had only been in the country a short

FAILING TO GIVE NAME AND ADDRESS.

Frederick Southgate, living at 1, Werner Road, Putney, was summoned before Mr. Garrett, at West London Police Court, on Tuesday, for driving a motor-car in a dangerous manner in Fulham Road, on February 12th, for failing to give audible warning of his approach, and for failing to give his name and address after an accident. Mr. Barker (Wontner and Sons) supported the summonses on behalf of the Commissioners of the Police, and Mr. Freke Palmer defended. After the accident the defendant stopped, and, though asked by an omnibus conductor to give his name and address, refused point-blank to furnish that information. The defendant said he was driving Miss Deacon, the sister of his employer, Mr. Deacon, J.P., of Grantham House, Putney Heath, and another lady in the car. Miss Deacon stated that the accident was entirely due to the dangerous driving of the motor-bus driver, who "deliberately took their (the motor-car's) road, and but for the clever driving on the part of the defendant, a serious accident must have occurred. The magistrate observed that he had often thought that such cases should with more satisfaction to everyone be tried before a civil tribunal. He had never known a case where there was such a conflict of evidence, each of the witnesses for the prosecution having given a different version of the accident. He did not think that,

One of the two Public Service Vehicles now in use in the town of Gmund, Bohemia.

A feature of the vehicle is that while it runs on the ordinary roads it is electrically propelled by means of current taken from an overhead conductor, the same as electric tramways. *[Allgemeine Automobil Zeitung.]*

time. On the occasion in question he was travelling at about twenty-four or twenty-five miles an hour, and all the policeman who stopped him could get out of him was "Grand Hotel." Defendant was probably ignorant of the regulations, and, under these circumstances, he (the Chief Constable) could be satisfied if the defendant would promise not to drive so fast in the future. Defendant gave his Worship the required promise, and paid the costs (14s.).

A DISMISSAL AT HOVE.

Leonard Cushman, of Franklin Road, Portlade, was summoned at Hove for driving a motor-car without a rear light on the car at Portlade, after dark, on March 5th. Mr. H. E. Tringham appeared for the defendant, who pleaded guilty. In mitigation Mr. Tringham submitted that it was quite an accident. The defendant, he said, was merely taking the car from one road to another, and the light went out. He appealed to the Bench not to record a conviction against the defendant, who was a young driver, as it would mean endorsing his licence. P.C. Rummery, who had given evidence in support of the case, was recalled, and said the defendant was driving the car at the rate of about eight miles an hour. The Bench dismissed the case on payment of costs, and warned defendant to be careful in future.

where a motor-car driver had no reason to believe that he was responsible for an accident, he was bound to give his name and address to a layman, and there was nothing to show that the presence of the motor-car was responsible for this accident. While considering that the defendant would have exercised a wiser discretion in pulling up his car altogether at this very dangerous part of the road, he did not hold that he had acted with criminal negligence. He dismissed the summonses.

MR. CHARLES P. WILSON, the hon. secretary and treasurer of the Yorkshire A.C., has changed his address from Town Hall Chambers, Victoria Square, Leeds, to 24 and 25, Basinghall Buildings, Basinghall Street, Leeds.

FROM the "Empress" Motor Company, Ltd., of Stockport Road, Manchester, comes a copy of the new catalogue of "Empress" cars. The list gives full particulars and illustrations of the various models, 16-20-h.p. and 20-24-h.p. four-cylinder and 24-30-h.p. and 30-36-h.p. six-cylinder, which are making their first appearance in London at the Cordingley Show. The catalogue also gives details of the company's "Perfecta" carburettor, which has already been described in the M.C.J.

FORTHCOMING EVENTS.

MARCH.

- 21st (Saturday)—28th (S.).—Open daily from 10 a.m. to 9 p.m.
CORDINGLEY'S THIRTEENTH INTERNATIONAL MOTOR-CAR EXHIBITION
 will be held at the Royal Agricultural Hall, London.
- 21st (Sat.).—Annual general meeting of the Council of the Auto Cycle Union.
- 24th (Tu.).—The annual general meeting and dinner of the Crystal Palace A.C. at the Restaurant Frascati, Oxford Street, W.
- 25th (W.).—General Conference of Automobilists under the auspices of the Motor Union, to consider the question of motor-car taxation and other Parliamentary proposals affecting motorists.
- 26th (Th.).—Ladies' Automobile Club Day at the Motor Car Exhibition at the Agricultural Hall, London.
- 27th (F.).—Meeting of the Cycle and Allied Trades' Association at the Agricultural Hall, London.
- 28th (S.).—Closing day of the Cordingley Motor Show.
- 29th (Sun.).—Opening Run of the Southend Motor Club to the White Hart Hotel, Witham.
- 31st (Tu.).—Last day for receiving entries, at ordinary fees, for the International Touring Car Race.

APRIL.

- 4th (Sat.).—Auto Cycle Union dinner to road-menders on the Ripley road at the Anchor Hotel, Ripley.
- 11th (Sat.).—Annual open Flexibility Contest of the Crystal Palace A.C. Opening meeting of the Nottinghamshire A.C. at Edwinstowe.
- 16th—20th.—Easter Tour of the Motor Cycling Club.
- 17th (Good Friday).—Lincs. M.C.C. meet at Mablethorpe.
- 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.
- 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F. Opening meet of the Yorkshire A.C. at the Hotel Majestic, Harrogate.
- 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Epping.

MAY.

- 1st (F.).—The Frome's Hill Climb of the Herefordshire A.C.—provisional.
- 2nd (Sat.).—Impromptu pace judging competition of the Sheffield A.C. at Ollerton.
- 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
- 10th (Sun.).—Targa Florio Race.
- 21st (Th.).—25th.—Reliability Trial of the Irish A.C.
- 23rd (Sat.).—Clipstone race meeting of the Notts A.C.
- 25th.—Industrial Vehicle Competition of the A.C. de France.
- 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
- 5th—6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
- 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
- Start of the International Touring Car Trial of the R.A.C.
- 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
- 15th—19th.—Scottish Reliability Trial.
- 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
- 27th (Sat.).—Hill climb of the Midland A.C. at Shelsley Walsh. Saltburn beach races.
- 28th (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
- 6th (M.).—Grand Prix A.C.F. (Voiturette section).
- 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
- 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
- 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club. Annual Open Hill Climb of the Midland A.C.
- 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

AUGUST.

- 29th (Sat.).—Meet of the Lincolnshire Motor Club at Lincoln.
- 30th (Sun.).—Southend M.C. run to Great White Horse Hotel, Ipswich.

SEPTEMBER.

- 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

BUSINESS NEWS.

THE DUKE OF MARLBOROUGH has purchased a Siddeley 45-h.p. six-cylinder car from the Wolseley Company. The Hon. Neil Primrose has also ordered an 18-25-h.p. Siddeley vehicle.

MR. A. E. CREESE is opening a new garage at No. 1A, Barry Road, East Dulwich, S.E., where Brouhot cars can be had on hire. Plant is also being put down to enable repairs of every description to be carried out.

MESSRS. HURST AND MIDDLETON, LTD., at their works at Windsor Road, Holloway, N., are well equipped for the carrying out of motor-car repairs of all kinds. They are also making a speciality of gear-cutting.

MR. FRANK MORRIS, late of King's Lynn, has been appointed manager of the motor department of the London and Paris Exchange, Ltd., 55-59, Shaftesbury Avenue, London, W.C.

THERE is one matter of importance to the purchasers of Argyll cars, viz., that the company's system of agencies is so complete that buyers, when touring the country, are hardly ever at any distance from a point where expert advice or parts for an Argyll car can be secured.

FROM the Swift Motor Co., Ltd., Coventry, comes an extremely neat and useful oxidised copper ash tray. The company ask us to mention that they will be glad to send one to any of our readers making application for the same.

MESSRS. BENETPINK AND CO., LTD., of Cheapside, London, send an excellent coloured representation of the C.A.V. accumulator, for which they are the City agents.

FROM the Daimler Motor Company, Ltd., comes a copy of the new catalogue they have issued of Daimler cars in the Spanish language. The Daimler cars are very popular in Spain, and the new list should tend to increase the business in these vehicles in that country.

MR. J. A. RYLEY, of 23, Martineau Street, Birmingham, has his 1908 catalogue in the printers' hands.

THE SIRDAR RUBBER COMPANY, LTD., have had a repeat order for the King for Sirdar carriage tyres.

HERR OTTO DREUSEN, of Copenhagen, has sent us a copy of his latest catalogue of cycle and motor accessories. Extending to about 150 pages, the list is most complete, and should be of assistance in greatly increasing his business in Denmark.

MR. G. MAXWELL BROWN has joined the firm of Messrs. W. Searle and Co., and all inquiries relating to M. Perez and Co. for A.V. plugs and Fulman accumulators should be sent to Messrs. W. Searle and Co., 23, Glasshouse Street, London, W.

THE Wolseley Tool and Motor-car Company have just issued a new catalogue of the Siddeley industrial vehicles. The cars illustrated and described include char-a-bancs, buses, fire-engines, lorries, vans, wagonettes, private buses, ambulances, and motor-cabs, and, as particulars are given of each, the list is naturally very complete.

THE Star Cycle Company, Ltd., of Wolverhampton, are prepared to undertake the re-treading and repairing of motor tyres, and, having an extensive plant at their command, can give prompt delivery.

WE learn that Mr. E. H. Lancaster severed his connection with the Enfield Autocar Company, Ltd., at the end of last month; he is, however, continuing to give the receiver and committee of the company every possible help towards bringing about a revival of its prospects.

THE Stepney Spare Motor Wheel, Ltd., have sent us a photograph of a new showcard they have recently brought out. The subject is a London motor-cab rank fitted with Stepney wheels. On the back is printed a complete catalogue of Stepney wheels, so that it answers the double purpose of a catalogue and a showcard. Agents can be supplied with copies on application.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, MARCH 28, 1908.

[No. 473.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

NOT only was the annual dinner of the Automobile Association an enjoyable event, but it brought forth valuable testimony as to the work that is being done in the interests of motorists. Having regard to the official positions he has held in the Government, the letter from the Earl of Onslow was especially significant. He pointed out that at one time numbers of convictions were obtained against motorists who fell into Surrey police traps for having exceeded the speed limit on open spaces of roads. "There are now," he added, "comparatively few. It is true that the result has been a falling off in the revenue derived by the county authorities from fines, but, even as a large ratepayer in the county, I cannot regret this source of relief to our rates, seeing that it is due to more careful driving, owing to the supervision executed by the watchmen of the Association, warning all its members that they must drive with consideration. The amenities of our Surrey roads, both as regards the motorist and the policeman, are much improved." This must be regarded as a sufficient vindication of the methods and the policy of one of the most virile organisations in the automobile world.

The Cordingley Show.

TO-DAY (Saturday) will see the last day of the thirteenth of the series of motor-car exhibitions organised by Messrs. Cordingley and Co. at the Agricultural Hall, London. The fourteenth will be held at the same place from March 20th to 27th, 1909, and plans and prospectuses are already obtainable by those interested in securing good positions in the Hall. This year's display is being fully reported elsewhere in our columns, and we would take this opportunity of informing those readers who have been unable to attend the Exhibition that copies of the catalogue can be obtained from the publishers on postal application to 27-33, Charing Cross Road, accompanied by 9d. in stamps. The published price is 6d., and orders for the same can be given to newsagents from whom the *M.C.J.* is obtained.

Popularising Brooklands.

EXPERIENCE has proved to the promoters of the Brooklands Track the necessity of giving popular interest to the events at their race meetings, and the Easter programme will be full and varied. In addition to the speed contests, some of which should provide excitement in their finishes, two innovations are now announced which should each draw some visitors. The inclusion of a motor-cycle event will appeal to a large number of enthusiasts, and we hope an extended entry for the first Brooklands motor-cycle race will justify further encouragement of that form of sport. This trial event will be for motor-bicycles, of which the engines, of twin-cylinder, do not exceed 80 mm. by 98 mm. for each cylinder. It will be over a distance of about five and a half miles. The second innovation consists of the Tyre Change Plate, for motor-cars propelled by means of internal combustion engines only, of a cylinder dimension 55 to under 65, carrying one complete

spare back tyre. At a specified place during the race the complete tyre of the right-hand back wheel will be replaced by the spare tyre carried, which must be duly fixed and inflated by hand pumping. Detachable rims and wheels are barred from the race, which is over a distance of about three and one-third miles. Entries for both these events will close on the 9th prox.

Educating M.P.'s.

WE understand that members of Parliament representing the Parliamentary divisions of Sheffield and the adjoining part of Yorkshire, have received communications from the Sheffield and Hallamshire Motor Cycle Club with regard to the taxation of automobiles. This is a kind of education which county organisations might well serve out to their Parliamentary representatives, for, while the national associations interested in motoring may be able to influence public opinion to some degree, there is often greater intensity of influence in the communications of the local organisations to their local members. Although nothing is yet known as to the extent of the financial intentions of the Chancellor of the Exchequer, motorists must not slacken their efforts to inform M.P.'s as to the detrimental effect that any greatly increased taxation would have upon the trade of the country.

Taxes for Roads.

MEANWHILE those who look to the increased taxation of motorists as a means of assisting the ratepayer are continuing their activity, and the County Councils Association have been interviewing Mr. Asquith and Mr. John Burns on the subject of upkeep of main roads. In urging that the Imperial Exchequer should make grants for this purpose, the spokesmen of the deputation were not slow to point out that, in their opinion, motor traffic was greatly responsible for the increase in the up-keep of the roads, and at least one of them declared that the motor problem had become well-nigh intolerable. Another speaker urged that in the Birmingham and Coventry area local authorities were subject to a great deal of extra expense owing to the roads being used for trial purposes by motor manufacturers in those districts. In replying to the deputation, Mr. Asquith accepted the declaration as to the increase of the cost of main roads during the past ten years, but he was inclined, while recognising the motorist as a factor in the advance, to also attribute a portion to a higher conception of the standard as required by local authorities compared with what was necessary a decade ago. In his speech, however, there was no indication as to his future proposals, and on this interesting point we are left as much in the dark as before.

The Views of Legislators.

A MEETING of members of both Houses of Parliament has been held to consider the question, at which about twenty-four legislators, belonging to both the great parties in the State, were present. They naturally were against further taxation of an industry which is already sufficiently financially handicapped, but their dolorous view may be inferred from the resolution that was adopted to the effect that in the event of taxation

B

of motor-cars being increased, it should be strongly urged upon the Chancellor of the Exchequer that a National Road Department should be established to deal with the upkeep and improvement of such main roads. A committee, composed of the Duke of Sutherland, Lord Onslow, Lord Montagu of Beaulieu, Mr. C. D. Rose, Sir H. Norman, and the Hon. Arthur Stanley, was appointed to communicate the resolution to Mr. Asquith.

Club Organisation.

PROVINCIAL and county club organisations have much to thank their honorary officers for. The work of an honorary secretary in securing invitations for meets, in arranging dates to suit the majority of the committee, and in keeping members informed of arrangements, is no light task and entails considerable labour. We understand that this fact is being recognised by the Lancashire A.C., who are considering the appointment of a paid secretary to assist their present honorary secretary in his arduous work. This question of assistance to officials is one that is becoming a practical matter in many other club organisations, and doubtless many will watch the example of the Lancashire motorists with a view to imitation in some form or other before long.

The Crown Prince of Germany with his F.N. Four-Cylinder Car.

Irish Motorists and Licence Duty.

IN the House of Commons, an evening or two ago, Mr. T. H. Sloan, who represents a Belfast division, asked the Secretary to the Treasury if he could explain why an Irish motorist is obliged to pay licence duty to the Board of Inland Revenue on a motor-car which may only be passing through Great Britain, notwithstanding the fact that he is registered in Ireland as the owner of such motor-car. Could the Secretary say why an Irish motorist, keeping a motor-car in Great Britain, was obliged to pay licence duty for a whole year, and in addition thereto was liable to a fine for failing to take out a licence, although he may have only used the car there for one day. Mr. Runciman, in reply, said that there was no exemption from licence duty in favour of motor-cars used in Great Britain by persons resident elsewhere, and he "saw no reason to alter the law." So that want of uniformity to which we first called attention some months ago, is to continue indefinitely. We trust the motoring M.P.'s, who now form a considerable body in the House of Commons, will make a note of the anomaly with a view to securing equal treatment for all. Is it too much to hope, in the present financial uncertainty with regard to motoring, that the regulation that is good for Ireland may be extended to this side of the Irish Sea?

Conference on 'Bus Traffic.

ON Monday many of the Metropolitan authorities were represented at a conference held at Hammersmith to consider whether action could successfully be taken to lessen the growing noise from motor traffic in London. After much discussion it was resolved "That the abnormal development during recent years of motor and other mechanical passenger and goods traffic in metropolitan thoroughfares, and the resulting nuisance and annoyance to the public therefrom, has necessitated the revision and expansion of the present regulations and conditions." Naturally many strange things were said, and many were in favour of new legislation to deal with what is persistently called a "nuisance." Surely such a term is really a misnomer, and allowance may reasonably be made for the troubles incidental to a new form of traffic which everyone recognises as likely to effect a very considerable revolution in the social affairs of the country.

The Extent of the Traffic.

ON this question of motor-bus traffic in London Mr. Gladstone, as Home Secretary, had several questions addressed to him in the House of Commons on Tuesday, and in reply said that the traffic of motor-omnibuses in London was regulated by the Motor Car Acts of 1896 and 1903, the several Public Carriage Acts, and the orders made under the Motor Car and Public Carriage Acts. The maximum weight and permissible speed of these vehicles was laid down in the Local Government Board Order of December 27th, 1904. Some check to unnecessary smell and noise was afforded by the regulations of the Commissioner of Police as to the conditions to be fulfilled before a license was granted. Moreover, the owners of vehicles which were found to offend in these respects were frequently served with notices forbidding them to use the vehicle again until the defect had been remedied. Earlier in the day Mr. J. H. Moore, the Chairman of the London Road Car Company, had given the shareholders of that concern some information as to the traffic developments of the Metropolitan, and informed them of the coming amalgamation with the Great Eastern London Motor Omnibus Company, which owns about 88 motor-buses. He showed that whereas the railway and bus companies carried 375 millions of passengers in 1899, they—supplemented with tubes and motor-buses—carried 619½ millions of passengers last year.

The Dust Trials.

THE complete report of the judges in last year's Dust Trials has just been presented to the R.A.C. Our readers will probably remember that these were held early in the year. The judges have come to the conclusion that the 130 photographic records, taken at speeds varying from twenty to sixty miles an hour, form a valuable series, indicating the character of the dust wake raised by motor-cars better than any series that have yet been produced. It seems to have been well established that the density of the dust increases with the speed, and the committee is still investigating that aspect of the matter. It is noted that every one of the steam cars tested raised less dust than the petrol vehicles. Experiments are shortly to be carried out to determine whether the rubber-studded tyres fitted on the wheels of the steam car contributed to the excellent results shown by that vehicle. Referring to the devices tested, that of Messrs. Dennis Bros., in which the wheels were cased in, is favourably mentioned, and further tests are to be made with that vehicle. Mention is given of the dust preventing arrangement devised by Messrs. Wayman and Matthews, and which is now on view at the Agricultural Hall. The car is fitted with a double bottom, through which a current of air passes beneath the vehicle, and is deflected upwards at the back at an angle which the inventor has found to give the best results. The effect obtained is due to this air filling a partial vacuum formed behind the back. A small deflecting shoe was fixed behind each wheel. The clearance from the ground was extremely small.

Ordinary tyres were used, and the spokes of the wheels were covered by discs. Further experiments were carried out by one of the members of the Committee on the highway near Staines with this car, and photographic records were obtained, showing that this invention does undoubtedly tend to prevent the rising eddies, and hence allows the dust raised by the wheels to be kept low, and so quickly fall to the ground. The Committee has noticed that cars fitted with dust screens and overhanging hoods at the back, although they may contribute to the comfort of the passengers in the car, certainly do so at the expense of the other users of the road—a view that may excite some controversy.

Motor-Car Materials.

BEFORE the Sheffield Society of Engineers and Metallurgists, on Monday, Mr. A. W. Reeves gave his views on the "Materials of Motor-car Construction." These are referred to elsewhere; here, however, we may give his opinions as to the requirements of the motoring public. These were summarised as a car capable of a given average speed over give-and-take roads, with reliability as a prime factor. Economy of upkeep was a *sine qua non*; there should be lightness of weight consistent with a given horse-power, and, of course, comfort in

the provinces, as well as from nearer London, visitors can come with the assurance that this is a favourable opportunity to purchase as well as to inspect cars.

Public Warnings.

THE railway companies foster a kind of fear in the minds of those passengers and others who seek to obtain free rides, or to damage their property, by posting particulars of convictions in conspicuous places on their premises. This is said to have a deterrent effect; and now a somewhat similar plan is being discussed by the Motor Union. Complaints have been received from motorists at Hull as to the throwing of stones, mud, &c., at their cars. In one case in which the motorist, a local medical man, furnished the name of the offender, the M.U. wrote to the father, who chastised the boy with, we hope, good effect. If these complaints continue the Union should go further and prosecute the delinquents there, as it has already done in other districts. In one of the most recent prosecutions two men were fined 20s. and costs each for throwing stones at a car driven by a Member of Parliament. In some localities this dangerous pastime would appear to be frequent, and motor-car owners, garage proprietors, and others who are willing to display warning placards giving particulars of convictions for assault,

Industrial Motor Vehicles in Russia.

The above illustration depicts the N.A.G. motor lorry belonging to the Serginaki Ufalinaki Mining Company of Ufalet (Perm), Russia. The roads in the district are, as may be judged from the picture, anything but suitable for automobiles, but we learn that, notwithstanding this, the vehicle is giving every satisfaction.

travelling. Mr. Reeves referred to the difficulties experienced by the early British designers in getting materials which in any way approached in resisting powers those obtainable upon the Continent. Now, however, the metallurgist and steelmaker in this country was realising that there should be no necessity for the importation of foreign unfinished parts.

Bargains in Cars.

ONE interesting fact concerning the automobile exhibition now proceeding at the Agricultural Hall is with regard to the opportunity that is provided for securing splendid vehicles at reasonable prices. Those who go with cash in hand will recognise that this event constitutes an unique Motor Mart and Exhibition, bringing motoring well within the financial range of many who have regarded the sport and pastime as wholly beyond their means. Not only is this true as it affects the new vehicles shown in the Great Hall, but in the Gilbey Hall is a selection of cars that have already passed the "road test," and can be depended upon to give their owners a satisfactory introduction to the scenery of their native land. From

obstruction, and stone throwing, are invited to communicate with the organisation with a view to full publicity being given the matter.

The Kentish Highways.

IN view of the near approach of Easter, Mr. H. P. Maybury, the County Surveyor of Kent, is inviting motorists who pass through that county to keep to their near side of the road. He has noticed that there is a tendency for drivers to maintain the bee-line as nearly as possible in the centre of the roadway, and, as he remarks, with high speed and armoured tyres, the damage to the surface is said to be considerable. As a practical point, it is suggested that if the same track was not continually taken, the damage would not be so marked. One of the points that will be urged is that, in consequence of excessive camber, motorists are compelled to keep to the centre. Whilst this was a sound contention a few years ago, it no longer applies to the main roads of Kent, as these have been considerably flattened and strengthened at the sides, thus adding width and conducing to safety.

THE BEST FORMS OF CONTROL FOR LADY DRIVERS.

AN easy form of control is usually one of the first items on the list of things to be remembered by intending purchasers of a car for lady drivers, so while visiting Cordingley's interesting show I turned my attention to the various forms of this important part of an automobile's anatomy. After many hours spent in examining the numerous types shown at Olympia last November, one is glad to find several exhibits not seen there. The 16-20-h.p. Stella, a Swiss-built car, is a new-comer. It is termed the "ideal ladies' car," and though, unfortunately, I have not yet had the opportunity of being at the wheel of one, it appears to merit the title. The control is especially well arranged. There is the usual lever on the steering wheel, but moving this for about a quarter of the full distance (the exact

sion of air from the atmosphere; secondly, admission of heated air; and thirdly, total exclusion of extra air, for starting the motor; it is worked by a small lever on a sector fitted to the dash. Another point in favour of the F.N. chassis is the butterfly throttle, rotating in the inlet pipe, coupled to the clutch pedal, thus acting as a governor when the clutch is withdrawn. Although many ladies would be careful in minor details, there are many more who like to drive with the minimum amount of trouble and thought, for these the above refinement is strongly to be recommended, as it will automatically save wear and expense.

The model that should appeal to drivers who like an extra amount of comfort in the control arrangements is the 20-h.p. six-cylinder Standard that Mess's. Scott Russell and Brée are showing. The ignition and throttle control levers are fitted to the steering wheel, but do not move with it, to my mind an item

Mrs. Wainwright, of Buarbrae, Eaton, Norwich, at the wheel of her 30-h.p. Beeston-Humber, which she has driven 3,000 miles without the slightest trouble.

position being indicated on the sector) only brings into use one jet of the carburettor, and the car can thus be driven in thick traffic on top speed. When the lever is moved beyond the mark a second jet comes into action; but except for use in open country, when one's ankles are apt to get tired from long pressure on a pedal, it is most convenient to use the foot accelerator, which is another means of bringing the second jet into operation, and at the same time allowing the wheel control to be left for the use of one jet. The ignition is low-tension magneto, and has a particularly easy adjustment for the tappets, which would interest anyone wishing to attend to their car themselves.

The 14-16-h.p. F.N. car, hailing from Belgium, is another new exhibit, and an excellent one for lady drivers, as it avoids a lot of muddling levers to be fiddled with while driving, yet provides facilities for hand adjustment of the air to suit variations in the temperature. The device consists of a cylindrical chamber beneath the carburettor, which contains a rotating metal drum that has three apertures allowing of, firstly, admis-

tion of air from the atmosphere; secondly, admission of heated air; and thirdly, total exclusion of extra air, for starting the motor; it is worked by a small lever on a sector fitted to the dash. Another point in favour of the F.N. chassis is the butterfly throttle, rotating in the inlet pipe, coupled to the clutch pedal, thus acting as a governor when the clutch is withdrawn. Although many ladies would be careful in minor details, there are many more who like to drive with the minimum amount of trouble and thought, for these the above refinement is strongly to be recommended, as it will automatically save wear and expense.

Although visiting the Show with the express idea of looking only at the best forms of control, no feminine eye could help being attracted by the elegant "Sedan-chair" body fitted to a 10-14-h.p. Renault, shown by the Metropolitan Garage Association, and I must digress from my subject for a moment to describe it, as it is a car specially suitable for a lady. It is a two-seater, enclosed in the form of a doctor's coupé,

with a very neat patent folding seat at the back, which can be made to disappear into the luggage platform when not required. The whole is painted a very pale green, almost a "duck's egg" shade, and upholstered in grey cloth. It would be difficult to imagine a better constructed body for a lady who wishes to drive herself about town, or to functions, when it is desirable not to arrive looking as if one had been out in a gale. The control of the car is exceedingly simple, being by accelerator pedal only; the ignition is fixed, the high tension magneto running at engine speed. On this model there is an excellent arrangement to show which gear is in use; the speeds are operated by a notched quadrant device; over the quadrant is fixed a brass plate marked with the positions and numbers of speeds, "0" standing for neutral; on the lever itself is a pointer, therefore showing which gear is in use.

A car not seen at Olympia is the Vivinus. Of the three models shown I preferred the 16-20-h.p. chassis; the control is by lever on the steering wheel and foot accelerator, which opens a butterfly valve regulating the gas. The air supply is automatic, unless a Longuemare carburettor is ordered, there being an extra lever on the dash to fit up to this should a purchaser prefer it. The lubrication is by pressure and sight feed, so there is not much to trouble one while driving this car. The ignition is by Nilmelior magneto, and can be worked in all positions from one switch on the dash, but alteration would seldom be required, and, if necessary, it is easily moved by a touch of the foot.

Among the small cars, one of the simplest for control arrangements is the "Turicum" voiturette; there is a pedal for control, and no levers on the steering wheel; the ignition is fixed, being low-tension magneto; the chief point, however, about the exhibit is its transmission by the friction of one wheel or disc, connected to the engine, with another similar disc, in connection with the driving wheels, set at right angles and in frictional contact with the former; by moving the latter's position in relation to the wheel driven by the engine any speed from zero to twenty-five miles per hour is obtained by the simple forward and backward movement of a side lever. Being unable to obtain a very good view or description of the car, owing to a crowd of people intent on the same object, the above is but a rough idea of the general arrangement. It is certainly a model to be considered by those to whom gear changing is a terror and who like an exceedingly simple control.

A comfortable car for driving is the No. 8 Jackson two-seater. The change-speed and side brake levers are in a nice position to the hand; the control of ignition and gas is on the steering wheel—the throttle being of the "snail" type, a very fine adjustment is claimed for it. Below the wheel on the steering column is a small lever working an extra hot-air inlet; these refinements one does not always find on cars priced so low as the Jackson, and I consider, for those who are good enough drivers to be undisturbed by additional hand adjustments, it adds tenfold to the interest of driving not to have the air and ignition automatically controlled. Other small cars that I noticed for simplicity of control were the 8 and 10-12-h.p. Starlings, New Pick, and Reo; the first-mentioned should be an easy single-cylinder car to drive, it is governed by variable inlet valves operated by a lever fitted under the steering wheel. It has a "gate" change and three speeds forward and reverse, an advantage not generally to be procured on small cheap cars; the 10-12-h.p. runs on nearly identical lines, with the addition of an accelerator pedal. The New Pick is an extraordinarily low-priced four-cylinder British built model; the control is by means of a pedal actuating the throttle, and a lever beneath the steering wheel for the advance and retard of the spark. The Reo is a well-known American make; for preference I should choose the 18-22-h.p. chassis for a touring body. Having epicyclic gear, it is simple to drive, for a lever by the driver's seat introduces the first and top speeds, by a pulling back and forcing forward movements, a pedal being used for the reverse; there is also an accelerator pedal connected up to the throttle valve, and by this the speed of the car can almost entirely be governed; a lever on the steering column beneath the wheel controls the

ignition. Having to visit the Show on the opening day, I was unable to see all the exhibits, as several stands were not complete, and in a short article it is most difficult to do adequate justice to the numerous makes, but those that I have endeavoured to describe struck me as particularly suitable for ladies who like easily driven cars.

MECHANISTE.

THE AUTO-SLIP.

AN ingenious arrangement designed to avoid the necessity of a motor pit has recently been introduced by M. E. Huchet, of Quai Ile-Gloriette, Nantes, France, who points out that a pit is not always convenient, as cars may be standing over or around it, whereas the auto-slip, as the new device is

Fig. 1.—Detail View of the Auto-Slip.

known, can be readily placed in any desired position. Moreover, the manifold dangers and dampness of the pit are avoided. From Fig. 1 it will be seen that the auto-slip is formed of two iron-plated wooden side members A, pivoted and rocking about the centres B on the stout frame C, the side members of the latter being carried on three joists, which rest upon the ground. To the rear cross member is attached a small winch, by which the car is hauled on to the slip by the attachments G H shown in dotted lines, stops I being provided to prevent the car running off at the opposite end. When the car has been drawn to a position of balance the wheels are strapped firmly to the rocking bridge members, and the vehicle can then be tilted forward or backward in such wise as to give easy access to the

Fig. 2.—The Auto-Slip with Car in Position.

front or rear of the chassis, which are raised a distance of about 4 ft. 6 in. from the ground. The auto-slip, which when not required can be readily packed away so as to only occupy a small space, is designed to take cars of a maximum weight of two tons and wheel base of 9 ft. 10 in.; while as regards the wheel track, provision is made so that with a little adjustment the one apparatus will accommodate vehicles ranging from 4 ft. to 4 ft. 7 in.

GOSSIP FROM PARIS.

It is probable the month of May will see Mr. Henri Farman in England. Last Saturday he beat his own record of 1 kilometre by an officially recorded flight of 2 kilometres 4 metres 80 centimetres. But as he had to veer round poles placed only 500 metres apart, even the officials of the Aero Club estimate his flight at 4 kilometres or 4,374 yards. This feat was achieved in 3 min. 31 sec. His ambition is to fly across the Channel, but for the present he will content himself with having his aeroplane packed away in a railway van, and with taking the train and boat like the commonest of mortals. His intention is to compete for the Graphic £1,000 prize for a mile flown in a straight line, and he will most surely try to perform yet greater feats. The Mayor of Yarmouth has written to him officially offering to place the South Denes racecourse at his disposal for his experiments. According to all accounts it is one of the most suitable spots within easy access of London. No doubt the British Aero Club will accept that place and will send its representatives to officially control the flights. It seems likely that one or more other prizes will be offered by the town of Yarmouth for a flight to a certain distance and back to the starting point without touching ground.

THE aeroplane Mr. Farman will bring to England is the same with which he won the Deutsch-Archdeacon prize. It has, however, been considerably improved in many details. The wings have been stripped of their old canvas, which has been replaced by a specially prepared linen covered with a layer of indiarubber gum, making it impermeable to both air and water. The bearing capacity of the machine has thus been increased and the weight of the apparatus diminished. The motor is always the great trouble. A fortnight ago the new 50-h.p. Renault motor on which Mr. Henri Farman had founded such high hopes was fitted on the aeroplane. But after trial it was found necessary to send it back to the manufactory to be overhauled. The motor will probably be got into good working order before Mr. Farman comes to England and be used by him on his aeroplane, as it is expected to give a larger horse-power than the Antoinette motor. It is in itself heavier than the latter, but, being air-cooled, requires no water tank and piping. This leaves the balance of light weight in its favour.

A GREAT many people have constructed or are building flying machines, but if the brothers Wright, whose performances were not made in public, are excepted, there was till last week only one flying man. Now there are two, and there is, fortunately, every reason to hope and expect their number will go on increasing rapidly. Though it is undoubtedly M. Santos Dumont to whom the honour and glory of demonstrating the possibility of flight belongs, yet his bound of 220 metres can scarcely be said to have made him a flying man. It was Mr. Henri Farman who first flew, and it was M. Delagrangé who followed him last week with a flight of 1,500 metres. The two flying men have been good friends for a long time, and, curiously enough, they are both artists, Delagrangé being a sculptor and Farman a painter, though the latter is also in partnership with his elder brother in an automobile firm. It was Delagrangé who first constructed a machine. In the first instance Henri Farman did little more than copy it. But neither of the aeroplanes would fly. After infinite trouble and study Farman succeeded in improving his machine so materially that though he started last he came in first. And now Delagrangé, in his turn adopting all the ameliorations made by his friend, has come in second. Neither the one nor the other is a man of many words, but they have both, in conversation, described the sensation of gliding through the air. It has fascinated both to such an extent that nothing in the world could induce either of them to abandon the study of the "heavier than air," with which they hope to make long journeys before many years are out.

To encourage them in their enterprise there are plenty of prizes more or less officially offered. The list of them published

here reaches a total of some £60,000, but the biggest are quite beyond the reach of the present aeroplanes, on account of the unreliability of even the best of the existing light motors. For instance, the last project started by M. Georges Dubois, a member of the Aero Club of France, is not tempting. M. Dubois has opened a subscription for a handsome prize to be awarded to the first man who, on a machine heavier than the air, without any gas-bag, shall rise in the air to the height of 25 metres (82 feet)—that is to say, to something like double the height of an ordinary Paris house. With the present motors the flying man shows his skill by keeping comparatively low, because he knows that if the motor should fail when at any considerable height the result would be disastrous. In the case of the motor stopping when at the altitude of 82 feet the flying man could not avoid a catastrophe for himself and his machine, which would fall to the ground and be shattered to atoms. To attempt such an undertaking with the present motors would be foolhardy.

THE publication of the text of M. Barthou's Bill "concerning the penalties to be inflicted for the infringement of the automobile traffic regulations" has but increased the strength of the agitation against the proposed measure. It shows that the summary published last week did not exaggerate its vexatious character, and that if, to imagine the impossible, it were to be adopted by the Chambers as it stands, it would be a very serious blow to the automobile industry in France. The preamble to the Bill has raised a storm of indignation. In it the Minister of Public Works tells the owners and drivers of motor-cars that he does not think the police and gendarmes can any longer suffice to detect their misdeeds. He has, therefore, decided that every functionary having anything to do with the roads, or whose work calls him on them, shall have the power and duty to stop motor-cars and legally note every infringement of the automobile traffic regulations. M. Barthou presses into this spying service "the engineers, their assistants, the highway inspectors, the chiefs of gangs of road labourers, and all the other commissioned employees of the Posts et Chaussées department, the forest guards, the custom house officers, the Government tax-collectors, the collectors of town dues, and the officials occupied with public weighing machines." No one but the postman is excepted. This enumeration shows the spirit which evidently inspired the author of the Bill. All who are acquainted with France will understand that under such conditions the life of a country gentleman owning an automobile would be unbearable. If he failed to keep on good terms with all the people, without exception, instructed by Government to watch him, he would be prosecuted for imaginary infringements of the regulations every time he appeared on the road in his car. The probability is he would promptly sell it.

THE Dieppe circuit, over which the Automobile Grand Prix will be run in July, has already received the visits of most of the French competitors in the great race. Very few of them have the cars they will pilot on the occasion, but they are studying the road, of which, before the date of the contest arrives, they will know every stone. If their English competitors follow their example, I advise them to drive through Criel sur Mer, a little hamlet of about 900 inhabitants, with special care and at a low speed. It is not that the road there is dangerous, but because the gendarmes of the place seem to take pleasure in annoying the automobilists. There is scarcely a man who has tried the Dieppe circuit during the last three weeks who has not been stopped by them to learn he will be prosecuted either for furious driving or for the number of his car being invisible under a layer of dust adhering to it by oil or grease, which those gendarmes always say has been plastered on it on purpose to conceal it. The amiable character of those functionaries of the Republic is illustrated by last year's statistics, which show that of the 300 infringements of the regulations noted on the Dieppe circuit in 1907, no fewer than 250 were detected by the vigilant eyes of the Criel-sur-Mer gendarmes.

MARNEY.

CONTINENTAL NOTES.

Encouraging the Development of the Small Car.

With the view of encouraging motor-car manufacturers to devote greater attention to the production of reliable vehicles at a moderate price, Baron Pierre de Crawhez, the chairman of the Sporting Committee of the Belgian Automobile Club, is offering a cup for a competition of vehicles, the chassis price of which does not exceed £200. The details of the competition will be announced later.

An Austrian Light Car Reliability Trial.

The Austrian Automobile Club is organising a reliability trial of light cars for the 18th, 19th, 20th and 21st June next. The competitors will be divided into four categories, viz.: (1) single-cylinder cars up to 100 mm. bore, (2) ditto up to 130 mm. bore and double-cylinder up to 90 mm. bore, (3) two-cylinder

best time of the day was made by Ragusa on a Darracq, who covered the distance in 35 3-5 sec. A flexibility trial, confined to six-cylinder cars, was afterwards held, this being won by Massie on a Berliet.

German Motor-Car Imports and Exports.

The imports of foreign motor-cars, both of the pleasure and industrial type, into Germany during January last attained a value of only £28,696, as compared with £57,331 in the first month of 1907. On the other hand, the exports of motor vehicles of German manufacture during the same period increased from £37,295 to £37,804.

Miscellaneous Items.

A motor-bus service is being started between Saarburg and Dagsburg, Germany. A start will be made with three Scheibler

Motoring in Montenegro.—A snapshot at Nitrachik.

[Allgemeine Automobil Zeitung.]

cars up to 105 mm. and four-cylinder ditto up to 75 mm. bore, and (4) four-cylinder vehicles up to 85 mm. bore. The total distance to be covered is about 1,000 kilometres, the first day's run being from Vienna to Prague, on June 19 from Prague to Reichenberg, on June 20 Reichenberg to Tabor, and June 21 Tabor to Vienna.

Belgian Motor-Car Imports and Exports.

The imports of motor-cars and parts into Belgium during the two months ending with February last attained a value of £18,996, as compared with only £14,611 in the corresponding two months of last year. During the same period the exports of motor-cars and parts from Belgium advanced from £41,086 to £56,910.

Speed Trials at Nice.

A series of flying kilometre speed trials was held at Nice on Sunday last in connection with the annual automobile meeting at that popular resort. In the single-cylinder car class the best time—47 1-5 sec.—was made by Giuppone on a Peugeot. The

vehicles.—A new fuel for petrol motors known as "Rapidin" is being introduced in Germany.—The Danish Automobile Club is organising a reliability trial of touring cars, to be held on the 29th, 30th and 31st May next.—Prince Heinrich of Bavaria has acquired a 40-h.p. Benz car.—Thirty-nine entries have so far been received for the industrial vehicle trials to be held in France in May next.—It is estimated that there were 34,850 private motor-cars in use in France at the commencement of the present year.—A State motor-car service is shortly to be established between Bad Kissengen and Bruckenaun, Germany.—The entry list for the Prince Henry of Prussia Touring Competition is to remain open until April 15th, a fortnight longer than was at first arranged. The event itself will be held from the 9th to the 17th June next.—Count Scheremetzew, who owns several sugar factories in the neighbourhood of Moscow, has ordered three N.A.G. motor-vehicles, which are to be used for the conveyance of workpeople between the works and their homes.—A company has just been formed to introduce a service of motor-cabs in the town of Nantes.

LAST year 747 motor-cars were registered in the county of Middlesex.

THE Danlop Motor Tyre Sundries List for 1908 has just been issued.

MR. JOHN DUNCAN has been granted permission by the Perth Dean of Guild Court to erect a motor garage at Wellshill Terrace, Perth.

THE Scottish Automobile Company, Ltd., of Edinburgh, have just sold a 30-h.p. live-axle Daimler chassis, fitted with a Newnham carriage body, to Sir Robert Usher.

THE Frome's Hill climb having been frustrated by the action of the Bromyard authorities, will probably be succeeded by a trial on Cockshut Hill, near the picturesque town of Ledbury.

FOR motoring on the road at Dunsappie Loch, in Holyrood Park, Edinburgh, where such is prohibited, a driver has been fined 10s. For the defence, it was shown that he was unaware of the prohibition.

THE Elastes Company, Ltd., of 79-80, York Street, Westminster, have entered for a 3,000 miles Reliability Trial of Elastes-filled tyres and the Elastes movable flange. The tyres and rims will be fitted to an 18-h.p. Siddeley car.

MESSRS. BOULT, TAYLOR AND CO., LTD., of 12, Upper St. Martin's Lane, London, W.C., have changed their name to the St. Martin's Motor Works, Ltd. The business is being carried on as before and under the same management.

WE understand that the Legal Cases Committee of the Motor Union is sending a deputation to the Secretary of the Metropolitan Water Board with reference to the new scale of charges, to which we gave publicity in our issue of the 14th inst.

IT has been said that belt-driven cars were as dead as Queen Anne. It is, therefore, of interest to learn that the Brouhot Company, of Vierzon (Cher), France, are introducing a new 9-h.p. two-seated car in which the power from the engine is transmitted by a belt to the gear-box at the rear.

THE case of *Harris v. Du Cros*, in which the expensive luxury of running the ill-fated "Motorist and Traveller" was duly chronicled, resulted in judgment for the defendant—which seems well in accordance with the evidence and the public knowledge of Mr. Du Cros, whose abilities to speak for himself are generally recognised.

MESSRS. HARVEY FROST AND CO., LTD., have prepared for exhibition in the establishments of their agents a neat series of rubber patches illustrative of the various degrees of repair necessary in connection with their vulcanising system. These cases form an effective means of arresting public attention, and are being lent to enterprising firms in the leading towns of the country.

ARIEL MOTORS, LTD., inform us that they have abandoned altogether the manufacture of six-cylinder cars, and that they do not intend to make any more. They add: "Merit or no merit is not the point which we have considered in coming to this decision—it is a question altogether of public requirements. Four-cylinder cars of first-class make are so extremely good now, that the great mass of motor-car users have no wish to go in for the added expense and cost of upkeep of the six-cylinder car, and, therefore, for financial reasons we prefer to make four cylinders only."

THE Coventry Simplex Engines, Ltd., Coventry, recently fitted one of their 10-h.p. two-cylinder engines to a 6½-h.p. Humberette, and invited us the other day to a run on the same over a hilly road. A very neat job had been made of the conversion, it having only been necessary to remove a portion of one of the longitudinal tubular members and substitute an angle steel member, using the original flywheel and clutch. We drove the car over a hilly course, and were delighted with the smooth way in which the car ran. Notwithstanding the increased power, everything seemed to be well balanced. The clutch was not fierce, and the radiator quite satisfactory. The weight of the Simplex two-cylinder engine is about 10 lb. lighter than the old single-cylinder motor it has replaced.

THE motor-bus daily service between Kirkwall and Stromness has been resumed.

THE Percy Cycle Co., Ltd., have a well-equipped garage in Northumberland Street, Newcastle-on-Tyne.

THE Staines Motor Company have a garage in Staines, which has proved very popular during the past season or two. It is now making cars and is doing good local trade in that direction.

ON one of the stands at the Cordingley Show will be seen the "Sceptre" motorists' outfit, brought out by the City Manufacturing Company. This is a comprehensive and excellent addition to the things that should be in the motor house.

ONE of the most ingenious ball bearing joints for wind screens is the "Victor," brought out by Messrs. J. Neale and Sons, Ltd., of Neale Street, Birmingham. This is adjustable to the dozen positions indicated in the accompanying illustration. The locking of this joint is effected by four pins working on ball bearings which pass through the two plates of joint; when the lever is unlocked the pins are automatically thrown out of action during adjustment. Each position is definitely indicated by

"stop," enabling the user to adjust the screw in the dark and allowing the alteration of position to be effected without leaving the car. The rigidity of the joint is absolute, and when it is locked it cannot be made to move under any pressure or vibration. This joint causes no strain on the screen, as it does not separate or come apart during the adjustment. It is flat at the back, having no projections whatever, and should have great popularity in the trade.

AMONG the recent purchasers of Napier 40-h.p. six-cylinder cars are Sir Herbert Marshall and Mr. Henry Ballantyne, of Tweedvale House, Walkerburn.

FOUNTAIN'S Coach and Motor Company, Ltd., at 24A, The Grove, Ealing, W., is under the management of Mr. J. Fountain, assisted by Mr. S. J. Fountain. A special feature is being made of Cape cart hoods, glass wind screens, canopies, &c.

MR. S. F. EDGE is offering prizes to the drivers of Napier cars who show the minimum number of involuntary road stoppages in proportion to mileage covered during the six months ending with September of the present year.

ELECTRIC CARRIAGES will be admitted to Hyde Park during the months of May, June, and July. Licences for the same will be issued by the Commissioner of Works on written application to his office at Storey's Gate, Westminster.

The Cordingley Motor Show.

(Continued from page 70)

CORDINGLEY'S Motor-Car Show, which opened last Saturday, has been continued with much success throughout the whole of the week, the various sections with their automobile novelties attracting attention from press and public alike. Below we continue our report of the many specialities shown, as well of the cars on view.

The "Club" Car.

A finely-finished 24-30-h.p. landaulet is staged by Mr. A. E. CREESE, of East Dulwich. The vehicle, to which the name "Club" has been given, is of French construction, being built by Messrs. Brouhot and Co., of Vierzon. The cylinders of the four-cylinder engine are cast in pairs, and have the valves operated off a single cam shaft. The carburettor, which is provided with a hot-water jacket, is of the automatic type, while the ignition is by low tension magneto. The

lines, being fitted with pressed steel frames, push pedals, framed ribbed-tube radiators, and transmission by cardan shaft and bevel gear on to a live axle. Prominence is given to the No. 8 two-seated model, which since its introduction a few months ago has met with considerable success. The car is built on the lines of a miniature racer, the seats being placed well back, and the steering inclined at a sharp angle. The bonnet is of such a length that it covers not only the engine, but also the clutch and gear-box, rendering these parts extremely accessible. The motive power is supplied by a De Dion 8-9-h.p. single-cylinder engine of the latest type, although, if desired, a 10-12-h.p. two-cylinder Aster or a 10-12-h.p. four-cylinder Amstutz engine can be supplied at an extra cost. The clutch is of the leather-faced-cone type; the change-speed gear is of the Renault pattern, giving three speeds forward, in addition to the reverse, with a direct drive on the top speed. The transmission is by a cardan shaft to a strongly-built live axle. Other models on view include an 8-9-h.p. double phaeton and a four-seated dog-

General View of the Exhibition.

lubrication of the motor is controlled by a pump, which forces the oil from the tank through a sight-feed lubricator on the dashboard. The control is by two levers on the steering wheel, one actuating the ignition and the other the quantity of mixture passing to the cylinders, the latter also varying at the same time the amount of petrol allowed to pass through the jet. Other features of the vehicle include the clutch, which is of the cone type, the male portion being built in halves, so that it can be readily detached. The gear-box is adapted to give four speeds forward and a reverse with direct drive on the top speed to a differential shaft, and thence to the rear road wheels by side chains. Mr. Creese is using as a trial car a 10-h.p. four-cylinder taxicab, also made by Messrs. Brouhot. This car is of the cardan shaft, live-axle variety, and is fitted with a Renault type gear-box giving three speeds and a reverse. The vehicle is of very sound construction, and well adapted for the rough work motor-cabs are called upon to perform.

The Jackson Cars.

One of the exhibits appealing particularly to the motorist of moderate means is that of Messrs. R. REYNOLD JACKSON AND Co., who have a large range of the Jackson cars on view. They are all on modern

cart of the same power, both being fitted with De Dion single-cylinder engines. The dogcart has been considerably improved in several of the details. The wheel base is longer, enabling a more roomy body to be provided; the latter is now provided with a curved back in place of the somewhat stiff lines formerly adopted. The seats are made detachable, so that the car can be made to serve a double purpose—that is to say, it can be used both for pleasure and also for delivery purposes. Throughout the Jackson car is on modern lines, the frame being suspended on five springs, while other up-to-date fittings include long push pedals, throttle control above wheel, and a combined fan-cooled radiator and water tank.

The "Belgica" Cars.

The LONDON AUTOMOBILE SUPPLY COMPANY, who have secured the sole agency for Great Britain and the Colonies for the "Belgica" cars, built in Belgium by the Usines de Saventhem, have an excellent display of these vehicles, which are shown in this country for the first time. The *piece de resistance* of the stand is the polished 58-h.p. six-cylinder chassis, of which we give an illustration in Fig. 12. The frame is of pressed steel, of deep section; it is narrowed at the front to give a wide steering lock, and raised at the rear to give clearance for the

differential casing. The chassis is carried on four long springs, those at the rear being of the three-quarter elliptic type. The engine, which comprises six cylinders, is supported directly on the main frame, the sides of the base chamber being extended to form a mud shield. The cylinders are cast in pairs, with the valves located on opposite sides. The bore and stroke are respectively 125 mm. by 140 mm. The carburettor, which is of the automatic type, has a throttle provided with both hand and foot control. The main ignition is by a low-tension

with direct drive on the top speed. The final transmission is by a cardan shaft and bevel gear to a live axle. The latter, like the gear-box, runs on ball bearings; it is provided with a central torque rod of pressed steel and two side radius rods. The power is transmitted to the road wheels through the axle ends, the wheels themselves being mounted on the axle casing. The brakes are of the internal expanding type, and we note that the usual method of control has been reversed, the hand lever actuating the brake behind the gear-box and the pedal,

Fig. 12.—Chassis of the Belgica 58-h.p. Six-Cylinder Car.

magneto. The cam-shaft actuating the make-and-break mechanism is located at the upper ends of the cylinders, and is driven by an inclined shaft at the dashboard end of the engine and operated off one of the half-time shafts. The cams on the overhead shaft actuate little spring-loaded bell-cranks, which in turn engage and release the rocking pieces of the plugs. A single naked brass wire conveys the current to all the plugs from the magneto. High-tension accumulator ignition is also

these working in drums on the rear wheels. A complete six-cylinder car, equipped with a double-phaeton body by Van den Plas, with hood and front glass to the rear seats, forms a striking vehicle. A 38-h.p. four-cylinder vehicle, with limousine body, is also on view. With the exception of the number of cylinders, this is identical as regards the chassis with the 58-h.p. car above described. A further "Belgica" model is seen in a 28-h.p. four-cylinder chassis. Generally speaking,

Fig. 13.—Chassis of the New Leader 10-12-h.p. Car. (See page 97.)

fitted as an auxiliary, a distributor being mounted on the upper end of the inclined shaft above referred to. The water circulating pump is gear driven; it works in conjunction with a honeycomb radiator, a current of air being drawn through the same by the flywheel, the arms of which are formed so as to act as a fan. The clutch is of the multiple disc type; an enclosed joint is provided between it and the gear-box to allow for any want of alignment between the two parts. The change-speed gear is "gate" controlled, and is adapted to give four speeds forward

this is on the same lines as the others. The cylinder dimensions are, however, 105 mm. by 130 mm. A high-tension magneto takes the place of the low-tension one on the more powerful cars, while the flywheel fan is replaced by a belt-driven fan immediately behind the radiator. There are many points of interest in the new "Belgica" cars, notably the attention which has been paid to the accessibility of the various parts and to the lubrication and protection from dust and dirt of those components subject to wear.

The New Leader Cars.

The HIGH HOLBORN MOTOR AGENCY are present with several examples of the 10-12-h.p. New Leader two and four seated cars. The motive power is supplied by an engine comprising four separate cylinders, 90 mm. bore by 90 mm. stroke; the valves are operated off a single cam shaft, and the water circulation is on the thermosiphon system. The transmission is through a leather-faced cone clutch, three-speed gear-box, cardan shaft and bevel gear to a live axle. The gear-box is provided with roller bearings and ball thrusts; the dashboard is of a special curved type, forming the petrol and oil tanks, and carrying the coil and sight feed lubricators; this arrangement insures a constant supply of petrol to the carburettor when ascending steep gradients. An 18-22-h.p. two-seated Victoria, with hood and front glass screen, is also on view. This is on similar lines to the vehicle described above, except that the water circulation is by pump. A noticeable feature is the special form of the front mudguards, which extend vertically from the frame at the side of the wheels as well as over the latter. A new model is seen in a 12-16-h.p. two-seated car, in which the valves are situated on opposite sides of the cylinders.

The Reo Cars.

One of the largest stands in the Exhibition is that of REO MOTORS, LTD., Westminster. We first inspected the 10-h.p. vehicle, which can be supplied with either two or four seated bodies, the rear seat being ingeniously made to fold up when not in use. The engine, which is

Messrs. Lambie and Sharp (Reo Motors, Ltd.).

set about the centre of the frame, is of the single-cylinder horizontal type, the bore being $4\frac{1}{2}$ in., the stroke 6 in., and the normal speed 800 revolutions per minute. The ignition is by coil and accumulators, the advance and retard being controlled by a lever on the steering column. The water circulation is by a positive gear-pump and tubular radiator. The change-speed gear, which is of the epicyclic or planetary type, is adapted to give two speeds and a reverse, the latter being actuated by a pedal; the gear is mounted on an extension of the crank shaft, a single chain transmitting the power to the rear live axle. The axles are of tubular construction, and fitted with roller bearings. Double elliptic springs are employed at the rear, and three-quarter at the front. Several examples of the Reo 18-20-h.p. car are on view, these including a handsomely-finished landaulet, a taxicab, and a five-seated touring car. In these larger vehicles the engine is of the horizontal opposed double-cylinder type, the bore and stroke being respectively $4\frac{1}{2}$ in. by 6 in., the transmission being similar to that referred to above. A dashboard of the curved type is fitted to the car (Fig. 14). Prominent among the 18-22-h.p. cars is the "Flying Greyhound," a touring model, designed specially for speed and as a two-seater, and fitted with a box trunk at the rear, which may be converted into an emergency or third seat. The engine is similar to the standard 18-22-h.p. car, but with certain improvements in detail. It has two horizontal opposed cylinders, located somewhat more to the rear than usual, with the object of evenly distributing the weight on all four wheels, thus ensuring comfort and causing the car to ride sweetly over rough roads. A somewhat unique hood is provided; this, while only covering the two front seats,

is made on the same principle as the usual hood, which has an extension piece in front, which causes the front support to be perpendicular, and overcomes the otherwise difficulty of obtaining access to the car. In hot climates the hood can be used as a sun screen, the back portion being then rolled up to allow the air to pass freely, while the further provision of side curtains and a folding transparent screen ensure the protection of the occupants in wet weather. The road wheels are of larger diameter than hitherto—viz., 32 in. instead of 30 in. A new type of silencer is fitted, which includes a "cut-out," so that in the country

Fig. 14.—The Reo 18-22-h.p. Car.

greater power can be obtained. The tyres fitted to all the cars are of the Goodyear type, which are noticeable for the ease with which they can be detached without the use of tools. The Reo cars have an excellent reputation for their quiet running and hill-climbing qualities, and, in view of their relatively low price, are finding a steadily enlarging clientele in this country. Apart from the cars, the Reo Company are showing a new combined speed indicator and mileage recorder, known as the Hicks. This is a neat and effective device made in two patterns, one showing speeds up to fifty miles and the other up to seventy-five miles per hour. Attention may also be drawn to the range of Hildreth marine motors to be seen at this stand. These engines, which are of American design and manufacture, are of the two-

Fig. 15.—Chassis of Reo 18-22-h.p. Car

cycle type; they are made in a number of sizes, including 5-h.p. single-cylinder, 7-h.p. double-cylinder, and 10-h.p. three-cylinder.

Freeland's Non-Skid.

Among the non-skid devices embodying special features is that shown by Mr. G. FREELAND, 63, Quarry Hill, Tonbridge, Kent. In this the treads are replaceable when worn—a means to economy which will doubtless be generally appreciated. The studs are inserted in the leather band, which is isolated from the cover by the usual rubber. The head portion is screwed into the metal piece going through the band, and any of the treads can be taken out and replaced with ease.

The "Turicum" Cars.

One of the novelties of the Show is undoubtedly the "Turicum" friction-driven light car exhibited by the VOITURETTES "TURICUM," of 19, Avenue de la Grande Armée, Paris. Apart from the friction drive, the vehicles comprise a number of novel features. Fig. 18 shows respectively an elevation and plan of the chassis. The motive power is supplied by a 6-8-h.p. single-cylinder engine (Fig. 17), air-cooled in an ingenious way. The cylinder is enclosed in a sort of cowl, in the front part of which is mounted a fan belt driven off the engine. By this means a powerful current of air is drawn through the perforated metal front, which takes the place of the usual radiator, and circulated round the engine. The ignition is effected by a chain-driven low-tension magneto, with simple make-and-break mechanism. The usual clutch and change-speed is replaced by a friction drive by which any speed

Fig. 16.—The Rco 18-22 h.p. "Flying Greyhound." (See page 97.)

between zero and twenty-five miles per hour can be attained. The engine shaft is extended to about the centre of the car, and terminates in a large disc. Mounted on a cross shaft at right angles thereto is a second disc, the periphery of which is leather covered, and by a pedal is brought into contact with the engine disc. The cross shaft is of square section, so that by means of a side lever the position of the friction disc in relation to the engine disc can be varied, the speed increasing as the point of contact is brought away from the centre towards the outer edge, while if the disc is moved along its shaft beyond the centre of the fixed one a reverse motion is obtained. The cross shaft is mounted in a ball bearing at one side, and in a slide at the other, in such a way that by means of a pedal it can be moved slightly to the rear, and the contact between the two discs is broken whenever it is necessary to change speed. A single side chain conveys the power from the cross shaft to the rear live axle. The frame of the vehicle is of ash, with steel fitch plates; the road wheels are of the artillery type, with tubular steel spokes; the four springs above the axles of the car are

Fig. 17.—The Turicum Air-Cooled Engine.

also extremely novel, in that they are each absolutely circular. They consist simply of a series of thin steel strips placed one above the other, the whole formed into a circle, having an overall diameter of about 12 inches. The exhibits comprise a chassis, the gear of which is shown in motion, a two-seated car, and a light delivery van for loads up to 8 cwt. The cars only weigh about 7 cwt., so that they should be

economical in tyres. The Turicum Company also show a side-entrance double phaeton, fitted with the same system of transmission, but having a 12-h.p. four-cylinder engine, the four cylinders being cast in one block and water-cooled. As in the 6-8-h.p. car, the crank shaft runs on ball bearings, while an ingenious form of automatic throttle is provided on the admission pipe to prevent the engine racing. When m

Fig. 18.—Elevation and Plan of Turicum Friction-Driven Voiturette.

Paris in December last we had an opportunity of testing one of the 12-h.p. vehicles, and were struck not only with the speed it attained, but with the general ease of control. We may add that the friction discs are entirely protected, so that the efficiency of the drive is not affected by dust or dirt. The cars are being put on the market at a

Fig. 19.—The Turicum Light Delivery Van.

relatively low price, and in view of their absence of complication are attracting considerable attention. The company are well aware that the friction drive has been tried before, but claim that they have overcome the difficulties associated with it, and that, having subjected their vehicles to most severe tests, they have every confidence in placing them on the English market.

The New Pick Cars.

As sole concessionaires for the "New Pick" Motor Company, of Stamford, the EARL'S COURT MOTOR AND GARAGE COMPANY, LTD., exhibit for the first time examples of the New Pick two and four seated cars, which are attracting considerable attention. The reason for this is found in the fact that they are probably the cheapest four-cylinder vehicles on the market. At the same time, the makers claim that every care is taken in the construction and in the selection of material. The frame is of pressed steel, suspended on five semi-elliptical springs. The engine is of the four separately-cast cylinder type, $3\frac{1}{4}$ in. bore by

Fig. 20.—The New Pick 14-16-h.p. Two-Seated Car.

4 in. stroke, the valves being actuated off separate cam shafts. A simple form of automatic carburettor furnishes the mixture, while the ignition is by coil and accumulator. A gear-driven pump circulates the water for the cooling of the engine through a framed ribbed tube radiator. The speed of the engine is controlled by a small foot lever. The clutch is of the cone type, fibre being used in place of the usual leather, the material being claimed to give all the advantages of a metal clutch. The transmission is through a three-speed gear-box, cardan shaft to a live axle, provided with ball bearings. The steering is of novel design: a bracket is attached to the front axle and serves to carry the shaft of a pinion, which acts upon a rack connected

and is lubricated from the dashboard, the surplus oil passing to the timing gear. The water circulation is on the thermo-syphon system, no pump being employed. The ignition is by Nilmelior high-tension magneto. Both hand and foot control of the throttle is provided. The lubrication of the engine is effected by pressure, the oil reservoir being fixed on the engine side of the dashboard. The clutch is of the leather-faced cone type, a peculiarity of the design being that the male portion is in two halves, allowing the leather to be easily renewed when necessary and without disturbing the gear-box. The latter is connected with

Fig. 21.—The Vivinus 20-24-h.p. Car.

the engine base chamber by an aluminium casing, which serves as a shield to the clutch, and at the same time secures the alignment of the two parts. The change-speed gear is adapted to give three speeds forward, with a direct drive on top speed. The control is by a single lever working in a "gate" quadrant. The final transmission is by a cardan shaft and bevel gear to a well-supported live axle. The foot brake is not located behind the gear-box as usual, but on the small bevel pinion shaft at the rear of the cardan shaft. The 20-24-h.p. Vivinus car varies in several details from the 16-20-h.p., the motor having four separately-cast cylinders, 98 mm. bore by 116 mm. stroke, with the valves arranged on opposite sides. The lubrication is by a

Fig. 22.—Chassis of Vivinus 16-20-h.p. Car.

to the front steering rod. The action from the steering wheel to the pinion shaft is communicated by means of a universally jointed shaft. The car is exceedingly light, as well as economical, the petrol consumption working out at twenty-eight miles to the gallon.

The Vivinus Cars.

A Belgian-built car, which has long had an excellent reputation in this country, is the Vivinus, the agency for which is now in the hands of the VIVINUS AGENCY COMPANY, LTD., of Sydney Street, Chelsea, S.W. Prominent on the stand is a chassis of the latest model, a 16-20-h.p. four-cylinder car (Fig. 22). The cylinders are cast in pairs, with the valves all located on one side. The bore and stroke is respectively 90 mm. by 110 mm. The cam shaft is enclosed in a separate case,

mechanical pump forcing oil to a series of sight feeds on the dashboard, the surplus being returned to the tank by a tap-controlled by-pass. The body-work at this stand is worthy of close attention. The complete cars on view include a 20-24-h.p. side-entrance double phaeton by Snutsel, of Brussels, this being fitted with a Capt-cart hood and patent wind screen; and a 20-22-h.p. car with landaulet body by Million-Guiet.

The Unic and Brasier Cars.

The display of Messrs. MANN AND OVERTONS, LTD., includes examples of the latest types of the well-known Unic and Brasier cars, for which they are British agents. Of the first-named vehicles those on view include a 10-12-h.p. cab, similar to those now running in large numbers in London, a 16-20-h.p. landaulet, and a 24-30-h.p. chassis.

The 10-12-h.p. vehicle has already been described in the *M.C.J.*, so it will suffice to mention that the engine comprises two cylinders, 102 mm. bore by 110 mm. stroke, and that the transmission is through a leather clutch, a ball-bearing gear-box giving three speeds and a reverse, and a direct drive on the top through a cardan shaft and bevel gear to the rear live axle. As regards the 16-20-h.p. vehicle, the four cylinders of the motor are cast in pairs, with the valves on opposite sides; the bore is 87 mm. and the stroke 110 mm. Several alterations have been made in the new model; for example, the low-tension magneto system

Fig. 23.—The Unic Taxi-Cab.

has been superseded by a high-tension magneto. The carburettor is of a simple automatic type, which has proved very economical as regards fuel consumption. The auxiliary air supply is regulated by the action of the suction of the engine on a mushroom valve, and in order to avoid an irregular movement of the valve, the end of the valve stem is fitted with a piston, which works in a cylinder filled with glycerine. The throttle is of the sliding piston type, and is fitted over the carburettor. The clutch is of the leather-faced-cone pattern, and a joint is introduced in the shaft connecting it with the gear-box. The gears can be arranged to give either three or four forward speeds and a reverse, and the control is by a "gate" lever. The transmission is by a cardan shaft to the back axle, which is of solid construction, and fitted with ball-bearings, besides being protected from road shocks by two stout tension rods. The speed of the engine is regulated by a hand lever on the steering wheel. This lever controls the throttle only, and has no effect on the

oil to travel through it to the big end bearings of the connecting rods. An arrangement is fitted so that the throttle is automatically closed when the clutch is thrown out, thus avoiding any racing of the engine when changing speed. The transmission is on the Unic standard lines, the main alteration in this model being the adoption of a metal-to-metal disc clutch (Fig. 24) running in oil. Turning now to the Brasier cars, those on view include a 16-20-h.p. side-entrance double phaeton, a 30-40-h.p. chassis, and a touring car with Vincent body of the same power. The four cylinders of the 24-30-h.p. engine are cast in pairs,

Fig. 24.—Sectional View of Clutch of Unic 24-30 h.p. Car.

with the valves all arranged on one side, the dimensions being 112 mm. bore by 130 mm. stroke. The crank shaft is *desaxé*—that is to say, it is slightly out of line with the centre of the cylinders. Ignition is by low-tension magneto, the operating shaft being located overhead, with the strikers so arranged that each may be taken out independently of the others. The carburettor is of the automatic type, the additional air supply for the mixture being regulated automatically by means of a small conical valve. The leather-faced-cone type of clutch is retained, a double-jointed shaft connecting the clutch with the gear-box. The latter

Fig. 25.—Chassis of Unic 24-30-h.p. Car.

ignition. On the other hand, the foot accelerator controls both throttle and spark, an arrangement which is also fitted on the 24-30-h.p. car. The 24-30-h.p. Unic is an entirely new model. The four cylinders (102 mm. bore by 116 mm. stroke) are cast in pairs, while the valves are arranged on opposite sides. The carburettor is of the same design as that on the 16-20-h.p., while the ignition is by a high-tension magneto, this being mounted upside down with a view to economy of space. The lubrication of the crank shaft bearings is effected by means of a pump in the base-chamber; the crank shaft is hollow, allowing the

is adapted to give four speeds forward and a reverse, with single operating lever working in a "gate." On the top speed the drive is direct to the differential shaft, from which the power is conveyed to the rear road wheels by side-chains. Ball bearings are fitted to all parts except the engine.

The Empress Cars.

THE EMPRESS MOTOR COMPANY, LTD., of Manchester, whose cars are already well known in the North, bring their vehicles to the notice, for the first time, of motorists in the South of England. Four

models are being made, viz., 16-20-h.p. and 20-24-h.p. four-cylinder, and 24-30-h.p. and 30-36-h.p. six-cylinder, and, while following, in general design, the usual lines of chainless cars, the details bear evidence of careful thought, while, as regards material and construction, these are, we are assured, of the highest grade. Only two models are on view—a four-cylinder 16-20-h.p. side-entrance double phaeton and a 24-30-h.p. six-cylinder landaulet. As regards the chassis, practically the only difference between the two is the addition to the engine of an additional pair of cylinders, the bore and stroke for both cars

Fig. 26.—The "Empress" 16-20-h.p. Car.

being 90 mm. and 127 mm. respectively. The cylinders are cast in pairs, and have the valves all operated off one cam shaft. As will be seen from Fig 27, large inspection doors are provided in the base chamber, while the bottom half of the latter can be removed, without interfering with the crank shaft bearings. A separate pipe from each cylinder conveys the exhaust gases to a collecting chamber, from which they pass to the silencer proper. The mixture is furnished by the Perfecta carburettor, devised by Mr. Smith, and an illustrated description of which has already been given in the *M.C.J.* Both foot and hand control of the throttle is provided, the arrangement being such that the pedal acts as an accelerator. When the pressure on it is released the speed of the engine falls to that permitted by the position of the hand lever on the steering wheel. Two systems of high-tension ignition are provided—magneto and accumulator. The magneto is

through the bonnet. A noticeable feature of the cars is the "clean" dashboard, the only fitting on it being the switch. The lubrication of the engine is effected by a positively-driven apparatus located below the front floorboard. The clutch is of the internal leather-faced cone type, provided with three large ball thrust bearings. The gear-box, which is adapted to give three speeds forward and a reverse, is provided with large circular shafts, running on ball bearings, and having

Fig. 27.—The "Empress" 16-20-h.p. Engine.

four projecting keys engaging with keyways of similar size in the pinions. The final transmission is through a propeller shaft and bevel gear to a live axle. The cardan shaft, which has only one joint—at the forward end—is enclosed in a casing, which acts as the torque rod, and which is provided with a ball bearing at each end. The differential gearing is of great strength, and equipped with four pairs of spur pinions instead of two, as is usual. These pinions are made solid

Fig. 28.—Chassis of "Empress" 16-20-h.p. Car.

located on the right side of the motor; the shaft which drives it is extended in the opposite direction to operate the water-circulating pump, which latter can readily be detached when necessary. The radiator is of the honeycomb type, while the flywheel of the engine has vanes cast on its periphery to act as a fan in drawing a current of air

with their pivots, which work in hardened steel bushes in the differential casing. The whole of the differential gear revolves in ball bearings mounted in the axle casing, and these bearings may be adjusted from the outside of the axle, the adjustment not interfering with the two sleeves extending outwards and carrying the road wheels. The axle

shafts run on double row ball bearings, and both these shafts and their ball bearings can be withdrawn without disturbing the differential gear. The road wheel hubs are mounted upon the taper ends of the axle shafts, which latter are provided with four keys formed solid with the shaft, thus obviating the employment of loose keys. The whole axle may be removed from the car by removing four screws, and

Fig. 29.—The 45-h.p. Mercedes with "Reading" Single Phaeton Body and Victoria Hood, exhibited by Mr. William Vincent, Reading.

without disturbing the springs, spring clips, or cardan-shaft joint. Ball bearings are fitted to all parts except the engine. The foot brake is interchangeable with the hand-operated ones on the rear wheels. The latter are provided with an ingenious compensating arrangement, which equalises the pull. A special feature of the cars is that the road wheels are all detachable from the hubs and interchangeable with each other. Thus the system gives the motorist the option of repairing the tyre

of channel steel is employed to support the engine and gear-box. Mr. Frank Smith, the designer of the "Empress" vehicles, is a firm believer in the subsidiary frame, considering that it ensures absolute alignment of the engine and gear-box, besides making the *chassis* several times stronger without adding weight; this increase of strength is due to the metal of the *chassis* being disposed in two planes, giving the complete frame the form of a beam of considerable depth. The usual set of four longitudinal springs is supplemented by a transverse one at the rear. The 16-20-h.p. car has a wheel base of 9 ft., while that of the 24-30-h.p. is 10 ft. 8 in., enabling any form of closed or open body to be fitted to the *chassis*.

Vincent's Motor Bodies.

An elaborate display of modern motor-body work is made by Mr. Wm. VINCENT, of Reading. Prominent on the stand is the 45-h.p. Mercedes car, shown in Fig. 29. This is undoubtedly one of the most striking vehicles in the show. It is fitted with what is known as a "Reading" single phaeton body, sloping back, Victoria hood, and folding glass screen. The car is painted in two shades of green, and upholstered in sage-green leather, the whole forming a speedy and luxurious touring vehicle. Another handsome vehicle is a 50-h.p. Florentia chain-driven car fitted with a seven-seated limousine. The body is painted in two shades of green stripes, relieved with red lines, the upholstery being in pearl colour French cloth, the *tout ensemble* being extremely pleasing. A third car on view is a 16-h.p. Brasier. This has a five-seated Tulipe double phaeton body, painted in Dutch green and cream lines, with cream under-frame, and upholstery in bright chrome leather. Other exhibits at Mr. Vincent's stand include a single landaulet body, painted carmine, upholstered scarlet, with real ivory fittings; a single landaulet body, painted light green, upholstered leather; a double landaulet body, painted dark green, upholstered in French cloth, and two unfinished bodies, a limousine and a Parisian four-seated phaeton, unfinished, to show the construction. An interesting novelty at Mr. Vincent's stand is the Reading patent wind and storm screen. This is quite a new idea in devices of this type, some of its features being the entire absence of glass and the facility for readily folding it up out of the way when not required. Fitted to the top of the dash is a metal frame, which carries a spring-actuated roller, while below

Fig. 30.—Chassis of "S.M.B." 20-h.p. Car (Union Motor-Car Company). (See page 103.)

in position or replacing the wheel by the spare one carried. It is also sometimes desired to transfer worn tyres on the back wheels to the front wheels. With the "Empress" arrangement the complete change can be effected in ten minutes by simply removing the wheels bodily, without recourse to changing the tyres on the rims. The main frame of the vehicle is of pressed steel, while a subsidiary one

it is a collapsible metal frame. The latter can be opened out any desired distance to the maximum of about 18 in. On the roller is mounted a screen of waterproof material extending the full width of the car. When required, the frame is adjusted to the right height and angle—facilities for adjustment being provided—and the screen pulled out and attached to the top of the frame, the arrangement form-

ing a complete protection to the driver. Any rain which collects on the screen finds its way to the bottom, where two small channels convey it to the sides of the dash, whence it falls into the road.

The S.M.B. Car.

An Italian car, new to this country, is the S.M.B., made by the Societa Meccania Bresciana of Milan, and exhibited by the sole concessionaires, the Union Motor Car Co., 21, Denbigh Street, Victoria, London, S.W. Fig 30 gives a view of the 20-h.p. chassis exhibited, from which it will be seen that the design is on thoroughly up-to-date lines, and forms a new addition to the list of high-grade cars turned out in Italy. The engine comprises four cylinders cast in pairs, the bore being 100 mm., the stroke 110 mm., and the normal speed 1,200 revolutions per minute. The valves are located on opposite sides, and operated off separate cam shafts. The ignition is effected by an Eisemann high-tension magneto, and the carburettor, which is gravity fed, is of a special balanced automatic type. The water circulation is maintained by a gear-driven pump and a honeycomb radiator with air-inducing fan, the latter being mounted on a special bracket, provided with a spring which keeps the driving belt at the requisite tension. The speed of the engine is controlled by a pedal, which varies the lift of the inlet valves by altering the position of the cams. The lubrication of the engine, and, in fact, all parts of the mechanism, is effected by a novel design of valveless pump driven by an eccentric off the crank shaft. The main oil reservoir is carried under the floorboard, the only fitting on the dash being a gauge, which indicates whether the oil pump is working or not. The clutch is of the single metal-to-metal disc type, and runs in oil. The change-speed gear, which is controlled by a special design of "gate" lever, gives four speeds forward and a reverse, with direct drive on the top. The final transmission is by a double universally-jointed propeller shaft and bevel gear to a live axle, which, like the gear-box, runs on ball bearings. The brakes are of the metal-to-metal internal expanding type, a point of interest being the compensating device employed in connection with those on the rear wheels; this consists of a miniature differential gear on the cross bar, which renders it impossible for the two brakes to act other than equally. The wheel base of the chassis is 9 ft. 2 in., while the track is 4 ft. 4 in., enabling any type of body to be fitted. An S.M.B. 20-h.p. four-cylinder marine type motor, complete with reversing gear, is also on view. The engine, which has the valves arranged on opposite sides, has cylinders 105 mm. bore by 130 mm. stroke, and runs at a normal speed of 800 revolutions per minute; it is fitted with low-tension magneto ignition, and a carburettor designed to work with either petrol, paraffin, or alcohol. The Union Motor Car Co. are also exhibiting the "Sceptre" motor cleaning outfit, and a new series of acetylene lamps and generators made by Messrs. Troubetzkoy and Co., of Milan. The new generator has been devised with the view of obtaining a production of gas, with even pressure, from the moment of lighting to the complete consumption of carbide. This is obtained by an apparatus in which the water which is to generate the gas and is regulated by hand, by means of a valve, is drawn from a tank, the level of which remains invariable during the entire function. To this end the water tank of the generator is divided into two parts, the first of which furnishes the water to the carbide, and the second supplies with water the first as this drops it on the carbide. Other advantages claimed for the system are:—(1) The production of gas can be interrupted and the generator stopped from working when the light is not required, thus obtaining a considerable economy of carbide. (2) The taking apart of the apparatus and recharging the charge of carbide can be done rapidly and simply, without the aid of any tools. (3) The generators of two and three elements are arranged so as to work either separately or simultaneously. Besides, either of them can be re-charged while the others are working, and without their light being put out. (4) Once the generator is furnished with carbide and with water, it can be set working at any time, even several days after, without the carbide deteriorating in any way.

The Royal and Imperial Starling Cars.

Among the exhibits of popular-priced cars worthy of notice is that of the STAR CYCLE COMPANY, LTD., of Wolverhampton, who have for some years been devoting special attention to the requirements of motorists of moderate means. Attention may first be drawn to the "Royal Starling" cars, of which several are on view, including a four-seated side-entrance car (Fig. 31), a similar car with hood and front glass, a two-seated touring vehicle, and a two-seated car with sample chest attached. The chassis (Fig. 32) of all four are identical, and an examination shows it to comprise all the main features of larger vehicles. The engine, which is rated at 10-h.p., comprises two vertical cylinders, 3½-in. bore by 4½-in. stroke, the valves being all mechanically actuated

off a single cam shaft. The arrangement of the inlet pipe is on somewhat novel lines. The carburettor is located on the right-hand side of the motor, and the gas is conveyed therefrom by an oblong section pipe between the two cylinders, and thence by a short vertical round pipe to the inlet valves. The latter are provided with a variable lift, by means of which the speed of the engine is controlled, this being obtained by a wedge piece which can be slid in and out between the cams and the valve tappets. The ignition is by coil and accumulators, the contact-maker being located in front of the car in an extremely accessible position. The water circulation is maintained by a gear-driven pump, with large radiator and fan. The transmission is through a leather-faced cone clutch to a three-speed and reverse gear-box, the shaft of which runs on Hoffmann ball bearings. The final drive is by a cardan shaft and bevel gear to a well-supported live axle, the latter

Fig. 31.—The "Royal Starling" 10-h.p. Four-Seated Car.

also running on ball bearings. The wheel base is of such a length as to permit a comfortable body to be fitted, access to the rear being through a swinging front seat. Altogether the Royal Starling is an interesting addition to the list of reliable small cars. The latest production of the Star Company is the "Imperial Starling" two-seated car. This is on similar lines to the 10-h.p., except that the motive power is supplied by an 8-h.p. single-cylinder engine of a bore and stroke of, respectively, 4½ in. and 4½ in. The frame of the chassis is of ash, strengthened with fitch plates. The transmission is through a leather-faced clutch, three speed and reverse gear-box, and bevel gear to a well-designed live axle. With artillery wheels and a neat two-seated

Fig. 32.—Plan of Chassis of "Royal Starling" 10-h.p. Car.

body, and sloping tool-box, it forms a useful production, and one that is steadily gaining in popularity.

Starting Device.

The F. H. SMITH ACCESSORIES, LTD., of Datchet, make a creditable first appearance with their pneumatic starting device, which also serves the purpose of detecting the cause of missing or want of power in an engine while running on the road. The fitment has its place on the dashboard, and consists of brass cap, in which is a push bottom, by means of which increased atmospheric pressure is put upon the petrol in the float-chamber through a flexible tube leading thereto. If the lack of power is from want of petrol the engine will at once show the increased power, because of the extra charge thus given. On the other hand, if the want of power or missing is caused from electrical faults, the engine power will not be improved—in fact an increase of petrol supply will tend to retard the engine if the charge was normal to commence with. The device is finely finished, and is easily fitted to any carburettor.

The Martin and Jellicoe Commercial Vehicles.

Messrs. MARTIN AND JELICOE, LTD., who have established works at Thames Ditton, Surrey, for the construction of industrial motor vehicles and motor components, make their bow to the public with a chassis of a 12-cwt. motor-lorry or van, which is noteworthy on account of its robust proportions. The 12-14-h.p. engine comprises two separately cast cylinders, 4½-in. bore by 5-in. stroke. The valves are operated off a single cam shaft, and the tappets, which are fitted with

Fig. 33.—The Martin and Jellicoe 24-28-h.p. Engine.

adjustable screw tops, work in phosphor bronze guides. The crank chamber is of aluminium, and fitted with large inspection doors on both sides; the lower half is so arranged that it can be removed without disturbing the main bearings. The crank shaft is forged from Vanadium steel, and runs in three phosphor bronze bearings of extra large proportions, giving excellent wearing surfaces. The cam shaft is so fitted that it can be drawn from the crank case without dismantling the engine, while the timing gear is completely enclosed in an oil-tight case. Ignition is by coil and accumulators, although provision is made for the ready installation of a magneto if desired. The contact-maker is located on the upper end of a vertical spindle driven by skew gearing off the cam shaft; the spindle is carried down to drive the Albany pump, which forces the water through the large jackets and framed ribbed tube radiator, with fan. The mixture is furnished by an automatic triple jet carburettor. The transmission is through a metal-to-metal clutch, four-speed gear-box, cardan shaft, and bevel gear to a live axle. A joint is introduced on the shaft between the clutch and gear-box to allow for any want of alignment between the two parts, and to allow either to be dismantled without disturbing the other. The change-speed gear, which runs on ball bearings, and gives a direct drive on the top speed, is fitted with a patent "gate" quadrant and lever, enabling each gear change to be effected by a full and positive stroke of the lever, the latter working on a fulcrum. The propeller shaft is provided with universal joints at each end, while the rear axle is of strong and substantial design, it being mounted on Hoffmann ball bearings in self-contained cages. The chassis on exhibition is fitted with pneumatic tyres to the front wheels, and solids to the rear; the wheel base is 8 ft. 6 in., enabling any desired form of body to be fitted. The firm are also showing one of their 24-28-h.p. engines (Fig. 33), designed for 2-ton lorries or marine work. Like the 12-14-h.p. type, this has separately cast cylinders, 4½ in. bore by 5 in. stroke, and a single-cam shaft. The object of the designers has been to produce a motor, which shall run for long periods without requiring repairs; to this end special attention has been devoted to the bearings, and to the lubrication. The latter is effected by a pump fixed to the lower half of the crank chamber, and driven by skew gear off the cam shaft, with a vertical shaft and spring drive. The oil is drawn from the bottom of the crank chamber, and distributed through a series of pipes to the cylinder walls, connecting rods, main bearings, and all other working parts of the engine, then returns to a reservoir, forming a complete circuit. The system is entirely automatic, positive in action, and very simple, the only fixing on the dashboard being a small gauge-glass to show that the pump is working. Two systems of high-tension ignition are provided, accumulators and magneto. The latter is mounted on a base plate formed on the crank case, and is so arranged that it can be readily detached at any time. Specimens of the firm's gear-boxes, differentials, and other component parts are also on view, and demonstrate the high class character of the work.

Oil Cans, etc.

Excellence of construction, no less than utility in design, has been a factor in the popularisation of the seamless copper, brass, and steel oil cans of Messrs. JOSEPH KAYE AND SONS, LTD., amongst motorists. The inside parts of the patent locomotive oil can are tinned, so as to prevent verdigris, and made in highly-finished copper it has become a familiar part of the equipment of garages, etc. The firm's petrol squirt can is another speciality. This is recommended for cleansing purposes. It will force petrol or any similar liquid a distance of six feet, and can also be employed for lubricating oil. For ordinary lubricating purposes, however, K.'s seamless serrated copper or brass valve oil cans are an admirable device. The body or can is formed of one piece of metal, and is fitted with a sieve which absolutely prevents the passage of grit or dirt to the working parts of the automobile. All these specialities are on view at the exhibition, as well as an improved oil economiser for lubricating oil. This has a pump, which provides for an easy and rapid flow of oil, which instantly stops when the action of the pump ceases. Clean in use, it also conduces to economy, and should be found in all motor depôts, as well as the motor houses of those who own cars.

Dry Cells.

The Siemens-Obach dry cells for ignition purposes are exhibited by Messrs. SIEMENS BROS. AND CO., LTD. These have a low internal resistance and consequent large output of current. The cells possess great powers of recuperation, and Messrs. Siemens recommend that for ignition with multi-cylinder engines two complete batteries should be carried, one connected to either side of a two-way change-over switch. By this means the two batteries can be used alternately, the combined useful lives of the two batteries being extended beyond the time that they would last if each were worked continuously. Several sizes of single cells are shown for making up into batteries for small cars, as well as batteries of three cells (4½ volts) made up in single boxes, with two special lock-nut terminals. These have about the same output as three of the corresponding single cells, but have the merits of compactness and convenience for handling. Larger batteries are also included in the comprehensive display.

The S. and G. Wind Shield.

A new wind, rain, and dust screen is exhibited by Messrs. GROVER AND SONS, of Abbey Street, Bermondsey, London, S.E. This is the work of a practical firm of motor body builders, is well made, and

Fig. 34.—The S. and G. Wind screen.

strongly and ingeniously jointed. It can be raised to any position, and can be easily arranged in wet weather to enable the driver of a car to maintain a clear view without having to abandon any part of the screen owing to raindrops falling upon the glass through which he is looking. The "S. and G." screen, which is illustrated in Fig. 34, is constructed to fit any car, and can be folded up and temporarily dispensed with when not required without having to be detached from the car. For comfort, as well as utility, the screen is to be commended.

Coventry Simplex Engines.

At the stand of Mr. J. E. GARRATT, reference to whose Lubrimer is reserved till next week, are two examples of the "Coventry Simplex" engines of four and six cylinders respectively. In the 16-h.p. four-cylinder engine provision is now made for thermo-syphon or pump circulation. An alteration has also been made which shortens the engine considerably. This consists of an enclosed gear drive for the

Fig. 35.—The Coventry Simplex Four-cylinder Engine.

magneto which is placed alongside the same shaft also driving the pump. The 4-cyl. engine on view does not contain this latest improvement, but it can be seen in the six-cylinder motor. These engines are of thoroughly sound construction and good principles of design.

Detachable Rims and Non-skids.

Mr. W. S. CORT, of Market Harborough, is again present with his well-known non-skid. He also associates with this invention the Beresford rim, which we favourably noticed in our issue of November 23rd last, and which has undoubted advantages. Its security has been well demonstrated, and its ease of attachment and detachment. The latest form of the Cort non-skid band is that known as No. 2. The band is made up of three layers of chrome leather. The first envelopes the tyre. The second is the foundation for the hardened studs to clench on, which makes them impossible to pull out or come in contact with the tyre. The third acts as the tread, and is fitted with three or four rows of hardened studs, thus obviating a side-slip or puncture. The tread may be removed where worn down and another fitted to the existing device; and this process may be repeated time after time. The fastener of the No. 2 band is new. The cover is held in position by twelve steel clips clipping into the rim on each side of wheel, through which screws pass which are fastened to the chromed leather. These screws being fitted with hexagon nuts, make it possible to adjust the band to fit any make of tyre perfectly tight, and when once adjusted need no attention for thousands of miles, as it is not at all necessary when attaching or detaching to undo these screws, as the clips may be slipped in or out of the rim same as No. 1. All metal parts of Cort's bands are "spheradized" by the patent process, so that rusting is rendered impossible.

Upholstery for Motor-cars.

At the stand of the THAMES BANK WHARF MOTOR WORKS, LTD., a good selection of upholstery made by machinery is displayed. The system of production is such as to secure the most reliable results, and the buttons on the upper surface of cushions, seats, &c., are secured right through the material, and held by fasteners at the reverse side of the cushion. The company have the sole concession in this country for this method of upholstery, and it should give them a great pre-eminence on that account. Motor-car screens and Cape cart hoods complete their display.

Clothing.

Messrs. CHARLES BAKER AND Co., LTD., have a good selection of clothing for motorists, including some specialties, in which are incorporated good design and sound construction, with a view to rendering the raiment thoroughly weatherproof. We notice, too, that regard has been paid to the pockets of motorists, and that reasonable prices prevail in all sections of their clothing department. A heavy tweed breasted overcoat is an excellent speciality, which can be used as an ordinary walking coat as well as when on the car. Liveries are an important

branch of the tailoring department of Messrs. C. Baker and Co., Ltd., whose business with motorists should materially increase as a result of their present enterprise.

Map for Motorists.

Mr. G. WHEATLEY, of Scotgate, Stamford, drove up from that town on his Argyll car, on which he is showing his combined switch and brake lever for independently controlling the car from the tonneau—an idea which should prove of interest in the motor academies throughout the country. He has also brought out an ingenious map for motorists, known as the "Opti-map." In this the whole map of England, or of any particular district, is printed and mounted on a cylinder 6 in. long and 1½ in. diameter. The map revolves within the cylinder, and by means of a powerful lens, which is moved along guides outside the cases, every main road is brought into view. The arrangement is one of the most compact we have seen.

New Vulcaniser.

The principle of vulcanising in connection with the repair of tyres having become almost universally accepted, motorists are naturally interested in the appliances by which it can be efficiently and promptly effected. Several such appliances are on view, that of the FORGROVE MACHINERY COMPANY, LTD., of Admiral Street, Dewsbury Road, Leeds, being conspicuous by reason of its reasonable price and excellent results. As will be seen from Fig. 36, the device has few parts, is of small size, and the metal work being of aluminium, it is extremely light. Through the top of the combustion chamber charcoal is inserted, and after being sprinkled with methylated spirit, is fired by a match applied to the fire-grate below. More charcoal is put in, and in about fifteen minutes the heat will be up to gauge mark. On the top of the apparatus are four wooden plugs, which can be removed to reduce the temperature should it get beyond the desired heat. The heat generated in the combustion chamber is transmitted to the external surfaces used for vulcanising through the surrounding air-chambers, and by a special arrangement of heat-conducting ribs, thus ensuring uniformity of tem-

Fig. 36.—The Forgrove Vulcaniser.

perature over the vulcanising surfaces. Should it be preferred, gas can be used instead of charcoal. The Forgrove vulcaniser should be found upon many cars as well as in hundreds of garages during the coming season.

Next week's report will include references to the "Clair" silencer shown by Messrs. J. C. Lyell and Co.; the Vulcan distance recorders; the machine tools and lathes of Messrs. Drummond Brothers, Ltd., and the Colchester Lathe Company; several new detachable rims, the Kempshall tyre, new speedometers; Messrs. Smith and Son's Perfect Speed indicator, the G. L. Carburettor, the Simplex shock absorber, previously described in our columns; the "Belmont" non-skid; the engines, etc., shown by Messrs. Hurst and Middleton, Ltd.; the Prested electrical specialities, and the hundred-and-one other accessories exhibited in the Gallery.

(To be continued.)

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

INTERNATIONAL TOURING CAR TRIAL, 1908.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There are indications that the leading motor-car manufacturers, both British and foreign, intend to enter for the Royal Automobile Club's International Touring Car Trial to be held in June. May I be permitted, on behalf of the Royal Automobile Club, to inform your readers of the principal features of interest in connection with this important event.

Whereas the International Tourist Trophy race, held in the Isle of Man last year and in former years, was confined to cars having engines of practically the same size, this trial is open to standard touring cars having engines of practically any size from 6-h.p. to 60-h.p. In this respect it differs not only from the competition above mentioned, but also from the principal Continental events. Again, whereas many Continental competitions, to which public attention is attracted, are settled by speed alone, this trial will be decided on the points that appeal to the purchaser of the ordinary touring vehicle. The weakness of many former trials has been that the public was given no information as to the condition of the cars at the end of the trial. The race at Brooklands, which is to take place after 2,000 miles of road travel and twenty miles of timed hill-climbs, will demonstrate beyond all question the wear-resisting qualities of the respective cars, as it is clear that a car that has suffered badly during the road test can have no chance on the Brooklands track against a car that is practically in the condition in which it started.

Generally, the effect of the trial must be to enable the public to decide which are the best cars in the various horse-power classes, and its importance cannot, therefore, be over estimated. The results must be of world-wide interest as affecting the user of the motor-car on the

The 60-h.p. Six-Cylinder Napier recently supplied to the Rt. Hon. A. J. Balfour.

Amongst the chief characteristics of the car are the detachable wire wheels, the neat folding arrangement of the hood, and of the canopy over the driver. The car can be converted from an open to a closed carriage, or vice versa, by one person in a few seconds. When the top is lowered the car forms a completely open vehicle. The car is painted in Mr. Balfour's own colours, the bright fittings are in nickel silver, and electric lights and an indicator to the driver are installed.

Continent, in India, in the Colonies, &c., as well as the home user. The system of marking has been so arranged that the first car past the post at Brooklands will be the winner in its class, and the trial results will thus be known immediately, instead of some days or weeks after the event, as has happened in the case of former trials where results depended upon the allotment of marks.—Yours truly,

J. W. ORDE.
(Secretary R.A.C.)

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have followed with interest from week to week the letters on the above subject. I am not surprised at the unreciprocated interest of the manufacturers to one of your correspondents' letters, as they would only be giving away the results of experiments which have cost them much time and money. But, if we have not their arguments in favour of their timing, we, at least, have the results of their arguments i.e., their timing, then, by comparison of the best makers, we may synthetically build up the arguments by which they arrived at their conclusions, and possibly get a basis for further experiments. Of course I am assuming the investigator to have had some training in physics.

Mathematical accuracy is absolutely essential, as the time of overlap of inlet and exhaust valves on some of the best makes is only $\frac{1}{100}$ of a

second; with the engine running at 240 r.p.m. this represents a movement of 2 mm. at the top of the stroke.

None of your correspondents go into detail; one mentions the figures of setting of one engine, but omits to give figures of the alteration—this is useless for comparison. Possibly the results of an engine I tested may be of interest. The motor was a 4-cylinder 90 mm. bore by 110 mm. stroke, large inlet and exhaust passages, giving free ingress and egress, inlet opened 4.5 mm. down, closed 4.5 mm. up; exhaust opened 93 mm. down, closed 6.5 mm. down. This engine ran perfectly on the road, pulling well, fast or slow, but received no electric test, which personally I do not believe in, as an engine rarely runs under steady conditions, but under varying barometric pressures and high and low speeds.

As regards the Larrad Timer, the makers seem to have confidence in this, and it looks as though they are justified, as no one has accepted their challenge, although many have said they can get as good results by other means. Anyone acquainted with the difficulties of timing an engine correctly should welcome an instrument for facilitating the process.—Yours truly,

AJAX.

THE EFFECT OF STUDDED TYRES ON ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am surprised Capt. Windham should make such a dead set against such a useful and reliable invention as the studded tyre. Perhaps it is because it leaves an impression in the dust or mud, the same as the hob nails or tips on a working man's heavy boot would do. If the matter is reasoned out no doubt more road material would be loosened by a plain tread, caused by the suction. This is easily proved by a round piece of wet leather or rubber on a string, the same as a boy's plaything called a sucker, which will lift a stone of some pounds weight when pressed upon it. Now if the sucker had studs underneath it would be impossible to get a lift, on account of the air spaces between the studs, and I submit what applies to the sucker ought to apply to the tyre.—Yours truly,

STUDIOUS.

STEAM CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is very evident from his letter that your correspondent, S. Aspinall, has not had a very extensive experience of the petrol car. Possibly I have exaggerated or overdrawn my picture of the petrol car in my last letter, but by no means will I withdraw one iota of what I have said of such a car. Of course, I realise that all the "bloomers" mentioned might not occur at once.

I should imagine that the predominating feature of his car is that the hand brake withdraws the clutch. Permit me to point out here that if this was so, with such a car as I had in my mind, as soon as the engine was started, and in all probability raced like fury, before the driver could get round at the levers the brake would slip over the teeth of the quadrant, permitting the clutch to engage, and off would go the car, and the driver need not be the ignoramus your correspondent alludes to. For I know, and many others do, of similar instances to this: a splendid driver mechanic, who had just got out of a new Leon Bollée car, costing over £1,000 to buy, and finally drive away a car for his employer's son. Now here was a really good man, yet he did exactly what I have just described. Besides, you must know that the noise of an old car and the surrounding conditions of traffic is quite enough to agitate even an experienced man into creating such a fiasco as I have described, to the annoyance of your correspondent, in my previous letter.

To go on with the latter portion of his letter, I can assure him that no herculean efforts are required to turn the starting handle even when "in gear" and the brake on. Your correspondent here betrays his knowledge, because I have actually done the thing myself, not knowing that someone in my works had interfered with the speed lever. My partners and others would testify to this, and I can assure you that, had someone been in the car and advanced the ignition at the right moment, she would have gone right out.

Now what I have said now and in support of my previous letter is not intended to prejudice the uninitiated against the petrol car—that would want some doing—but it is simply meant to point out some advantages of the steamer.—Yours truly,

H. J. CHAPMAN.

ELECTRICALLY LIGHTED MOTOR LAMPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent can use the ordinary paraffin lamps by fixing adaptors and using 4 volt 3 c.p. Osram bulbs; these bulbs consume 75 amps. The best plan would be to use the single pole adapter with bulb to suit. Take the wire from the negative terminal of the accumulator and earth it to frame of the car, the positive wire to one terminal of switch (there will be one wire from each lamp), join the ends of these together and fix to the other terminal of switch. The 30 a.h. accumu-

lator will do all right, it will give you about twenty hours' light, so that if your correspondent charges his own accumulators or is near a charging station he has nothing to fear. The "single pole" is by far the easiest for wiring, as it saves wire and current and I fancy gives a better light.

The double pole is wired up on the same principle, but instead of the negative wire going to frame it goes to the second pole of the three lamps.

If large headlights are used, there should be a separate switch for the tail lamp and cut out side lamps.—Yours truly,

GEORGE D. DAVIDSON.

A TROUBLESOME ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*

SIR,—I have a 14-16-h.p. car. In four cases out of five my engine stops when trying to start. I am most careful to let in my clutch gradually, but the car still starts with a jerk. I have put some oil on the leather of the cone; the result, however, is not appreciable. Does racing the engine at the start in any way cause this trouble? The car, I might mention, is less than twelve months old. The transmission is by cardan shaft. I should be very grateful for your opinion.—Yours truly,

C. FIRTH.

[It would appear that there may be a defect in the clutch, and that dressing the leather with oil has not got at the root of the evil. Correspondents would assist greatly if they would give fuller details in their queries. Mr. Firth does not tell us if his engine is a two or four cylinder; we presume it is the latter. Also he does not say whether the trouble is one that has recently crept up, or whether his clutch has

fine spray. I have tried without any outlet, then it is driven out through the bearings. The engine works well so long as there is oil in chamber, but the reverse when it is all gone.—Yours truly,

C. W. C.

[It is very difficult to keep the oil properly in a motor in which the two pistons of a two-cylinder engine move up and down together, on account of the large volume of air they displace. "C. W. C." has tried a good many remedies, and among them one which we think, if properly carried out, should effect, if not a cure, at least a marked improvement. We refer to an outlet valve—that is to say, of course, one which can only open outwards. It is no good, however, fitting a small one; this would be useless. Its capacity should be at least that of the combined area of two of the valves of the motor, and it should project vertically, or nearly so, from the crank chamber at the end of a tube about nine inches high. The tube carrying the valve can be fixed to the side of the crank case, by means of a flanged elbow. The bore of the tube and the hole in the side of the crank case must, of course, be in proportion to the area of the outlet valve at the top of it. The valve itself may be of the flap type, shod with leather; or a light mushroom valve working on a fibre seating may be employed. The object, of course, is to keep the crank case below atmospheric pressure. Fitting stuffing glands on the bearings is another remedy that we have seen applied to some engines given to exuding oil, and this is also more or less successful, but considerably more trouble and expense to fit than the method we describe above.]

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note your correspondent's letter signed "Drip." I myself have experienced the same difficulty, which I believe is frequently due

Lautenschlager on the Mercedes Car he will drive in the A.C.F. Grand Prix Race.

been a nuisance right along. Putting oil on a clutch does not make it slip once it has soaked in; in fact, it will often make a clutch hold that slipped before its application. Our correspondent might try roughing the leather with a rasp, and then dressing with French chalk. Cork insets are a great improvement to clutches and make the "take up" very sweet. If the clutch is badly designed—wrong angle for instance, or if the pedal movement is not well proportioned, or the clutch spring unnecessarily strong, then he must seek the aid of a motor engineer. Racing the engine at the start will certainly cause the trouble; it should only be run at sufficient speed to take up the load without pulling up. Also if the ignition and throttle are not set at the best point there is always a probability of not being able to start away nicely.]

LUBRICATION DIFFICULTIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could you or any reader of the *M.C.J.* kindly help me over a difficulty by either a sketch or instructions for a device to retain the oil in the crank chamber of a two-cylinder 10-12-h.p. Bachet engine? Both pistons are connected to one crank pin, cylinders side by side, both pistons moving up and down together, therefore getting an impulse every revolution. I have tried all means that I could think of to keep the oil from being driven out, by means of tubes of various sizes, some filled with fine wire gauze, valves, outlet and inlet, thinking that the suction stroke in the chamber—that is, the up stroke—would draw back any oil driven out by down stroke. The last thing I tried is fixing an enlarged cylinder on the top of a 1 3/8-in. tube, but all to no effect. There is a powerful blast from the tube when engine is running and the oil is blown out in a

to the effect of temperature changes upon the consistency of the oil, as it more usually occurs in cold weather. I have experimented with a quantity of different oils and am now using "Ilo" light lubricating oil supplied by Easton and Melville, Ltd. This I find gives excellent results and has not shown any tendency to clog in the lubricator, and I believe that if "Drip" were to try this oil his trouble would be overcome.—Yours truly,

40-H.P.

THE TAXATION OF MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am opposed to any tax which tends to check the free communication between the various parts of the kingdom. Free and unfettered communication is essential to commercial prosperity, and in my opinion any such tax is more than lost in the check it gives to trade. If the tax be much heavier for the moderate motorist than it is at present, I shall certainly give up my car. At the same time I would willingly pay a tax for the improvement of roads of the country, to be managed by the State, as is at present done in France.—Yours truly,

A. A. PADLEY.

DE DION writes:—"I should like to know if any owners of 6-h.p. cars provided with two speeds only have had successfully fitted a reverse."

THE CARBURETTOR AND ITS FUNCTIONS.*

(Concluded from page 82.)

PRESENT-DAY FAULTS OF THE MIXING VALVE SUMMED UP.

We may get a better understanding of the features necessary in a perfect mixer by considering a typical present-day carburettor. This consists of a float chamber, usually at one side of the air passage and with a long, small nozzle for petrol reaching into the air passage, which at this point is strangled or contracted to increase the velocity of the air past the nozzle. Between the nozzle and the engine an auxiliary opening is provided, closed by a spring valve, which, when the suction is increased sufficiently, opens more or less, admitting a quantity of pure air with which to dilute the over-rich mixture coming from the strangled passage. The action of this device is about as follows: At extremely slow engine speeds, say under 200, the mixture is imperfect because the air passage is not small enough to give proper air velocity for a suitable spray. This is one of the reasons why the gas engine is regarded as inflexible, and why many engines fail to develop power as soon as their speeds are reduced. If this passage is small enough for perfect running at very slow engine speeds, say 50 to 100 r.p.m. with throttle practically closed, it is too small to admit a practical amount of air at higher speeds, so the petrol by itself, or badly mixed with air, is drawn from this passage, while the greater portion of air, with imperfect provision for mixing, enters at the auxiliary valve. Clearly this cannot give a proper mixture or proper proportion. Next, it must be remembered that, while the strangled passage is constantly open, the auxiliary passage is closed except when sucked open. Further, the auxiliary valve flutters, and the result may often be that in the early part of a stroke the mixture is exceedingly rich, because it all comes from the strangled passage, while later, the auxiliary having been sucked open, a large quantity

The 15-h.p. Mors lately supplied by Mors (England) Ltd., to Mr. C. R. Burkill, who is taking the car to Shanghai.

The vehicle is fitted with a very racy, long, two-seated body, a small extra folding seat being provided at the back.

of air enters (larger than necessary), with resultant poor mixture, followed by closing of the valve as the suction decreases near the end of the stroke, with consequent rich mixture at this time. Add to this the fact that with a long, slim nozzle the petrol will continue to flow for some time after the suction stops, because of its momentum, and it will be seen that the beginning and end of each charge are probably overfat, while the centre of the charge is very lean.

WIDE RANGE OF SUCTION.

There is also a wide range of suction, because at the beginning and end of the stroke there is little or no vacuum and the strangled tube offers a free passage, while at the centre of the stroke there must be, and is, enough vacuum to open the auxiliary; so it is quite evident that the engine is not drawing uniformly and is not free from that negative pressure or vacuum necessary to get the largest charges and to avoid needless loss of power. The ideal carburettor will avoid this irregularity by opening a passage proportionate to the amount of mixture required, and it will not only open the air passage, but it will adjust the petrol to suit. If, for example, a piston or diaphragm is provided, operated by the suction of the engine in one direction and by gravity in the other, with a dash pot so that it cannot flutter, it may be made to open the air passage and to adjust the petrol so that with little or no increase of suction the proper amount of air and liquid is admitted. With such arrangement the vacuum need only be sufficient to give the air the necessary velocity required to make a proper spray, and higher speeds will not starve the engine

*Abstract of Paper read by Mr. C. E. Duryea before the American Society of Motor Engineers, Buffalo, N.Y.

because of higher vacuum. The dash pot ensures average openings, so that at the beginning and end of the stroke the velocity will be low, at the middle high, but with an average somewhere higher than the least practical velocity, while good results will be obtained even during the slow portions of the stroke.

THE IDEAL CARBURETTOR.

Many typical carburetors have quite abrupt corners. This decreases the amount of air that can enter, and thus impairs the efficiency. Some provide for complete vaporisation within the carburettor, or very close thereto, with the result that in wet weather the moisture of the atmosphere is condensed, and in cold weather frozen, thus choking the device with ice. It is better practice to carry the spray some distance and thus distribute this refrigerating effect, with less likelihood of ice formation.

In conclusion, the requirements of the perfect mixer may be summed up as follows: It must intimately mix, properly proportion and satisfactorily adjust, and also have the following specifications: Float chamber concentric with inlet and nearly concentric with outlet; float of metal with point adjustable to different heads, different liquids and different weights of float; float point easily ground, and moved by any motion of the float; the float should be free from balance-weights or levers; the mixer should be adjustable by the operator while driving; it should have adjustments for very low speeds and also for normal or high speeds, and should automatically adjust between these speeds; it should have a short petrol passage for quick action, and a large petrol passage to prevent clogging or ramming; it should retain in the air passage unsprayed liquid, but have provision to let out any excess. A gauze strainer at the petrol inlet and also at the air inlet are strongly advised. The petrol should flow in a single direction, either up or down, to the float chamber from the tank. The float chamber must have vent at the top, which should, if possible, open higher than the tank; it should have removable bottom and a means to shut off the petrol. The air passage should be easy and single, rather than multiple, and have a removable gauze to prevent unsprayed liquid reaching the engine. This passage should be adjustable to the engine speed by the amount of suction, and should open freely in a reverse direction to permit back explosion to escape. A dash pot must prevent fluttering with change of opening, so that the suction vacuum is closely constant. Provision for heating is necessary in cold weather or with low gravity liquids. A mixing device which meets these requirements leaves little room for improvement.

ROAD REPORTS.

"POLICE CONTROLS."—The Portsmouth road at Putney has again its measured distance over which the police are timing motorists. The trap at Bromley Common is now in almost daily operation. Police traps have re-appeared in the Maidstone district.

BRIGHTON ROAD.—Timing is taking place every week end at Reigate and Redhill, and the police are frequently engaged in timing cars between the 20th and 21st milestones.

SOUTHAMPTON.—The Southampton Borough Council has asked Mr. Sidney Tebbutt, M.I.Mech.E., of Freemantle Chambers, Southampton, to obtain information as to methods of treating roads for the allaying of dust. He will be pleased to hear from gentlemen having any special knowledge on the subject.

IRISH RELIABILITY TRIAL.

It has been decided to offer gold medals to the successful team of private owners entering in Section II., in addition to the team prizes already announced in Section I. Gold medals will be given on condition that at least three teams enter, and silver medals if two teams enter. These awards will be made to the team which obtains the highest total marks for reliability. In the event of a dead heat for reliability, the hill and speed test marks obtained by the cars in their respective price classes will be taken when making the award. No formula will be used when making out the hill climb and speed test marks in each class, the marks being given in proportion to the actual time taken in each hill climb and speed test.

ONE of the newest aids to motorists for dismounting and remounting covers is the "Talbot" lever shown by Maison-Talbot at Cordingley's Show.

It was reported that Mr. Charles Jarrott had tyre troubles when attempting to lower the world's records on the 13th Inst., and an impression has got abroad that Palmer cord tyres were used, but this was not the case. Another make of canvas-lined tyre which had not been tried previously was used.

MR. W. F. HINTON has joined Mr. F. Webster, Wells Street, Oxford Street, London, W., in the latter's business in second-hand motor-cars. Each partner will devote himself to the commercial and technical side of the business respectively.

As a guarantee of the faith which Vauxhall Motors, Limited, have in their products, they are offering to maintain and keep running their 12-16-h.p. Vauxhall, and take all risks regarding same, and also supply another car if the machine should be laid up for repairs, at an inclusive price per annum.

CLUBS AND ASSOCIATIONS.

MOTOR UNION.

A GENERAL conference of automobilists was held at the Hotel Cecil, London, on Wednesday (prior to the annual general meeting of the Motor Union), to consider the political situation so far as it affects motorists. The resolutions submitted were as follows:—(1) That this representative conference of automobilists is of opinion that additional taxation of motor-cars for the general purposes of revenue would tend to retard the development of improved methods of transit, and should be strongly opposed as contrary to the public interest. (2) That this conference strongly supports the recommendation of the Royal Commission on Local Taxation that financial assistance should be given by the State to local authorities for the purpose of improving the roads, and is of the view that taxation derived from motor and other vehicles should be administered by a central department as a grant-in-aid for highway purposes. (3) That in view of the difficulty of arriving at an equitable basis of taxation for motor vehicles this conference is of opinion that before any change is made in the existing basis there should be a public inquiry by a Departmental Committee.

At the annual general meeting which followed the Motor Union medals won during 1907 were distributed.

AUTOMOBILE ASSOCIATION.

AGAIN has the Automobile Association scored a great success at its annual dinner. This was held on Wednesday of last week, at the Hotel Cecil, London, when Col. W. J. Bosworth was supported by a large company of distinguished motorists, including Lord Montagu, Sir Henry Kimber, M.P., Messrs. L. Schlentheim, Charles Jarrott, Walter Gibbons, S. F. Edge, A. Harris, Herbert Smith, Amery Parkes, Charles Temperley, Captain Bennett-Stanford, J.P., Charles Cordingley, J. W. Orde, Ballin Hinde, Staplee Firth, Rees Jeffreys, and others.

The toast of "The Automobile Association" was proposed by Lord Montagu, in the absence of Mr. C. D. Rose, M.P., owing to the illness of his son. Responding to the toast, Col. Bosworth read letters of regret from the Earl of Onslow, Earl Poulet, Sir Charles B. Locock, Bt., the Earl of Plymouth, and the Earl of Orford, all of which contained expressions of appreciation of the work done by the A.A. Colonel Bosworth said when he first addressed them the A.A. numbered 300, in the following year they numbered 3,000. Now that 3,000 was doubled. The sphere of their operations had also been extended in the same satisfactory manner. Only £292 was spent on patrols during their first year, in the following year £1,964 was spent, and from May last down to date nearly £6,000 had been expended on patrols alone. 1,200 miles of main road were covered, and they had 1,500 road agents, 300 danger warnings had been erected at the expense of the Association, also nearly 1,000 village signs, and during the coming year it was hoped to largely extend this work. For the benefit of A.A. members wishing to tour on the Continent, triptyques were now issued, by virtue of which it was only necessary to make the necessary deposit at the A.A. offices before entering France, Germany, Holland, Belgium, Italy, or Switzerland, when all the usual inconvenience in passing through the custom houses on the frontier would be avoided. Their relations with the police became pleasanter as the A.A. grew older. The police now recognised the wish of the A.A. to help them in every reasonable way in restraining inconsiderate driving, and realised that the greatest assistance could be afforded them by the A.A. As an example: A man was recently knocked down by a motor-car and killed. The police communicated with the A.A., alleging that the driver had driven on without stopping to see what injury he had caused. Within a few hours that driver was being looked out for on 1,200 miles of road. Unostentatiously, the Association was undertaking an extraordinary amount of correspondence work in communicating with owners of cars observed to be driven inconsiderately. County councils had invited and obtained assistance in restraining inconsiderate driving at certain dangerous points in their counties. Such assistance was given willingly, for the A.A. had nothing to do with the hooligan driver and would not raise a finger to shield him from his just punishment.

Mr. S. F. Edge proposed "The Press," on whose behalf Mr. T. McDonald Rendle responded, and the toast of "The Visitors" was given by Mr. C. Jarrott.

Then followed—thanks to Mr. Walter Gibbons—an entertainment of an entirely unique character, which was thoroughly enjoyed by all.

AUTO-CYCLE UNION.

MR. ROBERT TODD presided over a large attendance at the annual meeting of the A.C.U. at the Imperial Restaurant, London, on Saturday. The chairman read the new agreement entered into by the A.C.U., showed that they had complete control over their own affairs, and set forth the advantages of associateship of the R.A.C. The treasurer, Mr. C. A. Smith, presented the balance-sheet, which showed the Union to be in a very good position. They had now £500 in hand.

It was decided to approach the Scottish Cyclists' Union with the view to inducing them to relinquish the control of motor-cycling sport in that country, so that the clubs and motor-cyclists there could effect their desire, and join the A.C.U. A similar course was adopted with respect to Ireland. It was decided to hold the council meetings four times each year, alternately in London and the provinces.

BASINGSTOKE.

MR. T. BAKER read an interesting paper on "Some Early Experiences with Heavy Road Vehicles," before the Basingstoke and District Motor Club, on the 11th inst. Mr. N. Endacott was in the chair, and mentioned that he shared many of Mr. Baker's early experiences.

Mr. Baker then described how he drove the very first steam wagon manufactured by Messrs. John I. Thornycroft in the red flag days. He also described an amusing incident in the Liverpool trials, when he was driving a heavy seven-ton steam wagon, the only fault of which was the difficulty in restarting on a hill, owing to lack of adhesion, and how, when negotiating a very stiff hill, a 6-h.p. Daimler van in front of him missed gear and came careering backwards down the hill. Knowing the extreme difficulty he would experience in restarting if he once stopped, and also the impossibility of steering clear of the runaway vehicle, Mr. Baker kept his wagon going, caught the van in the rear and carried it triumphantly to the top, much to the surprise and satisfaction of its driver.

Many other incidents contributed to a most interesting change from the usual more or less technical papers read before the club, and at the finish the speaker came in for a very hearty vote of thanks. Mr. Baker briefly replied and the meeting terminated.

SHEFFIELD AND HALLAMSHIRE MOTOR CYCLE CLUB.

A LETTER concerning the taxation of motor-cars has been sent on behalf of the members of the Sheffield and Hallamshire Motor Cycle Club to all the local members of Parliament, in which they speak as representing motor-cyclists of Sheffield and district to the number of about 400.

The Siddeley 10-h.p. Motor Cab.

"Motor-cyclists," says the letter, "have from the first been very unfairly treated. This was partly their own fault, because they had little or no organisation to represent them, and their case was looked after by the Motor Car Organisations, but so badly was their case put before the authorities that they were actually taxed higher in proportion than their more wealthy friends the car owners. In proof of this we will say that taking the average value of motor-cars weighing under one ton as being £350, and the average motor-cycle as £15, which is a very fair average, we find that the car owner pays 2½d. in the £ taxation on his car, but the motor-cyclist pays 1s. 8d. in the £, or to take it on percentage, we see that the car owner is taxed about 1 per cent. on value, but the motor-cyclist is taxed 9 per cent. This hardship is all the greater when it is seen that the motor-cyclists of to-day are not wealthy persons. Many machines are sold for £10 and under, and working men can afford to purchase them at this price, and make use of them as a means of getting to and from their work. They are also largely used by small traders for delivering goods, &c."

NOTTINGHAM.

ON Friday of last week the Nottinghamshire A.C. held an enjoyable entertainment at the Victoria Station Hotel, Nottingham. At the invitation of Mr. Charles Hardy, the president, an admirable series of bioscope views of motoring subjects was presented, and at the conclusion Mr. J. W. Orde proposed a vote of thanks to Mr. Hardy, which was seconded by Mr. Atkey. In the course of his reply Mr. Hardy made announcements with regard to the summer programme of the club, and referred with pleasure to the provincial meet of the R.A.C. to be held at Nottingham on May 9th. The Duke of Portland had accorded consent

for a drive to Welbeck, and, in addition, had permitted the club to use the Clipstone track for the trials on May 2nd.

JUNIOR.

THE opening run of the Junior A.C. takes place on Saturday, the 4th prox. The destination selected is Bognor, where hotel accommodation, with supper, bed, breakfast, and lunch the following day, has been arranged for members and their friends at a special rate.

The Engine of the Weigel Six-Cylinder Car.

The cylinders have a bore of 130 mm. and a stroke of 140 mm., while the ignition is by low-tension magneto. The first car of this type was recently delivered to the Earl of Wilton.

The return to town will be on Sunday afternoon, with a halt at Horsham for tea.

HERTFORDSHIRE COUNTY.

THE Hertfordshire County A.C. has issued a delightful souvenir of the successful season enjoyed in 1907. This is illustrated with photographs of the various social and motoring events organised by the club. The results of the hill climb, &c., are also given, and the publication is an innovation in club literature upon which the hon. press secretary, Mr. A. J. Salmon, is to be congratulated.

The Standard 5-ton Colonial Steam Wagon. (See last issue).

BROOKLANDS.

SUPPLEMENTING the programme of the Easter meet of the B.A.R.C. published in our last issue the following further races will be run:—The Sizaire et Naudin Cup over a three-mile course; the Spring Stakes of 5 sovs. each; the April Stakes of 50 sovs.; the Paddock Stakes of 5 sovs. each; the Tyre Change Plate of 30 sovs. and the first Brooklands motor-cycle race of 25 sovs.

MATERIALS OF MOTOR-CAR CONSTRUCTION.

IN the course of his paper before the Sheffield Society of Engineers and Metallurgists on Monday, Mr. A. W. Reeves, of the Sheffield Simplex Motor Works, dealt with the need for uniform powers of resistance relative to stresses imposed, and its bearing upon efficiency and economy of operation. It was the object of the designer to so distribute the material composing the detail parts that throughout the machine the ratio of maximum stress to the point at which rupture occurs was constant. In other words, the "factor of safety" should be constant for every part of the car. That expression, as a rule, referred to the ratio existing between the maximum load to the ultimate strength. Other factors, however, entered into the subject, which made that ratio absurd. The foregoing, he added, was necessarily an ideal only, which to approach as commercially possible was the aim of the designer, for, if it were possible, they would have a machine the useful life of every part of which would fail at approximately the same moment, hence when the machine came to the scrap heap it did so with every part at its minimum value. The stresses imposed on the mechanism of a motor-car were in many cases incalculable. In such parts as gear wheels, for instance, the stresses on teeth must often approach a maximum of 60,000 lbs. per square inch. He instanced a car striking a rut in the road—one wheel striking the rut sooner than the other, due to its diagonal direction—when travelling at, say, thirty-five miles per hour, and said that the impact on the steering gear was tremendous. The blow might not reach the point of rupture of the material, but they must remember that that sort of thing was taking place scores of times during the day's run, and it was the repeated stresses which told. So long as a car was running swiftly and smoothly the stresses acting upon the shafts, gear, &c., were very nearly constant, and energy was being furnished by the motor at practically a uniform rate. When, however, the engine was hardly pressed to meet the demands for the requisite energy under a given condition, the stresses acting upon all parts of the car's mechanism were

Mr. Tom Browne's Impression of the A.A.'s Latest Development in the way of Continental Touring Facilities.

justly in an extreme degree, and the loads thrown upon the parts varied widely from severe driving stresses during the height of the explosion stroke, to slight driving efforts, or even, perhaps, negative efforts, at the end of compression stroke. Of course they knew the multi-cylindere engine did much to alleviate that, but it was a factor to be considered all the same. A part which demanded their closest attention, he said, as regarded the stresses in play and the physical properties of the material to be employed was the crank shaft. It was questionable whether medium grade carbon steel did not give as good results as chrome nickel steel. In any case, the factory costs were reduced by using the medium grade. As to the making of cylinders, the point was whether the reverberatory furnace did not give better results than the old cupola method of casting. Too much care could not be taken in the quality of metal used if success was to be obtained in the making of cylinders. With regard to gears, what they wanted was a steel which need not be case hardened, whilst retaining its properties to resist wear, thus getting away from the deformation due to treatment. He laid stress on the strength of some of the special aluminium alloys, which were very much in excess of those thought obtainable, an alloy having a tensile strength of 30,000 lbs., with an elastic limit of 16,000 lbs., 2 per cent. elongation, being easily obtainable. With regard to steel castings, it was thought that much more might be done in this connection for motor-car manufacturers.

ONE of the features of this year's season at Biarritz is the great number of Daimler cars in the town. There were eight at the same time at the golf links the other day, and at the races last week, out of forty-two cars in the motor enclosure, six were Daimlers.

THE MOTOR ACCESSORIES COMPANY, of 55, Great Marlborough Street, London, W., have been appointed sole concessionaires for the British Isles of the well-known exhaust whistle, which they have been selling for some time past under the title of the M.A.C., and which will also in future be known by that name.

CASES UNDER THE MOTOR CAR ACT

THE VALUE OF A SPEEDOMETER.

WALTER MIDWINTER, a chauffeur in the employ of the Daimler Company, has been summoned at Woolwich for having driven a motor-car at an excessive speed at Charlton Road, Westcombe Park. Defendant said that the speedometer did not register a higher speed than twenty miles, and this was corroborated by Mr. Colin Wilkinson, an engineer in the employ of the company, who was in the car. This witness stated that he knew there was a police-trap in Charlton Road; that was if he could believe the word of a policeman, for a policeman told him of it. Mr. Knight (prosecuting for the Commissioner) asked the witness for the name and number of the officer. After a protest, the witness said he could not give the name and number, but he believed he could identify the constable. On the day of the alleged offence he had been to Woolwich Police-court, and before leaving asked a constable near the door if he could avoid the tram-lines on the lower road. The constable advised him to go over Blackheath, and witness observed to the chauffeur that there was probably a "trap." With a laugh, the constable said, "As a matter of fact, there is—in Charlton Road." The summons was dismissed.

ALLEGED NEGLIGENT DRIVING.

Oswald Belt, of Hartham Road, Isleworth, was summoned at Brentford for negligently driving a motor-car at the Powder Mill Bridge, Staines Road, near Bedfont, on January 28th last. Mr. Staplee Firth

INTERNATIONAL TOURING CAR TRIAL.

THE Anglo-American Motor-Car Company, Ltd., have entered a 10-h.p. Cadillac car in class 2B; Messrs. Brown Bros., Ltd., have entered a 25-30-h.p. Brown car in Class 5; the Daimler Motor Co. (1904) Ltd., two 35-h.p. Daimlers in Class 7; the Hillman-Coatsen Motor Car Co., Ltd., a 54-h.p. Hillman-Coatsen car in Class 7, and one of 12-15 h.p. in Class 4.

AUTOMOBILE ACCIDENTS.

A MOTOR CAB, in which Lord Marcus Beresford was riding, was entering the centre of Enfield recently, when it was suddenly confronted by a van at right angles. To avoid a smash the driver turned sharply, and the car skidded, with the result that one of the off wheels fell to pieces, while the vehicle was only prevented from falling across the pavement by coming in contact with a tree.

A SERIOUS motor-car accident occurred at Andover the other morning. A horse and trap, driven by a man named Hounslow, coachman to Messrs. Tasker, of Waterloo Iron Works, was passing over the cross roads, and before getting clear a motor-car driven by Mr. Moore, jun., of Andover, collided with the trap, with the result that Hounslow was thrown out, and sustained injuries to the head. He was removed to hospital.

Motoring in Mexico.—A Halt at San Mateo (Xalpa).

[El Automovil en Mexico.]

defended and the prosecution was conducted by the police. The defence was a denial that the man was injured by the motor. A friend of the defendant, who was in the car, said that defendant took the only possible course under the circumstances, and had the driver of the wagon who was injured had control of his horses the accident would not have occurred; the man was not struck by the motor, he was thrown against it by the wagon. Mr. Sharpe said the defendant had committed an act of negligence. As the case was not serious, however, they would only impose a fine of 1s., but the defendant must pay £5 as compensation to the injured man Whitmore, and it would be understood that the latter should take no further proceedings. A further £1 was ordered to be paid to the witnesses.

LEAVING MOTOR-CAR UNATTENDED.

For obstructing the free passage of the highway at Christchurch Street East, Frome, by leaving a motor-car thereon for 45 min. (from 12 noon), Archibald Hobbs has been fined 10s. and costs at the Frome Petty Sessions.

EXCEEDING LEGAL LIMIT.

At the South-West London Court, on Monday, Viscount Curzon personally attended to a summons, before Mr. de Grey, charging him with driving his motor-car at an excessive rate of speed. P.C. Walton and another officer timed his lordship over a measured distance on the Portsmouth road, Putney, on the 7th inst., and his rate of speed was 29 miles an hour. Viscount Curzon denied that he exceeded the limit, and justified his conclusion by the fact that he was able to pull up in the car's length. The magistrate imposed a penalty of 30s., with costs.

THE UNITED MOTOR INDUSTRIES, LTD., have heard from a Salisbury motorist who has had Castle accumulators in use for four years without having any trouble.

THE London branch of the graduates' section of the I.A.E. has arranged a full programme as far ahead as May, 1909. This includes visits to various motor-car works, a tour of motor factories in the Midlands, to start on July 10th, and various papers for the winter session, which will open in October next.

THE Sheffield-Simplex agency for Northumberland, Durham and Cumberland has been recently taken up by the well-known firm of Sir Wm. Angus, Sanderson and Co., of 65, Westgate Road, Newcastle-on-Tyne.

MR. H. C. WILLSON, who has been works manager and buyer for the past seven years to the Wolseley Tool and Motor Car Company, Ltd., has now taken on the representation of several Birmingham and Coventry houses in motor components and machine tools, &c.

TEXALEINE is being exhibited at the Cordingley Show by the Texaleine Company, Ltd., 33, Chancery Lane, E.C. This is admirably adapted for cleansing the paint and metal work of automobiles.

THE repair works which Messrs. Stuart Morrison and Co. have established in London are able to cope with every demand that may be made upon them, although they are at the present moment fully engaged retreading "Durandal" bands. This band was first manufactured as far back as 1899. It has altered very little since it was first manufactured. A new price list has just been issued from 199, Piccadilly, London, W., from which we notice that prices have been reduced.

FORTHCOMING EVENTS.

MARCH.

- 27th (F.) and 28th (S.).—Closing hour 9 p.m.
CORDINGLEY'S THIRTEENTH INTERNATIONAL MOTOR-CAR EXHIBITION
 at the Royal Agricultural Hall, London.
 29th (Sun.).—Opening Run of the Southend Motor Club to the White Hart Hotel, Witham.
 31st (Tu.).—Last day for receiving entries, at ordinary fees, for the International Touring Car Race.
 Entries at ordinary fees for the Scottish Reliability Trials close at noon.

APRIL.

- 4th (Sat.).—Auto Cycle Union dinner to road-menders on the Ripley road at the Anchor Hotel, Ripley.
 11th (Sat.).—Annual open Flexibility Contest of the Crystal Palace A.C.
 Opening meeting of the Nottinghamshire A.C. at Edwinstowe.
 16th—20th.—Easter Tour of the Motor Cycling Club.
 17th (Good Friday).—Linca. M.C.C. meet at Mablethorpe.
 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.
 25th (Sat.).—Open Motor-Cycle Hill Climb of the Hertfordshire C.A.C.
 Opening meet of the Yorkshire A.C. at the Hotel Majestic, Harrogate.
 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F.
 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Epping.

MAY.

- 1st (F.).—The Frome's Hill Climb of the Herefordshire A.C.—provisional.
 2nd (Sat.).—Impromptu pace judging competition of the Sheffield A.C. at Ollerton.
 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
 10th (Sun.).—Targa Florio Race.
 16th (Sat.).—Fifty miles Consumption Trial of the Hertfordshire C.A.C.
 21st (Th.).—Reliability Trial of the Irish A.C.
 23rd (Sat.).—Clipstone race meeting of the Notts A.C.
 Meeting of the Yorkshire A.C. at Helmsley.
 25th (M.).—Industrial Vehicle Competition of the A.C. de France.
 28th (Th.).—Visit of the Aero Club to Aldershot.
 30th (Sat.).—Meet of the Herts C.A.C. at Hatfield Park.
 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
 5th—6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
 Start of the International Touring Car Trial of the R.A.C.
 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
 13th (Sat.).—Hill climb of the Notts A.C. at Oakamoor.
 16th—19th.—Scottish Reliability Trial.
 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
 27th (Sat.).—Hill climb of the Midland A.C. at Shelsley Walsh.
 Saltburn beach races.
 28th (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
 6th (M.).—Grand Prix A.C.F. (Voiturette section).
 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
 18th (Sat.).—Annual Gymkhana of the Herts C.A.C. at The Grove, Watford, by permission of the president, the Earl of Clarendon.
 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club.
 Annual Open Hill Climb of the Midland A.C.
 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

AUGUST.

- 29th (Sat.).—Meet of the Lincolnshire Motor Club at Lincoln.
 30th (Sun.).—Southend M.C. run to Great White Horse Hotel, Ipswich.

SEPTEMBER.

- 5th (Sat.).—Aston Hill climb of the Herts C.A.A.
 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

Secretaries of automobile clubs are invited to forward their programme of fixtures as soon as arranged.

BUSINESS NEWS.

BEFORE the Ipswich Engineering Society, last week, Mr. C. C. Morris read a paper on petrol engines and motor-buses.

PRATT's motor spirit was used during the 500 miles run of the three Cadillac cars on the Brooklands track in connection with the recent standardisation trial.

MR. B. C. JOY and Mr. Duncan Watson are hon. consulting engineer and hon. consulting electrical engineer to Messrs. Trevor, Ltd., the specialists in motor tuition, of 162, Great Portland Street, London, W.

THE Midland Rubber Company, of Ryland Street, Birmingham, have issued a new price list of their "Midland" motor tyres, "British" non-skids and motor rubber accessories. Several reductions are notified.

THE Motor-Car Equipment Company, of 55, Warren Street, New York, have just issued their 1908 catalogue of automobile supplies. Over 2,000 items are illustrated, described and priced, so that the list should be in the hands of every motor dealer and motorist.

WITH reference to the order for De Fornier tyre protectors for the self-propelled vehicles of the London Fire Brigade, reported in our last issue, Mr. W. J. Mayer, Chapel Place, Brompton Road, London, S.W., who introduced these protectors to this country, informs us that the contract was for five new sets for 4 in. tyres.

A COMBINATION which should be productive of a firm of all-round ability and absolute integrity is that of Lieut. R. G. L. Markham, M.I.Mech.E., M.I.A.E., late R.N., and Mr. H. Waymouth Prance, A.I.E.E., A.M.I.A.E., who have entered into partnership as consulting motor engineers (land and marine) at 143, Strand, W.C. Lieut. Markham is well known as a marine motor engineer, and has in addition had an experience in commercial motor vehicles dating back many years. Mr. H. Waymouth Prance has for some time past practised as a consulting automobile engineer, and his services have been made use of by many of our readers in the matter of expert examinations of second-hand cars. Messrs. Markham and Prance will, in addition to carrying out expert examinations, supervise maintenance, select second-hand cars, commercial vehicles and motor-boats, including superintending shipping for colonial clients, give technical and driving instruction, supply new cars, commercial vehicles, motor-boats, &c., of any make, and act as advisory engineers for the protection of clients' interests in land, marine, and air motor matters of every kind.

TO-DAY (Saturday) the Motor House will conduct auction sales in the Gilbey Hall of the Agricultural Hall, London—a new feature in connection with the Cordingley Motor Show, which should attract a considerable number.

WRITING of the Cordingley Motor Show, which has been open all the week and which closes at 9 p.m. to-day (Saturday), the "Motor Trader" says that "it seems clear that greater results have been attained by privately organised effort than the less elastic methods of the concrete trade associations concerned."

AS regards the New York-Paris run the latest news is to the effect that the Thomas car arrived at San Francisco on Tuesday, March 24th. The Thomas car has now placed 3,832 miles to its credit. The distances covered by the other competitors are as follows:—Zust, 2,636 miles; De Dion, 2,390; Protos, 2,226. There is no definite news as to the whereabouts and progress of the Motobloc.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, APRIL 4, 1908.

[No. 474]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

A CASE which has its interest for motorists generally has occurred at Pontefract, where a farmer was summoned on the information of a motorist for having created a highway obstruction by leaving hedge clippings on the road. The chauffeur to Mr. Rosslyn Halliday, of Featherstone Hall, said that he was journeying along the highway and the motor-car he was driving met with a puncture in consequence of the thorns on the highway. Going along the same place a week later he saw the thorns were still there, and reported the matter to the police. At the hearing of the case the magistrate's clerk said he failed to see how the thorns could be an obstruction. True, he observed, they were very objectionable, but hardly constituted an "obstruction" in the legal sense. Fortunately, the Bench, although they did not consider the particular case in question a serious one, were sufficiently awake to the possibility of its danger to inflict a small fine on the delinquent. The practice of leaving hedge-clippings on the highway, to be blown often for miles and cause untold injury to tyres, is so frequent that we are always glad to learn that motorists recognise the general benefit they can confer on the movement by taking action against people responsible for such ill-considered actions.

Lights on Motor-cars.

CONSIDERABLE activity seems to have followed the operation of the Lights on Vehicles Act, 1907, and although it is not concerned with motor vehicles, which are regulated, so far as lamps are concerned, by their own Act, the police appear to have made it an occasion for increased vigilance with regard to motorists. At Handsworth, near Birmingham, a driver of a car was fined for leaving his vehicle outside his house without providing it with proper lamps; and at Oxford a similar case has been brought before the courts. The matter is perhaps only a small one, but we would again emphasise to motorists the necessity of giving heed to this question, as neglect may not only mean enforced attendance at the police courts, but endorsement of the licence without magisterial option.

Motor-Cars in Municipal Service.

Now that several departments in connection with leading municipalities of the country are utilising the motor-car for their officers when engaged on visits of inspection and the like, the organisation of the service with a view to the allocation of expenses to the proper quarter is matter requiring some consideration on the part of the authorities. At Glasgow the Corporation recently appointed a special committee to frame regulations with a view of drawing up a scheme by which the total cost of each car should be charged proportionately to the department of the Corporation according to the number of miles which it has run in that particular service. They have now completed their labours, and in future the words "Corporation of Glasgow" are to be printed in letters of the same size and distinct-

ness as the existing identification mark. All cars attached to various departments are, in future, to be kept at the depots of the Tramways Department and put at the call of any of the Corporation officers, irrespective of their particular work in the past. To each vehicle a speedometer and milometer is to be affixed, so that at the end of the year the total mileage can be ascertained. The total cost of the running will be taken and the proportion of expenses charged to each department on the basis already mentioned. These regulations seem well framed to secure their end, and should also prevent, what has been heard of on this side of the Border, viz., the use of municipal motor vehicles for private enjoyment.

A Yorkshire Incident.

ONE of the incidents that bring ridicule upon the present position of automobile legislation occurred at Darlington a day or two ago, when the driver of a motor-car was summoned for exceeding the legal limit near that town. He was fined three guineas, although the evidence of the two constables who worked the trap in which he was caught prove that he was only driving at the rate of 20 miles 800 yards per hour. Granted that the apparatus was accurate, and the evidence of the police equally correct, the defendant was so little beyond what is allowed by the law that the result seems almost to savour of southern vindictiveness. So rarely have we had occasion to call attention to this phase of the matter in Yorkshire that we would suggest that the county automobile club might well take notice of any future occurrences of the kind, especially if they show any tendency to become general.

The Progress of Automobiles.

FULL of interest was the lecture which was given on "Recent Developments in Power Traction on Roads," by Sir J. H. A. Macdonald, K.C.B., to the members of the Royal Scottish Society of Arts a few evenings ago. He pointed out the advance as shown by the number of motor vehicles on the road and the multiplicity of journals concerned with the progress of the industry. It was a fact, which he had ascertained by his own observations in Edinburgh, at the hour of the morning when people were using their vehicles to go to business that the number of private motor-cars was greater than the number of private carriages. Taking twelve consecutive days, excluding Sundays, he saw on his mile walk in the morning fifty-two private motor-cars to twenty-three private horse carriages. Sir John had seen an even more marked advance during a week in the metropolis. He had observed that the numbers on the embankment from about twenty minutes to 10 a.m. to about half-past 10 o'clock were 1,011 motor-cars to 478 carriages. The idea that the motor vehicle was a luxury of the rich, and not a useful aid to the community, had been completely exploded, reference being made to the announcement given in a recent issue of the *M.C.J.* to the fact that the managers of the new Bangor Asylum had by a majority of twenty-four to four passed a resolution for the purchase of a motor vehicle as "necessary for the proper working of the institution." He noticed, too, almost daily the ambulance in front of the chambers of the Medical Officer of Health, and the Lord Provost had informed him that the paupers who were going to the House at Craiglockhart had a motor-car

provided to take them there; thus from the King downward the community were being driven in mechanically propelled vehicles.

The Influence of Brooklands.

ON the 25th ult. Mr. S. F. Edge read a paper before the Midland Automobile Club at Birmingham on some lessons which he has learned from the Brooklands track. First among these is the fact that with regard to tyres a certain degree of inflation is the most important point as against the previous instructions which were summed up in the words "pump hard." 100 miles of Brooklands track is, according to this authority, equivalent to something like 1,000 miles of ordinary running on the road, where tyres are concerned. So far as the improvement of engine cooling is concerned Brooklands should have a good effect. Smaller radiators can be used there than on the ordinary road owing to the high speeds attained forcing an enormous volume of air through the radiator. Mr. Edge then went on to refer to the various experiments he has carried out, and which have been previously chronicled in the *M.C.J.*, with regard to wind resistance, &c., concluding with an expression of opinion that the maintenance of Brooklands as a racing centre will constitute an important factor in the supremacy of the British automobile industry.

The 28-h.p. Daimler Car belonging to Dr. Sinclair White, of Sheffield, at the summit of the Buttertub Pass, between Swale Dale and Wensley Dale, in Yorkshire, 1,760 ft. above sea level. The owner is accompanied by Dr. Norman Walker, of Edinburgh, and Sir James Barr, M.D., of Liverpool.

Taxation and Prosperity.

NOT often do the gentlemen who perform formal opening ceremonies in connection with exhibitions show such a practical acquaintance with the object in view as did Sir John Bell, the Lord Mayor of London, in opening the Exhibition at Olympia on Friday of last week. Doubtless the very appropriate speech he made was inspired by the fact that he is a motorist, the happy possessor of a couple of good cars. He believed the motor-bus would, despite its rattle and its rumble, out-stay the tramcar. Touching on the taxation question, he trusted that neither this nor any other Government would penalise the rising automobile industry, for assuredly it would be undesirable for legislation to check its progress in any way. He would like to see the motor business take a very prominent part in the manufactures of this country. It had been proven already that, given the opportunities, we should be able to achieve that end. It was gratifying to hear Mr. E. Manville, as president of the Society of Motor Manufacturers and Traders, declare it to be the

opinion of that organisation that it was against all traditions of public policy to tax methods of locomotion, particularly when one class was singled out from the others. The effect which increased taxation might have was likely to be serious and far reaching, for it should be borne in mind that the industry employed several thousands of skilled workers in these islands, who would be the first to feel any check in the development of the movement.

A View to Urge.

THIS point as to the effect on industry any further taxation is one that should be kept well to the front. As Sir J. H. A. Macdonald pointed out the other day, the British motor movement was greatly handicapped by legislation a few years ago, and now that it has attained a position of prosperity scarcely seems an opportune time to give it a set-back. This is a point of view that should be appreciated by every section of the House of Commons, and the Parliamentary Motor party should take steps to bring it before all M.P.'s—whether Conservative, Liberal, or Labour.

Military Aeronautics.

THE retirement of Col. J. Templer from the Royal Engineers' balloon establishment at Aldershot on Monday is an event of national importance, for he has always taken an enthusiastic view of his duties. It was as long ago as 1877 that he put forward his plans for military aeronautics to the British authorities, and ever since he has been experimenting with aeroplanes, dirigible balloons and the like. Under his supervision "Dirigible No. 1" was built, this, it will be remembered, being the airship in which Col. Capper and Mr. S. F. Cody came from Aldershot to London last year. Throughout his official career Col. Templer constructed about a thousand balloons for the Army, and it is gratifying to learn that he intends to continue his study of aerial navigation. That his interest has in no way abated was shown last week, when he, with several other officers, made careful investigation of the exhibits at the Agricultural Hall, and spent some time on an examination of the eight-cylinder engine described on another page.

Lowestoft's Measured Mile.

MEASURED distances on the highway, as set forth by official order, are so generally suggestive of motorphobia that we heard with some perturbation that the Lowestoft Corporation was considering similar provision of a measured mile within its boundary. On inquiry, however, we are glad to discover that the matter is entirely a friendly one, and that the relations of the authorities of that town with motorists, are, to say the least, satisfactory. It appears that the Corporation has put down an accurate and plainly indicated nautical mile immediately north of the Ness Point, for the purpose of determining the speeds of motor-boats and power craft generally. This is an innovation that will be appreciated by motor-boatists, seeing that there is no sinister intent.

Taxation.

As we were going to press last week the Motor Union was holding a conference with regard to the subject of taxation, and the resolutions published on page 109 of our issue of the 28th ult. were unanimously approved. Lord Montagu announced that they might take it as a fact that the Chancellor of the Exchequer intended to impose extra taxation, however much they protested. This is a view to which we ourselves have given expression; and hence the point so freely urged that the first thing for motorists to insist upon is that such a step may have a disastrous effect in retarding the progress of the industry. We are not alone in this opinion, for at a largely-attended meeting of the general committee of the Scottish Automobile Club it has been resolved "that increase

of the present taxation of motor vehicles is unjustified." The committee followed this resolution with another to the effect:—"That, meantime, action on the part of the Club is inexpedient and uncalled for, but that the matter be remitted to the executive to take such steps, if and when, such additional taxation is proposed, as may seem to them proper to submit the views of the Club to the House of Commons, and to bring the influence of the members to bear individually upon their representatives in Parliament."

Irish Reliability Trial.

WHEN arranging the route for Irish Reliability Trial, the committee were anxious to include a suitable strand for a speed contest, in addition to hill climbs. It was also thought that the pleasure would be increased by including Killarney in the route, without in any way minimising the severity of the trial. With the former object in view it was at first thought advisable to run direct to Portrush, for a speed test on Magilligan Strand, returning to Dublin next day, and proceeding to Killarney on the following day. It has been realised, however, that three long daily runs following one another would impose unnecessary hardship on the drivers, and the Committee have been actively engaged in prospecting for a course suitable for the speed test which would obviate the three long daily runs of over 170 miles which the Portrush route would entail. Having ascertained that the strand at Rossbeigh, in Dingle Bay, co. Kerry, is quite as suitable as Magilligan Strand for a speed test, the Committee have decided in favour of the former. In order to reach the strand at low tide in the afternoon and to give a Sunday in Killarney, it will be necessary to proceed southward to Cork on Friday, May 22nd, reaching Rossbeigh Strand on the following afternoon, after which an hour's run will bring the cars to Killarney. This alteration in arrangements involves a change in the date of the commencement of the trial, which will not now commence until Friday, May 22nd (instead of on the previous day, as originally intended). This alteration will also permit of Belfast being included in the itinerary.

The Accident at Albourne.

AN unfortunate accident which occurred on the Brighton road on Sunday, causing serious injury to the passengers of a motor-car, is, as we write, the subject of police investigation. The accident took place at Albourne, and an examination of the wheel marks shows that the damaged motor-car was about a foot off the road, on the roadside turf, for some yards before the accident happened. To avoid collision with a hedgerow at a lane corner it was necessary for the chauffeur to get upon the road again, and at this point the overtaking car passed. The wheel marks then show a semicircle across the road to the ditch into which the damaged car was thrown. The driver of the latter vehicle has stated that he was travelling at a speed of about twenty miles an hour, and the deviation of his car off the road on to the turf was in anticipation of the passing of the faster car. The contact between the two was but "a touch"—possibly unfelt by the fast-travelling car, but sufficient to affect the steering of the car which came to grief. It is for a light-coloured vehicle that the police are now searching.

The International Touring Car Trial.

Now that some idea of the entries for the International Touring Car Trial is available, interest in that event should gradually quicken. The paper by Mr. Claude Johnson which has been read to the members of the R.A.C. will contribute to that end, and those who will participate in the test in any capacity, whether as competitors, drivers, observers, or passengers, will doubtless study it exhaustively. The general motoring public will be satisfied with a less thorough investigation of his review of the conditions of the Trial. The initial references in connection with the event were as to the definition of a car of a certain horse-power carrying a minimum number of passengers,

weighing not more than a certain weight, measuring a certain distance from the dashboard to the centre of the back axle, and presenting to wind resistance a minimum area in respect of body and wings. Subsequent discussion having settled the details of those four points, a process of elimination of various proposals brought the Trial to one of 2,000 miles of road travel, including twenty miles on hills and 200 miles on the Brooklands track, and the incorporation of the Scottish A.C., which latter, however, can also be entered as a separate event. Mr. Johnson gives the view of the motoring authorities that the Trial will correspond as nearly as possible with a race, subject to conformity with the law, and declares that it will (1) demonstrate which cars can run regularly, and (2) which cars of their class can ascend hills fastest; further, it will prove to what extent an owner must expect delay in his travels by reason of the necessity of replenishing the fuel tank, and, fourthly, it will demonstrate durability and resistance to wear and tear and to road shocks. With reference to the alleged severity of the Trial for small cars, Mr. Johnson showed that some of the manufacturers are of a different opinion, and concluded with regarding the forthcoming Trial as "the most practical, most enlightening, most comprehensive, and most important motor competition in the world."

Touring in Holland.—The Montalbanstoren, Amsterdam.

ON Tuesday, Mr. John Miles conducted an auction sale of carriages and motor vehicles at the Baker Street Bazaar, Portland Square, London, W.

ON Saturday the crew of the Newhaven motor-lifeboat were summoned for their quarterly practice. The boat was at sea about two hours, behaving splendidly.

THE motor course of the Brooklands A.R.C. will be re-opened to-day (Saturday) at 10 a.m. At 4 p.m. a private handicap sweepstakes will be run off over a distance of twenty-two miles.

MESSRS. MANN AND OVERTONS, LTD., the British agents for the Unic vehicles, have now arranged to supply their 12-h.p. motor-cabs to cabdrivers on the extended payment system, an arrangement which will enable individual drivers to run their own vehicles.

LAST week a strange adventure befell the 40-h.p. Napier car belonging to Mr. Marshall Roberts, of Easton Hall, Grantham. It was being driven home from Dereham, in Norfolk, and when at PODE Hole, about two miles from Spalding, had to cross several bridges over the watercourses that intersect the Fens. Crossing one of these bridges the car struck the masonry, carrying away about seven feet of it, and causing the car to overhang the parapet. In that perilous position it remained several hours, until, hoisted by ropes and pulleys, it was again placed on *terra firma* in a much damaged condition. Fortunately no one was hurt.

THE TAXATION QUESTION.

To tax, or not to tax; that is the question;
Whether 't is wiser on the car to suffer
The present ills in quiet subjection;
Or to anticipate a sea of troubles,
And showing fight, stop them? To speak; then silence,
No more: and, by a speech, to think we end
The matter, and all the incidental shocks
The road brings to us, 't is a consummation
Devoutly to be wished. To speak—then silence
The end! perchance our ruin: aye, there's the rub;
For in those silent hours what schemes may rise.

IN like manner Hamlet, had he been a motorist, might have soliloquised over the present aspect of the motoring body politic. There is no advantage in disguising the fact that the subject of further imposts on motorists has been mooted; that the Chancellor of the Exchequer has his eye on the motorist and—figuratively, of course—intends putting his hand into his pocket; that the motorist, by suggesting a use to which further taxes should be put, has given colour to the justice of increased licence fees—and that, altogether, the present unsatisfactory outlook is largely of his own making.

the Treasury is being strengthened in its desire to plunder the speediest portion of the community.

Of course it is alleged that the negative position is absurd and that the proper method of agitation is (1) to say we do not want more taxation, and (2) that if we are taxed we ought to have the disposal of the revenue. This is almost on a par with the victim of some Macedonian brigand suggesting (a) that he does not want to be robbed, but (b) if he is to be divested of his possessions he would like them handed over to a hospital or some other good cause. Surely the matter should be brought into the plane of justice and equity, and the whole subject dispassionately reviewed with a view of doing nothing to hinder a rising industry. If it can be shown that increased taxation is likely to lessen the demand for British productions, to check the advance of an important trade, and to prevent a development that recent progress has led us to expect, then no Chancellor of the Exchequer is justified in knowingly suggesting such an imposition. These points have been brought out in the *M.C.J.* from the commencement of the agitation; they will be considered in further detail next week in view of the near approach of the Budget.

The Turner-Miesse 10-h.p. Two-Seated Steam Car.

The anxiety of the various motoring organisations, and each goes one better than the others, has resulted in the current uncertainty; and many believe that the correct attitude has been expressed by the Scottish Automobile Club, which, having declared against further taxation, declines to modify its view by suggesting how further sums could be utilised. The impression is about that the motorist wants better roads, and is willing, nay anxious to contribute to their cost, and that the Chancellor will meet their wishes by taxing them pretty stiffly. In fact, there are some folks who believe that the motoring world will be disappointed if further taxation is not levied. That is the position; and how the motorist is to extricate himself from the *impasse* is now the problem. The conference last week presented no solution; in fact, it revealed an apathy and weakness that is not encouraging.

Apparently it was thought that the desire to tax motorists could be suppressed by a speech, or a few utterances and letters. But the subject once set afoot, "What schemes may rise?" Therein lies the damage, for all kinds of proposals are being made for the allocation of the new funds to be obtained from motorists. County Councils want some for road improvements, district councils are anxious that a proportion should be allocated for rounding corners at dangerous places, and rural councils would like the present voluntary erection of warning signs to become obligatory on the part of those who motor. Thus the claimants for the revenue from further taxation are increasing, and

THE TURNER-MIESSE STEAM CAR.

LOVERS of steam cars—and there are many—will be interested in the illustration we are able to give this week of the new 10-h.p. two-seated vehicle which has been put on the market by Turner's Motor Manufacturing Company, Ltd., of Wolverhampton. The generator, which is located under the bonnet in the fore part of the frame, is of the tubular flash type, similar in design to that which has hitherto been manufactured by the same firm. The condenser, which fills up the front opening of the bonnet, is of the tubular type, a belt-driven fan being provided behind it for cooling purposes. The burner which furnishes the necessary heat for the generator is of a new type, which has been found to give good results in the experiments that have been made with it; it is designed to use paraffin as fuel. From the generator the superheated steam is admitted through a foot-controlled throttle to the inlet valves of a horizontal three-cylinder engine located transversely at about the centre of the frame in such a way that the crank shaft is directly connected up through a universal joint to the propeller shaft, which drives the rear live axle through bevel gearing. At the forward end of the crankshaft is fitted a chain sprocket and also a crank; the former drives at a reduced speed a counter-shaft, on which is mounted an eccentric, which serves to operate the mechanical water pump. A hand-actuated water pump is also provided for starting purposes. The wheel base of the vehicle is 9 ft., and the track 4 ft. 1 in

GOSSIP FROM PARIS.

LAST week it was war to the knife between the French automobile world and the Ministry. In addition to the hundreds of thousands of petitions against the Bill for the policing of the roads sent out for signature by the Automobile Club to every village in France, and the threatening articles published in the daily sporting and even political journals of Paris, many leading automobilists talked of nothing less than upsetting the Cabinet or of at least hustling M. Barthou, the man responsible for the obnoxious proposals, out of his seat at the Ministry of Public Works. The motorists and journalists in conversation and in flaming leading articles failed to find epithets strong enough to express their indignation at M. Barthou's deliberate attack on the automobile industry. I heard some people even pretend that the Minister had by the Bill sought to assuage his anger at having been the victim of an automobile accident, but, on inquiry, I discovered such an accident never occurred.

All ill-will has, however, now vanished, the transformation scene is complete, the wolf is lying beside the lamb. I do not know whether M. Barthou was really alarmed for his seat in the Cabinet by the formidable agitation against him, but he took prompt and, as the event proves, effectual measures to preserve it. The first thing he did was to confer with the Committee of the Chamber to which the Bill had been referred. Of course, he could not absolutely repudiate it, but he explained that after all it was only a project, and could be modified. The object he had had in framing it was, he affirmed, the protection of the general public, and also reasonable automobilists, against the excesses of the madmen who by their furious driving brought discredit on a means of locomotion which had already rendered such signal services, and which would certainly continue to add to the riches of the land. There is not a single clause in the Bill which M. Barthou did not profess himself willing and anxious to alter, or even to suppress, if it could be shown that it was advisable. After that declaration the Minister signed and sealed peace with the automobile world by attending the annual banquet of the "Association of Sporting Journalists." In his speech at dessert he assured his hosts that his most ardent wish was to foster the automobile industry. If only those who are experts on the matter would give him advice, the Bill would be modified in such a manner as to make the projected new law a boon to the community at large, and the automobilists in particular. The measure must, he said, respect the interests of all Frenchmen. And now journalists, motor-car manufacturers and owners of self-propelled vehicles are united in singing the praises of the Minister at whom only a week ago they were hurling anathemas. In a word, they are shouting in unison, "Barthou is the man for us! Vive Barthou!"

The Steerable Balloon Company which has just been founded by the celebrated balloon constructor, M. Maurice Mallet, under the title of the Société Française des Ballons Dirigeables, is a venture to which everyone wishes success. The share capital of the company is only £20,000, which will most surely have to be considerably increased if the programme expounded by the directors is to be executed. The names of the directors, such as MM. Léon Desmarais, André Schelcher, Jules Armangaud, and Maurice Mallet, and the appointment of Comte Henri de la Vaulx as technical adviser, are valuable guarantees of the safety of the public, who will surely be tempted to make excursions in the car of the big omnibus steerable balloons it is proposed to construct, and the smallest of which is to have a capacity of about 5,000 cubic metres. M. Cailletet, the President of the Aero Club of France, told me the other day he considered steerable balloons could with advantage be made considerably larger than the "Patrie." It would not, he believed, be found difficult to keep the gasbag tightly inflated by means of yet more perfect compensating balloons, and thus made sufficiently rigid to resist the action of the wind when driven at a high speed. That opinion is encouraging for the new steerable

balloon company, which will perhaps before long create a regular daily service of omnibus balloons to carry British excursionists to St. Germain, Versailles, and then off to Fontainebleau and back to Paris in the same day, with stoppages at each of the towns to visit the chateaux. It would certainly be an improvement on the railway or the slow lumbering vans which ply between Paris and Versailles, and even on the four-in-hand coach. But that is not all the Steerable Balloon Company proposes to do. It will build military steerable balloons if it can get orders from the French military department or from foreign Governments, and will, at any rate, make little airships to carry one or two persons only.

The general requirements of the United States Government for military flying machines, as accepted by the Brothers Wright, Mr. Herring, and Mr. Scott, are regarded here as very hard. There are many aeronauts who wish to bet that no single flying machine will be constructed within the next twelve months capable of fulfilling them. They do not for a moment doubt of the progress being ultimately effected, but not so quickly. The Brothers Wright will, however, now at least have the opportunity of proving to the sceptical that they really accomplished the flights they boast of. But to remain an hour in the air without touching ground on a flying machine built to carry two persons and fuel for a flight of 125 miles is a feat which would mark the immediate and definitive conquest of the air by man. The timid flights achieved till now would fall into insignificance, especially if the flying machine fulfilled the other requirements of the United States Government, including the stipulation that "the flying machine should be designed so that it may be quickly and easily assembled and taken apart and packed for transportation in an army wagon. It should be capable of being assembled and put in operating condition in about an hour." The flying machine must also be able to descend without injury to any of its essential parts at any unprepared spot, such as a field, and then to take its flight from that unprepared ground unaided. Also, it must be provided "with some device to permit of a safe descent in case of accident to the propelling machinery." By tendering for the construction of such a machine the Brothers Wright have undertaken to deliver it within 200 days from February 1st, that is to say, at latest on August 18th next. It is to be hoped they will succeed, but, as I have said, great scepticism prevails in the aeronautic world here, and it has been rather increased than diminished by the announcement that the Brothers Wright have had seven motors of 30-h.p. each built by a foreign firm. These motors are said to have been already shipped to America.

Mr. Henry Farman's accident was fortunately not very serious. His aeroplane was smashed, but he escaped with a severe scratch on the nose and a blow on the upper lip. He was out the day after the mishap examining the wrecked machine and arranging with the Brothers Voisin for the prompt completion of a new aeroplane of the same type as his old one. He will recommence his trial flights without delay to prepare for his attempt to gain the "Graphic" prize.

MARNEY.

THE Greenan Laundry Company, Ayr, has placed an order with the Ayr County Motor Company for an Albion motor-van.

THE "Turnover Generator" has been placed on the English market by the Motor Accessories Company, to meet the demand for an apparatus to produce acetylene gas with economy, purity, and ease. Once charged the apparatus can be left for months without the slightest deterioration to the carbide or evaporation of the water, and when the time arrives for use, the only action required is the unfastening of one clamp and the turning over of the generator, which is supported on trunnions. Gas is instantaneously produced and the lamps can be lit immediately. When no longer required the generator is turned back to its normal position, and the production of gas immediately ceases. There is no after generation.

B

A RUN INTO HAMPSHIRE.

Not spring or summer's beauty hath such grace
As I have seen in one autumnal face.

SO says Donne; and now that cars are covered in, and, thanks to steel-armoured tyre covers, skids need not be feared, the owner of a car may proceed

Through autumn's fading realms to stray,
To see the heath-flower wither'd on the hill,
To listen to the wood's expiring lay,
To note the red leaf shivering on the spray,
To mark the last bright tints the mountain stain,
O'er the waste fields to trace the gleaner's way.

It is true as our faithful car carried us along by Knightsbridge the road was not inviting, and I quite confess we contemplated lingering and even staying under that sea coal canopy which so oft covers London and its wondrous tempting shops; but luckily the ladies mastered their desire to wander into the happy bargain-hunting grounds of Kensington High Street, and at Hammersmith we turned sharp to the left through Barnes, Roehampton, Richmond Park, with its ten-mile limit, on to police-trap Kingston. Luck or fog favoured us, however, and we soon passed through Bushey Park to that speed-inviting road to Staines without even one blue-coated gentleman holding up his hand. Egham, Holloway's College, Virginia Water, Sunningdale, and then along the dreary expanse of Bagshot sands to Blackwater, and so into Hampshire. Pretty lanes to the right lead to Yateley, with its restored Transition Norman church and traces of an anchorite's cell. A little further, and Charles Kingsley is brought to mind, for the author of "Westward Ho" was rector of Eversley, and his grave can be seen in the churchyard there. Keeping to the left, and leaving the common on the right, Bramshill is reached. Here there is a famous old Jacobean house, once built for a Prince of Wales. It is worthy of a halt, if only to see the fine firs in the surrounding park. Probably they will call to mind Kingsley's "My Winter Garden." Here, among the heather and densely packed small firs and gnarled giant trees, he loved to wander. At the eastern end of the house is the famous troco terrace, where once the old game was played. If possible, the fleur de luce bedroom should be seen, where the oak chest, the hiding-place and coffin in the "Mistletoe Bough," once stood. It was in this house that, in repairing part of an interior wall, an original letter of Oliver Cromwell's was found behind the wainscot.

The road should now be taken by Heckfield Place; a little beyond is the Wellington Monument, a bronze statue of the Duke by Marochetti, which was erected in 1866 at a cost of £3,000. Turning to the left, Strathfieldsaye is soon reached; the house and park were purchased from the Rivers family and presented by the nation to the Great Duke in 1815. Of the approach on the north side, which is by a mile long avenue of elms, Rogers says:—

These are the groves a grateful people gave
For noblest services, and from age to age
May they to such as come with listening ear
Relate the story.

The general effect is indeed fine, and scattered about are some grand old oaks and thorns, and amid it all the slowly flowing Loddon wanders, in places expanding into sheets of ornamental water in which the reflection of the brown and gold on the bright autumn day when we were there alone repaid the journey. The house is of the Queen Anne period and contains an interesting portrait by Barker, in which the Duke is depicted

descending the Pyrenees together with Marlborough and Washington. Part of the hall floor is made of mosaic pavements obtained from Silchester. Here is the flag by the annual delivery of which on June 18th at Windsor the estate is held. The Duke of Marlborough pays, I believe, a similar rent for Blenheim. In the library over the fireplace there is an excellent portrait by Sir Thomas Lawrence. In the grounds, near some splendid tulip trees, is buried Copenhagen, the charger which carried the Duke at Waterloo. The Duchess, it is said, always wore a bracelet made of his hair. The north road over the Loddon should next be taken, passing the grass-grown old Roman London-Silchester road. Four miles, and the now silent and desolate British town of Caer Segeint, or, as the Romans called it, Silchester, is reached. In the farmhouse close to the church are the famous fifteenth century old walls surrounded by a dry moat. A temple as well as the Forum have been unearthed. From articles found, the site of ancient shops have been more or less correctly made out; money-lenders, as well as butchers and fishmongers, must, it is thought, have carried on their trades in the insulae or blocks of the old city. Like Pompeii, many details remain showing that sudden destruction must have overtaken the town; but, as no Lytton has weaved a romance about it, the British public seem to prefer to wander abroad and to there explore Roman remains, though they have as interesting ones close at hand in their own country. Truly does Wolcot

say:—

Rare are the buttons of a Roman's breeches,
In antiquarian's eyes surpassing riches;
Rare is each cracked, black, rotten, earthen dish
That held of ancient Rome the flesh and fish.

Anyway, those who are interested can see in the museum some certainly rare coins and specimens of pottery and mill stones. The parish church is built of some of the old Roman stones, and contains a carved oak Perpendicular screen, and a sixteenth century altar table. In the churchyard there is a fine spreading yew tree, with surrounding elms, that recalls those lines of the poet Gray:—

Beneath those rugged elms, that yew tree's shade,
The rude forefathers of the hamlet sleep.

(To be concluded.)

MR. A. WHALEY has added to the equipment of his motor-car garage and repair works at Forres, and, in addition to keeping a stock of accessories and motor spirit, he has also a vulcanising plant for dealing with tyres. Mr. Whaley has latterly been busily at work in converting several large rowing boats into motor-boats, for Scottish sportsmen.

THE Flash Antiseptic Cleanser, as its name indicates, is a preparation for removing grease, dirt, &c.; from the hands of motorists. Flash is not a soap in the ordinary sense of the word, as it only contains glycerine, with a neutral oil, a small amount of chemically pure soap stock, and a little finely-ground pumice. This new hand-cleaner is thoroughly antiseptic, and combines the action of a good detergent with the emollient properties of cuticle soap. Although the pumice makes a feeling of grittiness the skin is not abraded nor rendered rough as when soda is a constituent. If the hands are covered with heavy black grease, ink, acid, or chemical stains, they should be rubbed with a little Flash, and in less than a minute they will be absolutely clean. It may be used with hard, soft, cold, hot, and salt water, and, in extreme cases, without any water at all. Messrs. Brown Bros., Ltd., have taken up its sale to the motor trade.

Eversley Church.

THE Transvaal A.C. has become affiliated with the R.A.C.

MR. MONTAGUE LUSH, K.C., has acquired a 30-h.p. six-cylinder Coventry-Humber landaulet.

IN reply to several correspondents, we have to announce that the dates of the 1909 Cordingley Show are March 20th to 27th next.

THE address of Messrs. James Neale and Sons, Limited, makers of the wind screen joint illustrated in our last issue, is Graham Street, Birmingham.

QUESTIONS concerning motor-buses in London continue to be addressed to the Home Secretary, but no information beyond that reported last week has been given.

SHOULD the Sunday Closing (Shops) Bill leave the House of Lords in the form in which it has been introduced, those who sell petrol, &c., on Sundays will find themselves prohibited from further transactions on that day.

IT has been settled definitely that Messrs. Warwick Wright, D. Resta, and Moore-Brabazon will drive the Austin cars in the forthcoming Grand Prix race.

LORD BRASSEY, G.C.B., has ordered a 25-30-h.p. Vulcan car from the London and Parisian Motor Company, Ltd., who are also supplying a 16-20-h.p. Hotchkiss car to Lord Alastair Kerr.

ON the 13th inst. Local Government Board Orders for the restriction of the speed of motor-cars to ten miles per hour will come into force in certain thoroughfares in Rickmansworth, Barnes, East Molesey, and West Molesey.

OUR contemporary "Truth," which, by the way, had very complimentary reference to the Show at the Agricultural Hall last week, asks, "When is a Master of the Motors to be added to the other functionaries of the British Royal House?"

IN fining a chauffeur summoned at Woolwich on Tuesday for exceeding the legal limit in Charlton, Mr. Baggallay, the magistrate, refused to allow time for payment—a policy that is apparently becoming general with Metropolitan magistrates.

TWO gentlemen and a mechanic were severely burned about the hands in extinguishing a fire which broke out in a motor-car near Manchester the other morning. The car was not much damaged by the outbreak, which was attributed to an escape of petrol.

IN our Correspondence columns are some interesting letters with regard to the dust question, a matter again brought to the front by the lately issued report of the R.A.C. Dust Trials Committee. The subject is one upon which our readers are invited to give their views.

THE judges in the New Zealand Reliability Trials organised by the Canterbury (N.Z.) Automobile Association awarded the first prize for "cars under 12 h.p.," the prize for "the most meritorious performance in the whole trials," and a special prize for "the best performance of any car selling in England for less than £350," to a Dunlop-tyred 10-h.p. Cadillac.

THE sympathy of motorists generally will be felt with Mr. C. D. Rose, M.P., in the loss of his son. It will be remembered that the serious illness of young Mr. Rose was the cause of the absence of the chairman of the R.A.C. from the annual dinner of the A.A. We regret, in common with all who knew him, the sudden death of a promising officer in the Royal Horse Guards.

UNDER the title of "Everything for Motorists," a new price list, extending to 120 pages, has been issued by Messrs. A. W. Gamage, Ltd., of Holborn, E.C. The alphabetical index extends to twelve closely printed columns, and hundreds of illustrations are scattered throughout the work, which is one of the most complete we have seen. The section devoted to lamps and the numerous sundries connected therewith is most comprehensive, and an interesting page is that on which the many types of non-skid tyres and devices are illustrated, so that the motorist can have a review of the whole field before making a final selection. Tools and accessories are also exhaustively treated, and the electrical section deals with everything that the motorist is likely to require.

THE Post Office night mail between London and Dover is to be carried by motor-vans, which will leave each terminus every night.

REPLYING to a question in the House of Commons, Mr.

Burns has announced that he cannot promise to introduce legislation on motor-cars during the present session of Parliament.

THE Mabout Club has been formed in Los Angeles, Cal., U.S.A., with the object of endeavouring to put a stop to the reckless driving and scorching that is bringing bad repute to automobilists throughout southern California.

EVERY motorist is aware that the general public have very hazy ideas of the speed of motor-cars, but some of these mistaken ideas should be removed by the appearance of the instrument illustrated in the accompanying photograph, which shows the actual speed attained by a vehicle in a vivid and convincing manner. This huge instrument has been constructed by the Cowey Engineering Company, Ltd., the makers of the well-known Cowey Speed Indicators, with the object of giving to motorists and the public generally an accurate idea of the speeds of various vehicles travelling along the public roads, and with a view to demonstrating the accuracy and reliability of the speed

indicator in question. The indicator itself consists of four dials. The two side ones are 4 ft. in diameter, the back one 2 ft. 6 in., and the small index dial in front 9 in. The pointers of all four dials are operated by bevel gears off a central shaft, and it is surprising to know that this shaft, which operates all the pointers, is actually driven by one of the firm's ordinary speed indicators made about half as big again as the normal size, i.e., 6 in. in diameter. The whole apparatus is driven, as are all Cowey indicators, by means of bevel gearing and a special chain drive from the road-wheel, in this case the left. On the off-side of the car is operated one of the firm's standard indicators, the readings of this and the giant indicator having proved identical from the first time they were attached to the car. The huge instrument is mounted on an 18-h.p. Siddeley car, which we learn is doing its work without trouble of any kind. The Cowey Engineering Company will at all times be willing to give their services with this novel instrument for the purpose of demonstrating the absurdity of some of the proposed speed limits, in cases where such are being opposed.

FROM Messrs. T. J. Harman and Co., of 26, Regent Street, London, S.W., comes a copy of the new catalogue of Vinot cars; this gives full particulars of the various models—viz., 12-16-h.p., 16-24-h.p., and 30-45-h.p. four-cylinder, and 40-65-h.p. six-cylinder. The illustrations comprise pictures not only of the different chassis, but also a number of outline drawings, giving an idea of the various types of bodies that can be fitted to the vehicles.

AN up-to-date parcel delivery service by means of motor carrier cycles has been started in Albuquerque, N.M., U.S.A.

THE Torking Tyres (Patent Syndicate), Ltd., has intimated its intention of entering for a 5,000 miles trial of these tyres, to begin during the present month.

WE illustrate herewith the new adjustable spanner lately introduced by the Birmingham Small Arms Company, Ltd. Like their other productions, these spanners are made of the highest quality, the simplicity of action being a most noticeable

feature, besides which the neatness of design and effectiveness of the tools under all conditions must bring them into public favour. The spanners are made in two sizes. The small one, measuring $5\frac{1}{4}$ in., is particularly suitable for cyclists and small mechanical work, while the larger size, measuring 11 in. over all, is intended for the use of motorists and engineers generally.

MR. FREDERIC COLEMAN has taken over, on behalf of the White Steam Car Company, a newly-erected repair works just off the main street at Camden Town, by Mornington Crescent Station. The building has a superficial floor area of a million feet.

A PATENT has been taken out by two Liverpool motorists for a method of deodorising the exhaust from petrol motors by passing it through a cage or retainer containing a quantity of carcarilla bark, with or without additional substances, such as tonquin bean or soda-lime crystals, to impart a pleasant perfume to the gases.

THE new motor showroom of Messrs. Benetfink and Co., 107 and 108, Cheapside, London, E.C., is now complete. This has recently been extended and removed to a much more prominent position on the ground floor of the establishment, where there is a full stock of all motor specialities such as has made the Holborn house of Messrs. Gamage, Ltd., so popular.

WE had an opportunity the other day of making a short trial run on a car fitted with what is known as the lever spring suspension, which has been brought out by the Lever Spring Suspension and Engineering Syndicate, of 13, Grape Street, New Oxford Street, London, W. The arrangement is not a shock absorber in the accepted sense of the word, but rather an additional springing device arranged to meet the high frequency vibrations ordinarily set up under bad road conditions. The common design of motor-car spring is admittedly slow in recovering from displacement, and although much of this vibration is absorbed by the tyres, yet a comparatively large amount is transmitted to the chassis. It is claimed for the new suspension that, by the employment of a swinging lever, acting against a coiled spring, a method of springing is obtained which, while giving the necessary amount of movement to absorb all the smaller shocks, possesses the quick recovery which is absent with ordinary springs. The invention consists briefly in a bell crank lever, to the short arm of which the rear end of the ordinary spring is shackled, instead of to the usual bracket or hanger. The longer arm of this bell crank works against a flat coiled spring, the centre of this being attached to the fixed centre pin, about which the bell crank rocks. This centre pin is clamped by a bolt to the bracket or hanger, bolted to the frame, and, therefore, takes the place of the usual direct shackled connection. Stops are arranged on the bell crank to limit the movement, the object being to prevent over-stressing of the coiled springs when a large obstacle is met. In this way the greater part of the shock is, it is claimed, thrown on the main plate springs, which are better adapted to receive impacts of this nature. In the course of the trial run we made some bumpy roads were encountered, over which the car ran with little or no discomfort to the passengers. The device, which is being exhibited this week at Olympia, is well worthy of inspection.

THE Daimler Company have received an order from Prince von Saxe-Weimer for a 45-h.p. phaeton.

THE Durham and District Omnibus Company has apparently failed in its endeavour to secure a motor-omnibus service for the city of Durham.

ON Sunday the Queen and the Empress Marie of Russia motored to Brighton, returning to town in the early evening, thus joining the ranks of those who regularly enjoy a motor run from London to its seaside prototype.

THE municipal authorities of Berlin have recently purchased a N.A.G. 18-20-h.p. motor-lorry capable of carrying five tons, to be used for transporting tools used in street cleaning. The chassis is so arranged that it can also be fitted with a large water tank for sprinkling purposes, if desired.

WE learn that Messrs. J. Keele & Co., of New Bond Street, W., have been appointed official repairers for Belsize cars in London. They have on view at their depot one of the new 1908 Belsize 14-16-h.p. four-cylinder cars, and also one on which they are prepared to give trial runs to intending purchasers.

ACCORDING to the Fire Committee of the Municipal Council of Springfield, Mass., U.S.A., the four automobile fire service wagons in the department there, locally known as the "flying squadron," save the city over £40 per year, as compared with the cost of horse equipment. The Commissioner therefore recommends the purchase of three combination chemical and hose automobiles to replace horse-drawn apparatus.

WE illustrate herewith a new ignition accumulator known as the "G. B.," which has lately been put on the market by the County Chemical Company, Ltd., Excelsior Works, Birmingham. The positive plates are of an improved Planté type, i.e., the active material is electrolytically formed out of the lead; no paste is used, so that internal short circuits are obviated. The negative plates consist of a special form of spongy lead contained in a robust type of undercut grid. All terminals are covered with an alloy to render them acid-resisting. To prevent creeping and corrosion of the thread, the lugs of the celluloid cells pass through grease cups. The positive terminal is coloured red, and the negative black. The special feature of the accumulator is its patent discharge indicator. This useful adjunct consists of a tube visible from the front of the cell containing four coloured glass beads. According to the number of beads floating, the state of the cell in respect of discharge is

automatically indicated, and can be ascertained at a glance. The following are the indications given:—

- | | | | |
|----|------------------------------|-----|---|
| 4. | Red, blue, dark blue, purple | ... | Specific gravity has risen above 1.220. |
| 3. | Red, blue, dark blue | ... | Charged. |
| 2. | Red, blue | ... | About a quarter discharged. |
| 1. | Red | ... | two-thirds " |
| | None | ... | Discharged. |

The accumulators are made up in celluloid boxes in 4-volt sizes, from 16 to 80 ampere-hour capacity, and in teak lead-lined boxes, from 72 to 126 ampere-hour 4 volts, and from 90 to 126 a.h. 6 volts.

CONTINENTAL NOTES.

The A.C.F. Grand Prix Race.

The first of the new cars which the Brasier Company are building for this year's A.C.F. Grand Prix race is now on the road. The vehicle is fitted with a four-cylinder engine, 155 mm. bore by 160 mm. stroke. Three speeds and a reverse are available, a direct drive being obtained on the top speed to the differential shaft, from which the transmission to the rear road wheels is by side chains.

Hill Climbing in Bohemia.

The Automobile Club of Bohemia held a hill-climbing competition last week over a five-kilometre course on the Zbraslav-Jilovischt road, near Prague. The event was well patronised both as regards the number of competitors and also the spectators, among the latter being the Archduke Karl Franz Josef. The best time of the day was made by Joerns on one of the cars which the Opel Company, of Russelsheim, Germany,

Motor-Car Racing in Spain.

The "Mundo Deportivo," of Barcelona, is organising a light car race for May 28th, to be held over a 250 kilometre circuit in the neighbourhood of that city. The competing vehicles will be divided into three classes, viz., (1) single-cylinder cars up to 100 mm. bore and weighing not more than 500 kilog.; (2) two-cylinder cars of a maximum cylinder bore and weight of 80 mm. and 600 kilog.; and (3) four-cylinder cars 65 mm. bore and 650 kilog. Three Peugeots and three Gregoires have already been entered for the event.

Accidents in France.

The Automobile Club du Rhone has issued a return of the accidents which have occurred in the Departments of Rhone and Ain between January 1st and March 20th last. Railway accidents were 36 in number, causing the death of 9 persons and injury to 19 others; 69 tramway accidents resulted in 4 deaths and 48 injured; horse-drawn vehicle mishaps brought about the death of 8 persons and injury to 110 others.

Joerns at the Wheel of the Opel Grand Prix Racer on which he won the Hill-Climbing Competition recently held near Prague, Bohemia.

have built for this year's A.C.F. Grand Prix race. His time for the five kilometres was 3 min. 55 sec.

Speed Trials in Algeria.

The Automobile Club of Algeria is organising a series of flying kilometre speed trials for the 12th inst. It will be held on the road between Algiers and Boufarik, the usual categories being provided for. A special cup is being offered to the competitor who makes the best time of the day.

New Brasier Vehicles.

It is reported that the Brasier Company are taking up the construction of light cars—a single-cylinder two-seated vehicle and a light two-cylinder car. Both machines will have cardan shaft transmission.

Motoring Regulations in Belgium.

Some new regulations with regard to motor traffic are about to come into operation in Belgium. A speed of 45 kilometres (28 miles) per hour will be allowed in the country, but this must be reduced to 18 kilometres (11½ miles) when passing through villages. The use of headlights in towns, as also sirens and whistles, is prohibited.

Finally, the number of automobile accidents, in which 13 persons were injured, was 24; no deaths, however, occurred.

Miscellaneous Items.

The second general meeting of the International Motor Yacht Association was held in Amsterdam last week, when certain modifications were made in the rules which will allow every nation to be fully represented on the body.—The Verein zur Förderung des Gewerbelebens of Berlin is offering a prize of £150 and a silver medal for the best method of utilising the fuel in internal combustion engines with the least possible amount of smoke and smell.—Prince Bibesco, one of the leading motorists of Roumania, has lately acquired a 75-h.p. six-cylinder Mercedes.—It has been definitely decided that Cagno, Fabry and Henry Fournier will drive the Itala cars in the A.C.F. Grand Prix race.—Two new motor papers are about to see the light in Paris; one, known as "La Voiturette," is to deal with light cars; the other, the "Courier des Mecanos," will appeal more especially to motor-car drivers and mechanics.—The annual Small Inventors' Show was opened in Paris on Sunday last. Several new devices for the starting of the engines of cars from the driver's seat are on view, as also several two-cycle engines.

The Cordingley Motor Show.

(Continued from page 105.)

BELOW we continue our report of the various stands at the Cordingley Motor Show at the Agricultural Hall, London, which closed on Saturday last.

The Peugeot Cars.

In addition to the new Pick cars described in our last issue, the EARL'S COURT MOTOR AND GARAGE COMPANY, LTD., had on view several examples of the latest types of Peugeot cars. Prominent on the stand was an 18-24-h.p. car, with specially finished body, by Million-Guiet. The engine comprises four cylinders, cast in pairs, with the valves arranged on opposite sides. The mixture is furnished by the Peugeot Company's special automatic carburettor, while the ignition is by low-tension magneto. The four-speed change-speed gear is "gate" controlled, and the final drive is by side chains. All the details have been carefully thought out, and, needless to add, ball bearings are fitted to all parts except the engine. An 18-24-h.p. car fitted with a roomy side-entrance body by SALMON was also shown. Of the Peugeot 8-11 h.p. single-cylinder vehicles, several were on view, including a

can be fitted. The clutch is of the multiple disc pattern, the shaft connecting it with the gear-box being jointed. The change-speed gear is "gate" controlled, and the final drive is by short side chains. Special attention has been paid to the brakes, the usual pair on the hubs of the rear road wheels being supplemented by two brakes, both operated by one pedal, on the differential shaft. Other cars on view included a 50-65-h.p. chassis and a 16-22-h.p. car with limousine body. These are on similar lines to the 40-45-h.p., the main alteration being in the arrangement of the foot brakes, there being one on the differential shaft and one on the forward end of the gear box side shaft. The Isotta-Fraschini cars are among the high-grade productions of Italy, and have already earned an excellent reputation in this country.

The Pope Tribune Car.

The SERVICE COMPANY, LTD., of Featherstone Buildings, High Holborn, W.C., were present with an example of the Pope Tribune 14-h.p. car, which is being offered at a relatively low price. The engine is of the two-cylinder type provided with coil and accumulator

A View in the Aeronautical Section in the Gallery.

handsome two-seated victoria, a two-seater with racing-type body, and a double phaeton. Another exhibit of interest at this stand was the A. W. Hemmings wind screen, which allows, through a simple appliance, the device to remain raised in rainy weather without obstructing the line of sight, at the same protecting the occupants from the inconvenience of the bad weather. This is made possible by forming on the glass screen in the line of sight an aperture made to any desired dimension, so that the driver can see through in rainy weather or by night. This aperture can be swung out of the line of sight and closed by a small shutter made of glass or celluloid, so that the line of sight is always quite clear.

The Isotta Fraschini Cars.

Three examples of the well-known Isotta-Fraschini cars were displayed by Messrs. HALL, CAPRIS AND CO., LTD., a prominent position being given to a polished chassis of the 40-45-h.p. model. The engine comprises four cylinders, 130 mm. bore by 150 mm. stroke, cast in pairs, with the valves arranged on opposite sides. The water circulation is maintained by a pump driven off the exhaust-cam shaft. The ignition is by Eisemann high-tension magneto, while the carburettor is of a special automatic type. To facilitate the starting of the engine, a half-compression device is provided, while, if desired, a self-starter

ignition. The transmission is through a leather-faced cone clutch, cardan shaft and bevel gear to a live axle. The lubrication is effected by a Hill precision oiler with five leads, one of which feeds each cylinder, one the front and one the rear bearing of the engine, and one the crank case. A partition is formed in the base chamber which provides each crank with its own oil well. The frame of the vehicle is built of angle steel, and is supported on long, semi-elliptic springs; the body is of the side-entrance double-phaeton type. The SERVICE COMPANY also had a display of the well-known "Service" and "Service Billet" detachable non-skid and tyre protectors. The covers, which are made of the finest quality leather, treated by a special process, consist of two parts, the casing and the tread. The casing is shaped to the tyre and practically encloses it, but it is constructed in such a way as to allow ample cooling. On either side loops are formed to contain the metal segments and adjusting screws which hold the cover in place, and permit of its being attached or detached in a few minutes. The segments permit of adjustment to take up any slack in the leather, thus allowing the cover to be always kept tightly in place, at the same time giving free play to the tyres. To the casing a special form of tread is fixed in such a way that there is no possibility of the rivet ends chafing the tyre, while at the same time permitting of its being easily removed and an entirely new tread fitted when occasion requires.

The "Maja" Cars.

Considerable interest was shown in the "Maja" cars exhibited in London for the first time by the MAJA COMPANY, LTD., of Conduit Street, London, W. The vehicles, which are built by the Austrian Daimler Company, comprise a number of special features. Two cars and a chassis were staged, all of 28-35-h.p. The engines comprise four cylinders, cast in pairs, the bore being 110 mm. and the stroke 130 mm. The mixture is provided by an automatic carburettor of special design, the throttle being controlled both by hand and foot levers. Ample brake power is provided, the usual hand-operated brakes on the rear wheels being supplemented by two separate brakes on the differential shaft, operated by different pedals. The ignition is by low-tension magneto, simplification being introduced by working the make-and-

Fig. 37.—Chassis of Maja 28-35-h.p. Car.

breaks from a single vertical shaft, having a cam at the top controlling two horizontal spindles in either direction. In this way a single cam, which runs in grease, effects the ignition in all four cylinders. Another new feature is the lubricator, in which all springs are avoided, the pump being worked through a small cardan shaft from the half-time shaft. The clutch is of the metal-to-metal type, and the change-speed gear is "gate" controlled, and gives a direct drive on the top fourth speed. The final transmission on the cars on view was by side chains, but a chainless model is also made. The complete cars on view included a special 28-35-h.p. limousine, having accommodation for six persons, the body-work being by Messrs. Cockshoot and Co., of Manchester, and

their rear ends attached to a cross-bar. The motive power is supplied by one of the Coventry Simplex 10-h.p. two-cylinder engines, the bore and stroke being respectively 3½ in. by 3½ in. Large water-jackets are provided, while the water circulation is on the thermo-syphon system. The radiator is somewhat on Renault lines—that is to say, it is located in front of the dashboard and at the rear of the bonnet. To allow, however, a good draught of air between the ribbed tubular pipes, the sloping footboard is brought almost to the top of the dashboard. The

Fig. 38.—The Motor of the Maja 28-35-h.p. Four-Cylinder Car.

mixture is furnished by a special form of automatic carburettor, the extra air-inlet valve being provided with a dashpot. The ignition is by coil and accumulators, provision being, however, made for the fitting of a magneto where desired. Special attention has been devoted to the question of rendering the various parts accessible and readily detachable. The carburettor can be taken down and put back by anyone who can use a spanner in ten minutes, while the jet, throttle, and air-valve are all independently removable without disturbing anything but the part needing attention. The transmission is through a leather-faced cone clutch and a three-speed and reverse gear-box. The shafts of the latter run on ball bearings; the box itself is a single aluminium

Fig. 39.—Chassis of Staines-Simplex 10-h.p. Car.

a three-quarter landaulet to seat seven, the body-work of which is by the Daimler Motoren Gesellschaft, of Unterturkheim.

The Staines Simplex Cars.

The principal exhibit of interest at the stand of Mr. DOUGLAS S. Cox, West Norwood, was the chassis of the new 10-h.p. Staines Simplex Car (Fig. 39), built by the Staines Motor Company, Ltd., of the London Road Works, Staines. The car, which can be fitted with a two or four seated body, has a pressed steel frame. Semi-elliptic springs are employed at the front and three-quarter-elliptics at the back. The latter are, however, not connected together, but have

casting, provided with a large and readily-detachable lid. The final drive is by a cardan shaft, with joints at each end, and bevel gear, to a well-designed ball-bearing live axle, the weight of the car being carried on the axle casing. The universal joints are of a special design, the pins being adjustable to allow any wear to be taken up. Altogether, the new car will well repay inspection. Mr. Cox also had on view a Peugeot 18-24-h.p. side-entrance car, with side entrance double phaeton body, a Peugeot 8-11-h.p. two-seated car, an Adler 4-h.p. twin-cylinder motor-bicycle, and a Douglas 2½-h.p. motor bicycle with horizontal engine.

The Renault Cars.

Among the French cars at present on the market, none are enjoying a greater popularity in England than the Renault vehicles, several examples of which were shown by the Metropolitan Garage Association, of Palace Street, Victoria, London, S.W. The exhibit comprised a 20-30-h.p. chassis, a 20-30-h.p. limousine, a 14-20-h.p. landaulet, and a 10-14-h.p. two-seater. As regards the mechanical details of the chassis, the 1908 models do not vary from those of last year, except in small

Fig. 40.—The Renault "Sedan Chair"

details, the familiar dashboard radiator and sloping bonnet being still retained. The engines drive through a special form of leather face cone clutch, the Renault gear-box, cardan shaft and bevel gear to a live axle (Fig. 41). The body-work of the cars exhibited was both of smart design and high-grade construction. Special reference may be made to the 14-20-h.p. landaulet, with body by Messrs. Thrupp and Maberly, seating four inside and two out. A special feature of the design is a light folding hood over the driver, instead of the usual extension, thereby keeping down the weight, and allowing for luggage carrying capacity on the grid at the back of the chassis. The great novelty of the stand, however, was the 10-14-h.p. car (Fig. 40), fitted with a body on the lines of an old "sedan chair," painted a pale green, and upholstered to suit. As will be seen, the vehicle is arranged to be driven from the inside, a folding seat being provided at the rear to accommodate an attendant. The windows are of ample proportions, while by a system of small louvres ventilation is secured, whilst the outside sounds can also be heard. Altogether, this was one of the prettiest bodies in the Show, the dummy C-spring suspension greatly enhancing the effect.

Fig. 41.—The Renault Back Axle.

Motor Tools.

In the Gallery, Messrs. AVERY AND ROBERTS had a large show of general motor accessories and tools of really considerable ingenuity in their design. One useful appliance is a double-ended box spanner with a tommy handle, which fits most standard sizes of plugs. The Auto Nut Pliers are a combination nut plier, wire cutter, nipper, and ordinary plier. By its means nuts can be reached in various awkward places where it is impossible to work with ordinary spanners and ratchets. Motor Cone Pliers of various sizes were also shown, as well as the Auto

Adjustable Box Spanner, which does the work of the largest set of box spanners, and is a really indispensable tool. We illustrated on the 21st ult. the Auto Ratchet Spanner, which is supplied with adapters in leather case. Each of the four adapters separately fit in the $\frac{1}{2}$ -in. ratchet spanner. This tool takes five sizes of nuts, from $\frac{1}{4}$ -in. to $\frac{1}{2}$ -in., and is light and portable to carry. The adapters are also made in French sizes, and Messrs. Avery and Roberts, Ltd., whose headquarters are at 64, Stanley Street, Liverpool, completed a very representative display of tools with a selection of their well-known tool kits containing all the tools usually required by the motorist in difficulties on the road.

The Standard and Sizaire Cars.

The exhibit of Messrs. SCOTT RUSSELL AND BRÉE, of High Street, Lewisham, S.E., consisted of a Sizaire 9-11-h.p. two-seated car and a Standard 20-h.p. six-cylinder side-entrance double phaeton. The Sizaire is an interesting single-cylinder vehicle of French construction, the design comprising a number of novel features, which have already been dealt with in these pages. Among these may be mentioned the special system of frame construction and suspension, the clutch, and the transmission gear. The Standard car, of the chassis of which we give a view in Fig. 42, is built by the Standard Motor Company, Ltd., Coventry. The cylinders are cast in pairs, with the valves arranged all on one side; the dimensions are $3\frac{1}{2}$ in. bore by $3\frac{1}{2}$ in. stroke. The bottom half of the base chamber can be detached without disturbing the crank shaft bearings. The ignition is by high-tension magneto, gear driven off the same shaft as the water pump. A feature of the automatic carburettor is the ease with which the various parts can be detached for inspection. The lubrication of the motor is effected by gravity through a sight-feed rack on the dashboard. The clutch is of the metal-to-metal type, consisting of a single plate held between the flywheel and a floating ring.

Fig. 42.—Chassis of Standard 20-h.p. Six Cylinder Car.

The gear-box is very compact, reducing the length of the shafts to a minimum. The three speeds and reverse are controlled by a lever working in a "gate." On the top speed the drive is direct through a cardan shaft to the live axle. The universal joints are of a special design. They are exceedingly simple, but somewhat difficult to describe, in the absence of illustrations. It may be stated, however, that no pins or nuts are used in the construction. By loosening one bolt, the cardan shaft can be readily removed from the chassis, the bevel pinion being detachable with equal facility. The differential gear is of the spur pinion type; the casing surrounding it is fitted with a large detachable cover at the rear, to enable the gear to be examined. Ball bearings are used throughout the gear-box and axles.

Tyre Patches.

To motorists generally the novelties shown by Messrs. WOODGATE BROS., of Tiverton, appealed as of practical interest. They consisted of the "Patchquick" Duplex Motor Patches for the repair of inner tubes, and can be fixed in five minutes. The method of securing them to the tyre ensures a thorough amalgamation, so that they will not creep or come off when the tyres get hot. All that is necessary to fix them is to clean the inner tube in the immediate locality of the puncture or burst with either naphtha or sandpaper; a coating of "Patchquick Fix" is then well rubbed into the tube and also to the patch. The specially prepared surface of the latter dissolves, and upon being applied to the inner tube becomes amalgamated with the rubber, thus effecting a permanent repair. The patches are made in oval, oblong, rectangular, and square patterns of various sizes, and appear to be meeting with great popularity among motorists generally. The firm also showed their "Patchquick Fix" used in conjunction with these patches.

The Donisthorpe Petrol Meter.

Newcomers to the Exhibition were the DONISTHORPE PATENTS COMPANY, of 5, Southampton Street, Strand, London, W.C., who showed the micro-motor map and the petrol meter which bears their name. The map is concerned with Great Britain, which is divided into fourteen sections, each about the size of an ordinary lantern slide. By means of a magnifying-glass these are enlarged to a scale sufficiently extensive to show the roads and turnings of the country. The chief novelty here, however, was the Donisthorpe petrol meter, which provides a check upon the consumption of petrol in a similar way to that in which the speedometer registers the speed of the car. The value of such a meter is obvious, and not only should it indicate the state of the tank, but by registering the consumption should enable the owners of a car to become acquainted with its unauthorised use. That is precisely what is done by the device shown. Within the tank is placed an ordinary pawl and ratchet movement, connected by a rod with the float, which secures an indication on the gauge of the state of the tank. A second dial is provided upon which any quantity up to 100 or 1,000 gallons can be registered.

The Rapid Cars.

Another Italian car of high grade construction was the "Rapid," exhibited by the ITALIAN "RAPID" MOTOR COMPANY, LTD., who had on view examples of the 18-h.p. and 30-h.p. models. Fig. 43 gives a view of the 30-h.p. landaulet, with body by Messrs. Locatti and Toretta, of Turin, a facsimile of one supplied to Queen Margherita of Italy. As regards the details of the chassis, it may be mentioned that the four cylinders of the engine are separately cast, and have the valves located on opposite sides. The bore and stroke of the 18-h.p. motor is 90 mm. bore by 120 mm. stroke, while the dimensions of the 30-h.p. are 110 mm. by 120 mm. The ignition is by a high-tension magneto gear driven off the half-time shaft, and so fitted that it can be readily detached. The pump is also gear driven, while a current of air is drawn through the honeycomb radiator by the flywheel, the arms of which are formed to act as a fan. The carburettor is provided with an automatic valve, working in accordance with the speed and suction of the motor, allowing an instantaneous and automatic adjustment of the quantity and quality of the gas. In connection with the lubrication, provision is made in the base-chamber for readily drawing off the oil, and also for ascertaining that it is at the proper level. The clutch is of the multiple disc type, and the four-speed gear-box is controlled by a "gate" lever. On the top speed the drive is direct, all the gear wheels being out of mesh. The final drive is by cardan shaft and bevel gear to a live axle, the design of which has been very carefully thought out. It is pro-

Fig. 43.—The "Rapid" 30-30-h.p. Landaulet.

vided with a large differential gear and ball bearings; it has only the driving effort to withstand, the weight of the car being carried on the axle casing. The propeller shaft has universal joints of special design at each end. At this stand was also to be seen the "Rapid" 50-70-h.p. car which competed in the Coppa Florio race in Italy last year, and also won the flying kilometre contest at Padua.

"Smok-ett" Clothing.

"Smok-ett" has become identified with Messrs. HOARE AND SONS, whose attention to the requirements of motorists in the way of raiment is known to all Exhibition visitors. They showed their new rain coat, which is absolutely weatherproof although without rubber. The "Rex" and "Pioneer" all-wool motor coats were on view, and there was an extensive range of liveries for chauffeurs. The motor coats are all made with detachable leather lining.

The Bowen Cars.

A new firm in the automobile world, but one which has long been established as engineers and metal founders, is Messrs. BOWEN AND CO., of 6, Mount Pleasant, Gray's Inn Road, London, W.C.

In taking up the construction of motor-cars, which, we may mention, are entirely built at their works, the chief aim has been to produce a reliable vehicle, and, with that object in view, they have given every attention to simplicity in design and accessibility of the working parts, and, at the same time, the best material and highest class workmanship have been incorporated in the manufacture.

Fig. 44.—The Bowen 8-10-h.p. Commercial Travellers' Brougham.

For the present the firm are confining their attention to one size of chassis—8-10-h.p. 2-cylinder—which can be provided with either a two or four-seated body, or fitted up as a commercial traveller's brougham, or as a light delivery van.

The main frame is of ash, a subsidiary one of channel steel carrying the engine and gear-box. The engine, which is rated at 8-10-h.p., has two separately cast cylinders, 85 mm. bore by 115 mm. stroke, with the valves operated off a single cam shaft. The valve tappets are provided with a neat and simple form of adjustment, and to render them silent in operation the tappet heads are fitted with fibre washers. Ignition is by accumulator and coil, although provision is made so that a magneto can easily be fitted if desired. The water circulation is on the thermosyphon system, large-diameter pipes being used in conjunction with a framed ribbed tube radiator. The transmission is through a leather-faced cone clutch, three-speed gear-box, cardan shaft, and bevel gear to a live axle. The gear-box, the shafts of which run on ball bearings, gives a direct drive on the top speed, and is provided with three-point suspension. The back axle is of strong design, and is provided with ball bearings; the road wheels are mounted on the axle casing, so that the live axle has only the driving effort to withstand. The differential gear is of the plain pinion type. We give an illustration in Fig. 44 of the Bowen commercial traveller's vehicle, which should meet the requirements of a large number of firms as affording a means of covering a large area at a minimum of cost. The car is capable of attaining a speed of thirty miles per hour, and the petrol consumption is very low. The same chassis fitted with a delivery van body for loads of from 10 cwt. to 15 cwt. will also be found a serviceable vehicle.

The "Gordon" Hood.

The GORDON CARRIAGE WORKS, of 47, Harders Road, Peckham, London, S.E., showed their specialities in hoods, wind-screens, luggage-carriers, &c. These have been previously illustrated and described in our columns, and it will now suffice to say that the folding wind-screen has considerable merits. The upper portion turns upon a disc, allowing it to be adjusted to various angles. Full protection is afforded in a simple and secure manner. The Gordon Cape cart hood is a very rigid contrivance, in which a steel rod fixed to the frame of the car plays an important part. This can be easily detached to allow the hood to be folded back. These specialities of the Gordon Carriage Works are characterised by good workmanship and finish, as well as by the ingenuity shown in their design. A selection of rugs, foot-warmers, and other desirable accessories for the car in our uncertain climate was also on view.

The Simplex Shock Absorber.

In Fig. 45 we illustrate a sectional view of the Simplex shock absorber, exhibited by the SIMPLEX SHOCK ABSORBER SYNDICATE, LTD., of Eldon Street House, Eldon Street, London, E.C. This is a pneumatic spring cushion placed between the spring and the axle of the car, and enables solid tyres to be run, giving the same ease and comfort as a pneumatic tyre. The device consists of a metal case formed in two parts, the bottom portion, which is attached to the axle, sliding freely in the upper part, which is affixed to the spring. A pneumatic cushion between the two parts has a pressure of 10—15 lbs., according to the weight of the car. Resting on four springs, the body of the car is said

Fig. 45.—Sectional View of Simplex Shock Absorber.

to be literally "floating on air," and the impact with projections, &c., on the road is absorbed before reaching the springs. A year ago we illustrated the Simplex shock absorber in position, and regarded the invention as one worthy of attention—a view that experience has justified.

The Adams Eight-cylinder Engine.

One of the great attractions of the Show from an engineering point of view was the eight-cylinder petrol engine exhibited by Mr. W. L. ADAMS, of the Redbridge Motor Works, near Southampton. The motor, which has been designed and constructed by Mr. Adams, contains a number of interesting features. It will be seen from Fig. 46, that the cylinders are located at an angle of 45 deg. to the vertical. The cylinders, which are made of a special close-grained cast iron, are cast without the main water jacket, and are provided with seamless copper tube water jackets, 6 in. inside diameter, with three spun expansion ribs. These tubes are forced on over the flanges top and bottom, and held in position by steel rings shrunk on. The water inlet and outlet are of phosphor bronze of large area, with ball corners to reduce friction; the water enters the top of each cylinder, follows a course right down one half, round the scavenger or auxiliary exhaust chamber, and up the other half. The inlet and exhaust valves are located directly in the cylinder heads, means being provided to prevent any of the valves, should they happen to break, from falling in the cylinder. The combustion chamber is machined all over, enabling a very high compression to be used, with consequent higher efficiency, without fear of premature ignition through red-hot angles and corners. The admission and main exhaust pipes are built up in sections to facilitate the removal of any of the cylinders. The crank shaft, which is of the four throw type, is of 5 per cent. nickel steel. On each end is mounted a ball bearing 5½ in. in diameter, with ¾ in. balls. The intermediate bearings are of phosphor bronze, held by bolts running right through the crank case, with steel caps. The cam shaft, which is centrally located at the top of the crank-case, runs in six-ball bearings in an oil-tight case. Only eight cams are employed, these being double-acting, mechanically working both the inlet and exhaust valves, their exceptional large diameter, 2½ in., giving easy working with but slight wear. The cams, which are hardened and securely and firmly fixed to the shaft by keys and taper pins, run in separate oil baths. The crank case is made of aluminium alloy in the form of a triangle, the lower half being so arranged that it can be removed without disturbing the crank shaft bearings. The water pump is of the gear wheel type, delivering 600 gallons per hour at normal speed; by taking out two bolts it can be removed, a

special detachable joint drive being employed. It is driven by a ball-bearing cross shaft at one end of the motor, operated by bevel gear off the cam shaft. Mounted on the opposite end of the cross shaft are two high tension distributors, two coils being used for the ignition of the eight cylinders, one for each set of four. Two small pumps are driven by an eccentric off the cam shaft at the timing gear end of the engine. One of the pumps is employed for supplying pressure on petrol tank, while the other is for the lubrication of the engine. The oil is drawn from a special receptacle in the bottom of the base chamber, pumped into a glass-domed oil distributor, from which it is forced along six feeds down the hollow holding down bolts, and then sprayed through small holes on to the cylinder walls, piston, connecting rods, and all bearings. When the oil accumulates to a predetermined height in the lower half of the base chamber it overflows and returns through three 1 in. pipes, covered with gauze, for filtering purposes to the well. One of the principal features of the engine is the auxiliary exhaust with which it is provided, and which is claimed to increase the efficiency and power of the motor. The purpose of this extra outlet for the burnt gases is twofold; first, it does away with the power absorbed in lifting an exhaust valve of large area against a high pressure in the cylinder; and, secondly, it prevents any overheating of the combustion end of the motor. When the piston in each cylinder has completed all but ⅛ in. of its stroke, after the mixture is fired, three groups of small holes drilled through the inner wall of the cylinder are uncovered. The exhaust gases rush through these holes into an annular water-jacketed passage, where their pressure is greatly reduced. During the usual exhaust stroke the small remaining residue of the products of combustion pass out through the exhaust valve in the usual way. Another point about the motor is that it can run in either direction; by means of a special arrangement the exhaust portion of the cam can be retarded 90 deg. and the inlet portion rendered inoperative, the inlet valves when the engine is reversed operating automatically instead of mechanically. For marine work, for which the Adams engine is specially designed, the use of a reversing gear will be rendered unnecessary. The cylinders are 4 in. bore by 4½ in. stroke, and as the engine works both at a high speed and degree of compression, Mr. Adams expects it will develop 100-h.p. There are many other points of interest, reference to which is prevented by the pressure on our space, but sufficient has been said to show that the new engine will well repay careful study. Another interesting exhibit at this stand was the Adams multiple jet carburettor. This is a very ingenious and apparently effective device,

Fig. 46.—General View of the Adams Eight-Cylinder Engine.

but one which cannot be clearly described without the aid of drawings. It may be mentioned, however, that the jet in the spraying chamber is provided with eight different-sized holes. Above them is a cap, provided with a single hole, and formed on one with a barrel valve, which regulates both the quantity of mixture allowed to pass to the engine and the air inlet. In accordance with the position of the gas throttle the jet cap uncovers one or other of the eight minute petrol outlets,

simultaneously regulating the air supply to the desired quantity. When running downhill the petrol feed can be entirely shut off, the engine then drawing in pure air, which, in addition to acting as a brake, also assists in the cooling of the engine.

The Ruthardt High-tension Magneto.

Messrs. RUTHARDT AND Co., of Stuttgart, exhibited for the first time their special design of high-tension ignition magneto. This is a very compact machine, the design differing considerably from the usual pattern, while at the same time the weight is greatly reduced.

Fig. 47.—General View of the Ruthardt High-Tension Magneto.

The magnet (Fig. 49) consists of a number of separate circular discs without pole pieces; they are provided with two eccentric recesses, in one of which the armature rotates, the other forming the poles. The form of the same makes it possible to grind the surfaces of the poles surrounding the armature, and thus to reduce to a minimum the air-gap between the armature and the magnet. This and the avoidance of pole pieces enable, it is claimed, such a good utilisation of the magnetic field to be secured that its dimensions can be made much smaller than hitherto, while, owing to the reduced gap between the armature and the magnet, the circuit of the magnetic field is nearly closed, and a practically lasting permanence of the magnet consequently obtained. The armature, which rotates on ball bearings, is a Siemens shuttle type, and has two windings, a primary and a secondary one, wound on the core with great care and well insulated. The contact-breaker (Fig. 50), which is mounted on one end of the magneto, is so designed that pinion bearings of any kind are avoided. Consequently no lubrication is necessary, and it is impossible for the platinum con-

Fig. 48.—Sectional View of Ruthardt Magneto.

tacts to become oily. The contacts are opened against the action of a spring A by means of a fibre roller, which revolves upwards on an inclined plane. (The magneto, for motor-bicycle use weighs only 4½ lbs., and that for a single or double cylinder car engine 7 lbs. The various parts are, it may be added, made on the interchangeable system.)

Nonex.

The "NONEX" SAFETY TANK SYNDICATE, LTD., of 46, Dover Street, Piccadilly, London, W., showed a simple and effective device for use

with vessels containing inflammable liquids. By the adoption of the "Nonex" explosions in cans, tanks, or other vessels to which it is fitted are rendered impossible, while should by any mischance the escaping vapour become ignited the flames are under complete control, and can be readily extinguished. The device is simple and ingenious. It consists of a gauze cylinder on the principle of the Davy lamp, combined with outlet and inlet valves. The action of the latter is to release the vapour from the petrol before any pressure can cause the vessels containing liquids to wrench, leak, or explode. They also allow for a free entrance of air taking the place of the petrol when the tanks are being emptied. This can be fitted to the ordinary tanks of motor-cars and to the usual forms of petrol cans, securing the safety of the same to a remarkable degree. At the same stand was also to be seen a patent pedal guard, which is adjustable to any car. It obstructs nothing, and affords

Fig. 49.—One of the Magnet Discs of the Ruthardt Magneto.

protection for the feet from cold, wet, and dust, providing a capital fitting for use in bad weather. At the same time aprons and rugs can be used with safety and comfort, with no fear of fouling the pedals.

Number Plates.

Often the numbers for motor-cars have to be obtained at short notice, and difficulty is experienced in getting the regulation size and description. A solution of the problem is provided in the system shown by Messrs. HOWELL BROS., of 411, St. John Street, Clerkenwell, E.C., whose enamelled iron plates can be easily put together to form any combination of letters and figures. Light and strong frames are provided, slotted so as to receive the identification marks. These are attached by screws, and give an excellent appearance. They can be easily cleaned, and the way in which the good looks of the number are retained is a merit that should appeal to those who wish their marks to be as slightly as other necessary additions to their automobiles.

The Hodgkinson Change-speed Gear.

Mr. E. A. HODGKINSON, of 8, Lancaster Gate, Hyde Park, W., exhibited a model of his change-speed gear, giving practically a direct

Fig. 50.—The Ruthardt Distributor.

drive on all four speeds, and reverse, by means of a single chain. The accompanying illustration (Fig. 51) depicts the arrangement as designed for a motor-car with cardan shaft transmission. A separate driving chain wheel E is provided for each speed, but only one driven sprocket is required. The four driving wheels, which are, of course, of different sizes, are placed side by side; they are free to move or slide laterally along the driving shaft for the purpose of bringing any particular chain wheel into correct alignment with the driven chain wheel. When chang-

ing gear the clutch is disconnected in the usual way, and at the same time a dog clutch M on the driven shaft is disengaged. By lifting up a suitable trigger, incorporated with the change-speed lever, a rocking sector I engages with the chain, and lifts the chain clear of the particular chain wheel with which it is engaging. A movement of the change-speed lever itself slides the four chain wheels along laterally, suitable notches cut in a quadrant controlling the limit of movement.

Fig. 51.—The Hodgkinson Change Speed Gear.

The trigger of the change-speed lever is then depressed, and the chain falls on to the new driving sprocket brought immediately below it. The clutch can then be engaged in the ordinary way. Change of speed can be effected instantly from any one speed to any of the others, and, moreover, the gear can be changed when the car is stationary. Two jockey wheels, J, K are fitted to automatically keep the bottom of the chain taut.

Renewable Studs.

Many efforts have been made from time to time to obviate the disadvantage of the studs in non-skidding bands being unrenovable. Of these, one of the most successful we have seen was that shown in the Gallery by Mr. C. PAYNE, C.E., of Cranbrook, Kent, who claims for

Fig. 52.—Details of Payne's Compound Eyelet and Renewable Studs for Non-skid Tyres.

The lower illustration gives a section through the eyelet, washer and stud in position. The upper drawing at the left shows the washer in position ready for being clipped round the projection D as indicated at the right.

his invention that hardened studs can be used, that in the event of a stud being lost it can be renewed in a few seconds without deflating the tyre, and that the whole of a steel-studded tread can be renewed, when the studs are worn down, in less than an hour and at the cost of a few shillings only. How he secures these points of merit is apparent from the accompanying sketch in Fig. 52. Mr. Payne forms the stud in two parts, viz., the stud proper and a socket or eyelet, which

is inserted in the band, and into which the stud is fitted, two locking washers preventing it from being twisted or moved from position. The lower sectional view represents the socket inserted in the band, the surface of the fixing washer (c) rising just level with the outer surface of the tyre. The bore of the socket is slightly conical, the smallest diameter being uppermost. The stem of the stud (b) is turned to correspond, but the opening, as will be seen by the drawing in plan, is oblong, with rounded ends, and the stud is flattened on the sides. The interior of the socket, however, is only of this shape at the orifice, the remaining portion being cylindrical. By merely putting the stud in the socket, turning it half round, and giving it a slight pull, it becomes fixed. The method of locking the stud from either twisting or becoming loose is equally simple. On the top of the socket there is a slight rebate, and on this the wedge-shape (in section) washer (c) fits by a "D" shape countersunk opening. This performs, when expanded, the double office of securing the socket firmly in the band and providing the means of locking the stud by the upturned projection (d) on its edge. The locking slotted washer (e) is also of wedge shape in section, and is formed with two lugs (f.f.). From this description it will be seen that as the slotted washer (e) is forced up under the head of the stud, the folding wedged washers (c) and (e) draw the stem of the stud tightly against the taper of eyelet and the two lugs (f.f.) on the slotted washer (e) pass by the protection (d) on the washer (c), these lugs will then close together with a pair of pliers. It is then impossible for

Fig. 53.—Sectional Views of Eland Water Circulating Pump. The upper left-hand drawing is a cross section through the line XX and the one on the right a section through AA.

the stud (b) to become loose by vibration or friction against the road, as the locking washer (e) must be forced open before it can be removed. When the head of the stud, however, becomes worn away, the washer (e) can easily be opened and withdrawn, and the broken stem of the stud removed by a pair of pliers, when a new stud and washer can be inserted in a few seconds. The washer (e) being made of specially tough brass or soft steel, can be used several times if necessary. Mr. Payne's invention has many points of advantage that should prove of considerable utility.

The Eland Rotary Water Circulating Pump.

A water circulating pump of ingenious design, and one which is well worthy of the attention of motor-car designers, is the "Eland," made by Messrs. J. J. LANE, LTD., of the Phoenix Engine Works, Old Ford Road, London, E. The feature of the pump consists mainly in the fact that the water is drawn and discharged through the hollow axes of a revolving eccentric, B (Fig. 53); this latter is divided into two chambers (C and D), connected respectively with the suction and delivery. Around the eccentric, and held in position with light wings, are three slides F; at the centre of each of these slides is hinged a wing E, loosely attached to the wall of the pump cylinder, dividing the pump into three sealed chambers; consequently the revolving of the eccentric expands and contracts these three chambers, drawing and discharging

the water from and to the respective chambers. The light rings are only required to hold the slides in position until the pump is flooded, when the water pressure maintains them in place. Apart from the fact that the pump has neither valves nor glands and minor advantages, the great improvement is the very low peripheric speed of the revolving eccentric piston. Hitherto the comparative high friction speed of the rotary pump, compared with that of the reciprocating pump, has been the condemning feature; this at last is entirely avoided, as with the "Eland" the friction speed is even less than most reciprocating pumps. The pump is made in all sizes from a capacity of 60 to 4,500 gallons per hour, the larger types being, of course, intended for industrial purposes. The 200-gallon size weighs only 5 lbs., and is adapted to run at a speed of 200 revolutions per minute. Another interesting exhibit at Messrs. Laue's stand was a portable petrol-driven fire pump, designed for use

Fig. 54.—The Summers Wind Shield.

on country estates. The plant, which is mounted on two readily-removed wheels, consists of a 6-h.p. two-cylinder petrol engine, coupled through a reducing gear to an Eland pump of the type above described, and having a capacity of 6,000 gallons per hour. The plant can be quickly run to the scene of a fire, and, by removing the wheels, set on its own firm foundation near a water supply; it weighs only 5 cwt., and can project a powerful stream of water 100 ft. high.

Summers' Wind Shield.

Last November we published a full description of the details of the safety wind shield illustrated in Fig. 54, and eulogised it as one of the simplest and most effective devices brought to our notice. That opinion was confirmed by further inspection at the Show. As will be seen from Fig. 54, both the top and bottom halves are freely adjustable at any angle. They are fixed by simply turning one fly nut. The top part can be adjusted to avoid all reflections, and when in use the goggles are rendered unnecessary. At the same stand Mr. H. R. SUMMERS showed the Salisbury speedometer mileage recorder, for which he is the agent. This is an English instrument which has successfully withstood several severe tests as to its accuracy and strength. It is simply constructed on the principle of being gear-driven by patent flexible ball chain enclosed in electric-brass steel flexible casing. The balls form practically a universal joint at each link. The drive is fixed to the speedometer with a bayonet catch, and the connection can be made in a second. All sharp bends are obviated by means of bevelled wheels. The "Salisbury" speedometer indicates the rate of speed, the maximum speed attained on any trip, and records the total mileage up to 10,000. It can be driven from either the off or near front wheel, and, although the indicating hand is perfectly steady at all speeds, it is so sensitive that the slightest change of speed is instantly shown. Mr. H. R. SUMMERS' premises are at 28, Cheapside, London, E.C.

The "Electary" Accessories.

The newcomers to the Show who made a distinctly good impression upon expert motorists included Messrs. W. AND R. JACOBS, of 39c, King William Street, London, E.C., whose "Electary" motor appliances were characterised by neatness of design and, so far as it was

possible to judge, superior workmanship. Their specialities are distinguished from others by the use of the word "Electary," and include ignition accumulators in all sizes, dry batteries, head, side and tail lamps, charging boards, voltmeters, amperemeters, sparking plugs, switches, patent terminals, &c. The firm's dry battery is made in two forms, and of stout *papier mache* cases, bound together at the sides. In their "stand-by" dry battery Messrs. W. and R. Jacobs avoid chemical action by making up the cell entirely without moisture, the necessary chemical for producing the current being placed in the cell in powder, in which condition it will remain for years without giving any current. When the cell is needed for service it is only necessary to pour a small quantity of water through the opening at the top, and any losses that take place through evaporation can be replenished in the same way. A singularly good coil shown was the "Voltoo," working on two volts, and taking only one-fifth of an ampere to produce a spark equal to a 4-volt. coil—a means to economy. The "Electary" terminal is another speciality with merits. This can be left attached to accumulators for recharging, disconnecting the wire from the terminal instead of the terminal from the battery. A neat form of garage lamp for use with accumulators was on view, and half-a-dozen good forms of switches for cars and cycles. Mention may also be made of an instrument for indicating the state of the accumulator. When the latter is fully charged the pointer indicates the fact on the dial, and gradually falls as the battery becomes exhausted. A steering pillar lamp, with universal joint, was another minor exhibit of some interest, and this reference to a really creditable display of electrical accessories may conclude with a word of praise to the firm's charging boards, designed to meet the demand for a cheap as well as an efficient board.

Turner's Detachable Rim.

Among the detachable rims considerable notice was taken of that shown by Messrs. TURNER'S AUTOMOBILE WORKS, LTD., of Heald Grove, Rusholme, Manchester. The formation of this will be seen from the illustration (Fig. 55). In this the detachable flanged rim consists of a fixed part A, a loose flange B, and a locking ring C; D represents the wood felloe. In order to fix the tyre in position the cover is first placed on the fixed rim. Then the loose flange is put into position, the springing of the split locking ring into place being all that is necessary to secure it. The pressure of the air consequent on the inflation of the tyre assists the cover to be doubly secured in position. Any existing wheel can be easily converted to the purpose of Turner's detachable flanged rim simply by removing the old rims. There is no need to cut

Fig. 55.—The Turner Detachable Rim.

down the existing wood felloe. Another advantage is that all parts are interchangeable. The tyre can be detached and attached without the aid of tools, and all risk of damaging the inner tube is obviated by seeing it in position before fixing the flange. The same makers have also a No. 2 rim, by the use of which a spare rim and tyre can be carried fully inflated and ready for fixing on any wheel of the car. This can be fitted in a minute. Yet another device of the Turner Automobile Works was a combination of these specialities in No. 3 Combination Rim. (To be concluded.)

THE OLYMPIA INDUSTRIAL MOTOR VEHICLE EXHIBITION.

The second annual exhibition of industrial motor vehicles and motor-boats held at Olympia, W., was opened on the 27th ult. and closes to-day (Saturday). While the principal firms in the trade are represented there is no striking novelty, the outstanding feature of the show being the large number of makers who are now turning out motor-cabs.

The exhibit of the Wolseley Tool and Motor Car Company, Ltd., is a varied one, including as it does an 18-h.p. single-deck 'bus, a 30-cwt. van chassis, a 10-cwt. van and a 10-h.p. cab; an illustration of the latter was given in our last issue. The engine is of the two-cylinder type, with a bore of 3½ in. and a stroke of 4½ in. Ignition is by high-tension magneto and the water circulation is arranged on the thermosiphon system. Three speeds with a direct drive on the top are provided by the gear-box. The wheel base is 8 ft. 2 in. and the lock is such that the vehicle can turn in a 20 ft. roadway. A new motor-cab is also shown by the Austin Motor Company, Ltd.; in this the motive power is supplied by a 15-h.p. four-cylinder engine, located under the driver's seat and built up with the gear-box as a single unit; the final drive is by cardan shaft and bevel gear to a live axle. Other motor-cabs on view include the 10-12-h.p. Unic, shown by Messrs. Mann and Overtons, Ltd., the 10-h.p. two-cylinder and 12-16-h.p. Stars, by the Star Engineering Company, Wolverhampton, the two and four-cylinder vehicles of Messrs. A. Darracq and Co., Ltd.; the 14-16-h.p. four-cylinder Berna, by Berna Motors, Ltd.; the 12-15-h.p.

Sturmeys Motors, Ltd.; the Alldays, by Messrs. Alldays and Onions, Ltd.; the Beeston and Coventry Humbers, by Humber, Ltd.; the 10-14-h.p. Renault, by Messrs. Renault Freres, Ltd.

Clifte Engineering, Ltd., of Portlade, show a Fric 12-16-h.p. 20 cwt. lorry, the novelty of which lies in the double friction drive, which gives any speed between zero and the maximum and does away with the use of the ordinary gear-box. A new-comer in the motor lorry section is the Darwen Automobile Agency, who show a Frazer-Miller 24-h.p. 2-2½ ton vehicle. This is an American built machine, comprising a number of novel features, principal among which is the air-cooled engine. The four cylinders are provided externally with a large number of projections and covered by light metal cowls, through which a powerful blast of air is forced by a large fan driven off the engine. Messrs. T. C. Aveling and Co., Ltd., Birmingham, show a Broom and Wade 3-4-ton lorry, fitted with a 25.6-h.p. single-cylinder engine using paraffin as fuel. Prominent on the stand of Messrs. Durham, Churchill and Co., Sheffield, is a 24-30-h.p. twenty-six-seated char-a-banc; examples of the firm's 2 and 3-ton lorries are also on view. A noteworthy exhibit of Commercial Cars, Ltd., Luton, is a 30-36-h.p. 3-4-ton brewery lorry fitted at the rear with a small jib crane operated by the engine, by means of which casks can be readily loaded and unloaded from the vehicle.

Halley's Industrial Motors, Ltd., of Yoker, Glasgow, exhibit a 2-ton van, a 20-cwt. chassis, and a 20-h.p. fire tender built for the Corporation of Clydebank. The Ryknield Motors, Ltd., have on view a polished chassis of their latest 40-50-h.p. 5-ton vehicle, as also a 22-seated single-deck 'bus and a 3-ton furniture van. A big display is made by Messrs. Dennis Bros., Ltd., Guildford, whose exhibits include

General View of the Olympia Industrial Vehicle Exhibition.

Thames, with worm drive, by the Thames Engineering Company, Ltd.; Greenwich; the 12-14-h.p. Straker-Squire, by Messrs. Straker Squire, Ltd.; the 10-h.p. De Dion, by Messrs. De Dion-Bouton, Ltd.; the 12-18-h.p. Lotus, by Sturmeys Motors, Ltd.; the Coventry and Beeston Humbers, by Humber, Ltd.; 10-14-h.p. Fiat, by Fiat Motors, Ltd.; the 12-14-h.p. West-Aster, by Messrs. West, Ltd.; the 8-9-h.p. Renault, by Messrs. Renault Freres, Ltd. Among the cars specially designed for the use of commercial travellers are the 12-h.p. Bentall, exhibited by Messrs. E. H. Bentall and Co., the Darracq, by Messrs. A. Darracq and Co., Ltd., and the 10-h.p. Austin, by the Austin Motor Company, Ltd.

The Victoria Street Garage and Showrooms Company, of 94, Victoria Street, Westminster, exhibit several of the novel 6-h.p. delivery vans illustrated on page 131 and for which they have acquired the British agency. The vehicles, which are of French construction, are known as the "Roval." The motor power is supplied by a De Dion 6-h.p. single-cylinder directly connected with the three speed and reverse gear-box mounted below the driver's seat in front of the back axle, the final drive to the rear road wheels being by side chains. The vehicles are designed to carry loads of from 10 to 12 cwt., and can attain a speed of close upon twenty miles per hour. Other light petrol motor delivery vans for loads from 7 to 20 cwt. on view include the Vulcan, shown by the London and Parisian Motor Company, Ltd., the Bentall 11-h.p. vehicle, by Messrs. E. H. Bentall and Co., Heybridge, Essex; the Unic, by Messrs. Mann and Overtons, Ltd.; the Royal Windsor by the Industrial Motor Company, Windsor; the Horley, by the Horley Motor and Engineering Company, Ltd.; the Belsize, by Belsize Motors, Ltd., Manchester; the Darracq, by Messrs. A. Darracq and Co., Ltd.; the Thames, by the Thames Engineering Company Ltd.; the Lotus, by

a 15-cwt. post office van, 2, 3, and 4-ton chassis, a 30 cwt. van for Harrod's Stores, Ltd., and a 28-h.p. 20-seated char-a-banc. All the vehicles are fitted with the Dennis worm drive, and the fact that the bulk of the machines on view are repeat orders speaks well for the satisfaction they are giving in practice. The Lacre Motor Car Company, Ltd., stage a number of the largely-used Lacre 16-h.p. vans for loads of from 24 cwt. to 2 tons, the exhibit including the first one delivered to Messrs. Shoobred and Co., which has run upwards of 40,000 miles without a stop due to mechanical causes.

Berna Motors, Limited, have a large display, including a 5-ton 35-h.p. chassis, an 18-h.p. 2½-ton lorry, and a 2½-ton laundry van. The Maudslays Motor Company, Ltd., have on view the actual 3-ton lorry which gained a gold medal in the recent trials, also a 2-ton chassis and a 30-h.p. single deck 'bus for the Midland Railway Company service between Desborough and Rothwell. A new 3-4-ton 30-40-h.p. lorry is shown by Messrs. A. R. Atkey and Company, Ltd. The transmission is on novel lines, the power being conveyed from the cross-shaft at the rear of the gear-box by a compound roller chain to an intermediary shaft above the axle, the final drive being by pinions gearing with internally-toothed rings bolted to the rear road wheels. Messrs. J. I. Thornycroft and Company, Ltd., show a 30-h.p. twenty-nine passenger char-a-banc, a 30-h.p. single-deck 'bus for the L. and S. W. Railway Company, for service between Exeter and Chagford, a 30 cwt. van and a 3½-ton van, the latter being designed to use paraffin as fuel.

The exhibits of Argylls Motors, Ltd., and Argylls London, Ltd., include a 12-h.p. four-seated cab, 15 cwt., 20 cwt., and 40 cwt. vans and lorries, and a 20-h.p. fourteen-seated single-deck 'bus with worm drive. A new-comer in the heavy petrol motor lorry section is the Societa

Cantieri Gallinari, of Leghorn, Italy, who show a 40-h.p. 5-6-ton chassis. The vehicle is of strong construction, a feature being the transmission; the drive from the gear-box is by a cardan shaft which operates by bevel gear, a short differential shaft in front of the rear one-piece axle, the connection between the two being by means of two pairs of spur wheels. Leyland Motors, Ltd., as the old Lancashire Steam Motor Company is now known, exhibit a 35-h.p. double-deck 'bus and a 2 and 3 ton lorry chassis. Milnes-Daimler, Ltd., stage a 28-h.p. 'bus for the G.W. Railway Company, a 2-ton van, a tip wagon and a 35-h.p. 5-ton chassis, the latter comprising a number of new features. Heavy petrol lorries for loads of from 2 to 3 tons are also staged by Messrs. J. and E. Hall, Ltd., Dartford Messrs. J. E. Hutton, Ltd. (Berliet); the Thames by the Thames Engineering Works, Ltd.; the 3-ton Bussing by Messrs. Straker and Squire, Ltd.; the Armstrong-Whitworth by Sir W. G. Armstrong, Whitworth and Co., Ltd.; the Arrol-Johnston by the New Arrol-Johnston Car Company, Ltd.; the 4-ton Fiat vehicles by Fiat Motors, Ltd.; and the 5-6-ton 36-45-h.p. lorry by the Gaggenau Motor Vehicles Company. Mero, Ltd., Sheffield, have on view a Straker-Squire 'bus fitted with their patent "Mero" change-speed gear, which has already been described in these pages. Messrs. Barford and Perkins, Peterborough, are present with two examples of their water-ballast motor rollers, the engines of which can be adapted to use petrol or paraffin.

Petrol-electric motor-buses are shown by the Daimler Motor Company Ltd.—their vehicle being on the Automixte system—Messrs. Greenwood and Batley, Ltd., Leeds, and Messrs. J. and E. Hall, Ltd., Dartford. The feature of the Greenwood and Batley vehicle is that two electric motors are used, each of these driving one-half of the rear live axle through worm gear. A similar drive is adopted in the Hallford chassis of Messrs. Hall; in this case, however, the two motors are located outside the frame. The Electrical Vehicle Company, Ltd., have on view an Electrobuss similar to those seen running in London, as also a number of vans and lorries, reference to which will be made in our next issue.

In addition to a 40-h.p. petrol motor twenty-two-seated char-a-banc, the Critchley-Norris Motor Company, Bamber Bridge, show for the first time a 30-40-h.p. 2-3-ton steam motor vehicle on the Kitchen system; the engine and boiler are located in the fore part of the frame, the transmission being by a cardan shaft to the differential shaft and thence by side chains. The exhibitors of steam lorries include Messrs. Wallis and Stevens, Ltd., of Basingstoke, the St. Pancras Ironwork Company, Ltd., London, N.W.; Mann's Patent Steam Cart and Wagon Company, Leeds, Messrs. D. Stewart and Company, Ltd., Glasgow, Messrs. Straker and Squire, Ltd., Messrs. Alley and MacLellan, Ltd., Glasgow, Leyland Motors, Ltd., Leyland, and Fodens, Ltd., Sandbach. The last-named firm exhibit for the first time in London their new 3-ton wagon designed to run on solid rubber tyres. Steam tractors are shown by Messrs. Chas. Burrell and Sons, Ltd., Thetford, Messrs. Clayton and Shuttlesworth, Ltd., Lincoln; Messrs. Wm. Foster and Co., Ltd., Lincoln; Messrs. Wallis and Stevens, Ltd., Basingstoke; Messrs. R. Garrett and Sons, Ltd., Leiston; Messrs. W. Tasker and Sons, Andover; and Messrs. John Fowler and Co., Ltd., Leeds.

Among the interesting exhibits in the motor-boat section is the "Clift" four-cylinder paraffin engine, which has a patent compression release device to enable the valves, sparking plugs, carburettor, &c., to be removed whilst running; also for inspecting the ignition spark in

ing compressed-air chambers hermetically sealed, producing an unpuncturable inner tube, or providing an admirable cushioning material for upholstering cars.

At the stand of the Polack Tyre Company is a selection of their solid rubber tyres, and also a new idea to withstand skidding, introduced by Mr. W. Coleman. His invention, which is being marketed by the Polack Company, consists in the combination of hard and soft rubber, the latter being rather deeper than the former, so that an even surface is maintained on the road. Yet when a skidding tendency

Fig. 2.—Plan of Chassis of Royal Delivery Van.

develops it is thwarted by the opposing natures of the two rubbers. For heavy lorries a triple tyre is being brought out, in which the soft rubber forms the central tyre, the two outer ones being of hard rubber, the three forming a useful combination. For motor-buses a dual series of hard and soft rubber blocks form the surface on the road, these being opposite to grooves, so that slipping is prevented. The same idea of the utilisation of hard and soft rubber is being developed in connection with pneumatic tyres for cars, studs of hard and soft rubber alternating on the outside tread in the same way as the ordinary metal studs. The rubber studs are inserted half-way through the tread, and securely fixed beyond possibility of loosening.

A new flexible hub, forming a resilient wheel, and designed for use in conjunction with all kinds of tyres, is exhibited by Messrs. Smith's Flexible Hub, Ltd., of 20, Copthall Avenue, London, E.C. When used as an auxiliary to the solid tyre, it should minimise the wear and tear of the machinery by the resiliency it affords in carrying weight and in the drive. The main feature is that a flexible drive is transmitted through the agency of rubber-covered spindles or distance pieces, which are located in chambers formed in the rigid body of the wheel, and connecting together side plates which cover the ends of the hub. The object is to provide a hub of comparatively simple construction wherein the shocks due to the vehicles passing over inequalities of the road are more readily absorbed by the flexible cushions, so that the "give and return" of the cushions is unaccompanied by any jar, and a positive, although at the same time flexible, drive is obtained. The invention is not brought to the Exhibition in an untried state, for these hubs have been tried on the public service cars of the Sutherland Motor Traffic Company, Ltd., with success, on some motor hansom cabs in London, and also in private use. The "Hindley" disc wheel, and other wheels for commercial vehicles, are demonstrated by Messrs. G. Scammell and Nephew. As usual, Messrs. Smith, Parfrey and Co., Ltd., have a very attractive exhibit of their forgings for motor vehicles. Artillery motor omnibus wheels and a differential back axle for a 30-cwt. delivery van are also to be seen under their auspices.

In the tyre section the "De Nevers" grooved solid tyres are shown by Messrs. J. Liversidge and Son, Ltd., who are also introducing the "Scott" non-skid treads; while a complete range of the Sirdar, Dunlop, "Peter Union," Gaulois, Bergougnan, and the K.T. are on view. The Shrewsbury and Challiner Tyre Company, Ltd., exhibit the "Giant" wheels and Challiner's detachable rim. The "Ajax" detachable rim is on the stand of the Midland Rubber Company, Ltd., who also exhibit samples of tyres repaired at their works in Ryland Street, Birmingham. A good selection of solid tyres and artillery wheels is presented by Messrs. J. W. and T. Connolly, Ltd.

Well-known lubricants are shown by the Stern-Sonneborn Oil Company, Ltd., whose lubricators suitable for motor-cars are also on view. A representative collection of lubricating oils and greases for use with commercial motor-vehicles is made by Messrs. Engelbert and Co. The Vacuum Oil Company, Ltd., take advantage of the occasion to obtain attention to their fluid and semi-solid lubricants for motor-cars and boats. Another prominent exhibitor is Price's Patent Candle Company, Ltd., whose "Motorine," "Oleogene," "Cirogene," "Manular," &c., are generally known to our readers. Several good grades of oil are also to be seen in the space devoted to the specialties of Messrs. W. H. Willcox and Co., Ltd., many of whose oils have been specially refined for use in motor-buses, wagons, tractors, &c. They also have a range of engineering tools and appliances, including the Penberthy injectors, lamps for lorries, and the usual motor engineers' requisites.

(To be concluded.)

Fig. 1.—The Royal Delivery Van.

the cylinder. A patent pump gear is fitted to enable either of the two water pumps to be removed whilst the engine is running on the other pump. Williamson's Patents Company, of Gorleston, also exhibit a novel internal combustion engine with oscillating cylinder.

In connection with tyres, mention may be made of the "Elastes" filling, which has become well known among motorists, and also the "Elastes" moveable-flange rim, shown in operation at the stand of the Elastes Company, Ltd. A new form of resilient inner tube is on the stand of the Pneumatic Syndicate, Ltd. The essential feature of this system is a spongy material impregnated with mutually-support-

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Larrad Syndicate are in error. I have not at last admitted that there is something in synchronisation. I never disputed that it was not desirable to have all the valves synchronised. What I disputed and still dispute is that one particular setting is correct for all engines. I would draw the Larrad Syndicate's attention to the remarks by that eminently practical motor engineer, Mr. T. Blackwood Murray, whose experience is worth going by. They now doubt the accuracy of a protractor as compared with their device. I am afraid I must once more differ; a protractor, like many other delicate instruments, can be used rightly and wrongly, but I do contend that a flywheel can be accurately marked out with a protractor by anyone acquainted with the use of the instrument.

Will the Larrad Syndicate explain why their setting is superior in the case of automatic valves? I keep on wondering what happens to the exhaust gases that must remain in, due to (1) back pressure on the exhaust, (2) the downward movement of the piston before the exhaust is shut. I do not wish the Larrad Syndicate to misunderstand me. I am most interested in the matter, and I consider they are most enterprising people in introducing the "one setting" theory. I hope that this discussion with their views and those of other people will continue, as I am positive the last word has not been said about valve position.—Yours truly,

INTERESTED ENQUIRER.

THE 2,000 MILES RELIABILITY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the large amount of interest which has been shown, and the discussion which has taken place respecting the treatment of light cars in the proposed 2,000 mile trials organised by the R.A.C.,

The Novel Racing Car designed by M. Henri Farman.

M. Farman considers that the vehicle, which is an outcome of his aeroplane experiments, would only weigh about 8 cwt., and fitted with a 50-h.p. engine could attain a speed of over 90 miles per hour. As will be seen, the design provides for the propulsion of the car by means of a large fan at the rear driven by the engine through the medium of a long propeller shaft.

[La Vie au Grand Air.]

we beg to give you some particulars which we think will interest the manufacturers of light cars. For various reasons, of which financial consideration was one, we have decided not to enter any Ford cars in the 2,000 mile trials. We have not yet come to a decision with reference to the Scottish trials, but we intend to place a team of four cars in the Irish trials.

The consideration of finance is a very considerable one, and was dealt with very completely by Mr. Sturmev in his recent criticisms of the R.A.C. trials. It has been urged against the Irish trials that there is considerable inconvenience, loss of time, and expense entailed upon British manufacturers in taking cars to Ireland. This is undoubtedly so, but there are many compensations in favour of the Irish trials. For example, the entrance fee for the 2,000 mile trials for our 15-h.p. Ford car is £55, the entrance fee in the Irish trials is 6 gs.; in addition to the entrance fees in the 2,000 mile trials competitors have to provide observers; that is to say, they must hire an observer, pay him for his time, and they must pay his expenses and buy an "official" watch.

The following figures give a comparison of what the cost is for a team of four cars in the Irish and in the 2,000 miles trials respectively. No account has been taken of wages, nor has any debit been made against the R.A.C. trials in respect of their longer duration and the con-

sequent increased cost for wages and increased cost for car depreciation, wear and tear, petrol and lubricating oil consumption, tyre renewals, &c. The figures are merely out-of-pockets, and whereas we have allowed nine days for getting cars to Ireland and bringing them back to London, and have charged up expenses accordingly, we have assumed that inasmuch as the 2,000 mile trials commence from and finish in London, there will be not more than two days lost in taking cars to the starting place and bringing them home after the expiration of the trials.

| | Irish. £ s. d. | R.A.C. £ s. d. |
|---|-------------------|-------------------|
| Entrance fees. Four cars ... | 25 4 0 | 220 0 0 |
| Men's expenses, five men at £1 per day— | | |
| R.A.C. trials, twenty-six days ... | | 130 0 0 |
| Irish trials, fifteen days ... | 75 0 0 | |
| Return freight, Holyhead to Dublin ... | 14 0 0 | |
| Men's fares on boat (ditto) ... | 4 0 0 | |
| Fees and expenses of observers— | | |
| Twenty days at 30s. per day ... | | 30 0 0 |
| Six days at 15s. per day ... | | 4 10 0 |
| Watches for observers... .. | | 8 0 0 |
| | 118 4 0 | 392 10 0 |

It will therefore be seen that exclusive of all the additional cost for wages, petrol, &c., as above pointed out, it would cost us more than two-and-a-half times as much to put a team of four Ford cars through the 2,000 mile trials, as it will to put the same team through the Irish trials. The serious question which a manufacturer or concessionaire has to consider is, whether the 2,000 mile trials are going to be worth the proportionate additional cost. There is no doubt that the R.A.C. trials are being held at a more inconvenient time of the year, and will take up a considerable amount more time. The Irish trials will cover a course of 800 and some odd miles, including speed tests and hill climbs. We submit that the car which goes through the Irish trials will have proved itself to be a good car, to the satisfaction of the average purchaser, just as much as a car which goes through the R.A.C. trials.

At the time of writing there seems to be no doubt that there will be even a bigger competition, that is to say, more entrants in the Irish trials than there will be in the 2,000 mile trials; there will be a very great deal of interest shown in these trials, but it is, perhaps, hardly to be expected that they will secure so much publicity as the R.A.C. trials. There is, however, very little doubt that unsuccessful competitors in reliability trials do not want publicity, whereas the successful competitors make nine-tenths of their own publicity.

In our opinion the Irish trials are, from a small car manufacturer's point of view, infinitely preferable, being for an adequate distance, occupying a reasonable time, and, being conducted under rules and regulations proper to such reliability trials, they are not experimental, and, what manufacturers will appreciate, are not an alleged philanthropic effort, notwithstanding that entrance fees are less than one-eighth of the amount of the entrance fees of the R.A.C. trials; furthermore, one experiences in Ireland what only competitors who have gone through several trials and been subjected to various methods of treatment properly appreciate, viz., a fair-minded, always courteous, and absolutely gentlemanly and sportsmanlike treatment from all the officials of the Irish Automobile Club.—Yours truly,

PERRY, THORNTON AND SCHREIBER, LTD.

COURTESY ON THE ROAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One often hears of the apparent inhumanity of cyclists (and others) who pass people in difficulties on the road without offering to help them in any way. Can one altogether wonder at this after the following incident.

On Saturday night last I was cycling on London road just under a mile out of Basingstoke town, when another cyclist (A.) passed me. I noticed another cyclist (B.) coming in the opposite direction at a very fast pace, and before A. got anywhere near him, B. fell from his machine, knocking himself about considerably. A., after riding past him, dismounted, walked back to B. and helped him on his feet again, when B., with a lot of "bluff," asked for our names and addresses and accused A. of colliding with his cycle which caused him to fall, and he made himself so objectionable that we had to send for the police. I might state *en passant* that I know nothing whatever about A., never having, to my knowledge, seen him before. It would be very interesting to know the position of a cyclist (or motorist) placed in the same circumstances as A.

if there had been no witness present, and B. sued A. for any damage done to either himself or his machine.

Thanking you in anticipation for the insertion of this in your paper, and enclosing my name and address.—Yours truly,

CYCLIST.

THE DUST QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—Our experience, based on numerous experiments in this direction, is, that the larger the area of resistance of a fast moving car, the greater the air displacement, or partial vacuum which seems to be created behind the car, and so it follows, more dust is raised. And in so far as a large folded buggy hood goes to increase this resistance, it must increase the dust raised. It all depends on whether the hood when folded back adds to the area of the car's resistance as seen from the front, or not.

Whether it overhangs the road behind or not does not affect it one way or the other, in our opinion. Our own screen, which does this, but does not materially add to the area of the car, does not cause the car to raise any more dust than it does without it. We think this can easily be proved by a simple experiment. Take a sheet of cardboard, and holding it parallel with, and face downwards to a dusty floor or road, move it rapidly backwards and forwards, and no dust would be raised, although perhaps only a few inches away.—Yours truly,

W. E. WRIGHT.

(The Motor Dust Screen Company.)

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—With reference to your remarks on the report of the R.A.C. dust trials we have ourselves noticed that the dust is increased with the use of some Cape hoods.

Our experience in this matter is, that it depends chiefly upon the way the hood is set on the car; if, as in some cases, the hood is only slightly raised at the back, we find the dust is carried some distance and then shot off at either side of the car.

When the hood is raised high at the back it has the effect of throwing the dust away from the car, thereby causing it to settle more quickly.—Yours truly,

A. WESTON.

(T. R. Bye and Co.)

WILL THE BELT DRIVE BE REVIVED?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—As a motorist of moderate days dating from the time of the early 3½-h.p. Benz cars, I was interested in the announcement in the *M.C.J.* last week that the Brouhot Company of France was bringing out a new belt-driven car. For small-powered vehicles the belt drive enables a simple type of automobile to be produced and one that does not need an engineer to keep in order. French makers have so long pinned their faith to the gear drive that the new departure of the concern above mentioned seems to suggest that we are about to see a revival of interest in belt-driven vehicles, which, from the point of view of simplicity, are certainly worthy of attention.—Yours truly,

DORSETONIAN.

ROAD SIGNS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—It would be an advantage to many readers if you could give illustrations with explanations of the meanings of the various road signals now in use. I was driving with a friend some time ago when we passed several of which neither of us understood the meaning, so I think the information would be welcome to many of your readers besides—Yours truly,

NOVICE.

[The road signals recognised by the Local Government Board are as follows:—

For 10 mile or lower limit of speed.

For Prohibition of Motor Cars.

For Caution at dangerous places, etc.

All other notices to be on diamond shaped boards.

THE ENDORSEMENT OF LICENSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—Your correspondent "A. D. K." has my entire sympathy. I also have experienced some of the troubles which he alludes to, and although in all probability the endorsement is strictly within the letter of the law, I, too, cannot imagine that it is in accordance with common sense. It is a remarkable thing to me that any body of men can sit together for a considerable time and eventually fine another man the paltry sum of one shilling for an offence which really amounts to nothing, and is purely technical. As for the costs of such an affair, it is, in my opinion, highway robbery by Act of Parliament. There seems to be a great deal too much prejudice against any unfortunate individual who happens to be driving a motor-car. My own license is endorsed in three places, and these by the merest accidents.

In all three cases it has happened that I have been working in my shirt-sleeves on a car, and, probably enthusiastic about my work, I have jumped on the car and driven it to see the result.

A local constable naturally and quickly concludes that that man has not got his license in his pocket, because as a matter of fact he has not even got the pocket on him. He took it off to keep it clean while he did the work, but it cost him considerably more than a new coat would have done. I think that so far as accidents go the license, after all, is of very little avail, and what I do emphatically say is this: If a man has an accident, ask for his license. If he has not got it on him, what the police should do is to find out whether he has a license at all. If he has not, then let them act; but why fine a poor man and bias the opinions of those who are for the time being against him, simply because he did not happen to have the license on his person?

One of the Benz Cars for the A.C.F. Grand Prix Race.

I think to some extent the same theory applies to the speed limit. Why not let a man drive at his own discretion, then when he has an accident or a collision pile it on to him, not on to the poor man who is anxious to keep his place, and is probably driving half a mile an hour faster than he should have been? One thing more—why is the license always spelt with two c's when it should not be?—Yours truly,

HERBERT J. CHAPMAN.

THE SECOND-HAND CAR PROBLEM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—One of the most serious problems at present facing those interested in the motor industry in this country is the disposal of high-powered second-hand cars. At nearly every depot that one visits a number of such cars are on hand, purchasers for which appear to be coming scarcer every day. The rich car-owner, when he desires a change of automobiles, looks disdainfully on second-hand machines, and orders a new one from the factory. The only probable purchasers of the second-handers are would-be motorists of moderate means, who find, some from bitter experience, that it is not the first cost of these vehicles that is the trouble, but the upkeep of the same, the tyre bill in particular working out very heavy. Nor is the outlook for the disposal of powerful second-hand cars improved by the taxation proposals at present in the air, be they based on weight or horse power. Altogether the problem is a difficult one, and he who can find a satisfactory solution will deserve well of the trade.—Yours truly,

A PROVINCIAL TRADER.

RACES AT BROOKLANDS.—Mr. S. F. Edge writes:—"No doubt you have studied the list of races published by the Brooklands Racing Committee for their race meeting on Easter Saturday and Monday. In the autumn of last year it was decided that at every meeting they would have standard class races, to wit, 26-h.p., 40-h.p., 60-h.p. and 90-h.p. These sizes were decided upon at a meeting called to discuss this very question, and which was attended both by prominent men in motor racing circles as well as by representatives of the leading motor firms, and I certainly understood that it was the intention of the latter to build cars to race in these classes. Acting on this assumption, the six-cylinder Napier cars for the 1908 season were made in accordance with dimensions specified at this meeting, and I now see with great surprise that the bulk of the races set out in the Brooklands schedule admit of all kinds of odd sizes of cars, a state of affairs which practically bars the six-cylinder Napiers, as, of course, it is impossible at such short notice to make cars conforming to these new sizes. This being so, it must be clearly understood that there will be a great number of races at Brooklands in which the Napier will be unable to take part. For standard sizes, of course, there will always be a Napier competing."

MESSRS. LEO RIPAULT AND CO., of 64A, Poland Street, London W., have issued a new catalogue of the Oleo specialities, for which they are sole British agents. These include plugs, voltmeters, amperemeters, terminals and a hundred other accessories.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

MR. C. D. ROSE, M.P., has been re-elected chairman for the ensuing year. On the motion of the Hon. Arthur Stanley, C.V.O., M.P., it was resolved "that the best thanks of the Committee and of the Club are due to Mr. C. D. Rose, M.P., for his strenuous work in upholding the best traditions of the club during his year of office." Mr. W. Worby Beaumont, Professor C. V. Boys, F.R.S., and Mr. Chas. Hardy have been elected vice-chairmen. Mr. Paris E. Singer is re-elected honorary treasurer and Mr. W. Worby Beaumont honorary consulting engineer. The Hon. Arthur Stanley, C.V.O., M.P., and Colonel H. C. L. Holden, R.A., F.R.S., have also been re-elected honorary members of all committees.

MOTOR UNION.

UNDER the auspices of the Motor Union a national conference of automobilists to consider the questions of Parliamentary policy was held at the Hotel Cecil, London, on the 25th ult.

Mr. W. Joynson-Hicks, chairman of the Union, presided, and said that after last month's deputation to the Chancellor of the Exchequer the Motor Union decided to communicate with the local authorities asking their views as to the possibilities of increased taxation and to prepare a petition to Parliament, from all users of motor-cars. That conference was called in order to assure themselves that they had the support and confidence of motorists generally. It was perfectly clear that if they antagonised the local authorities they would be in for serious trouble with the Legislature, and he was glad to say that upwards of 300 local authorities had responded to their request to pass a resolution approving the principle that the money raised from the taxation of motors and other vehicles should be paid out in grants towards ex-

and other vehicles should be paid over to and administered by a Central Department as a grant in aid for highway purposes."

This was seconded by Mr. P. Armitage and agreed to.

The Chairman proposed: "That, in view of the difficulty of arriving at an equitable basis of taxation for motor vehicles, this conference is of opinion that before any change is made in the existing basis the matter should be referred to a Departmental Committee for consideration and report." The object, he said, was to settle once for all whether taxation should be by weight or by horse-power.

This was seconded by Mr. J. D. Siddeley and carried.

Mr. Joynson-Hicks subsequently presided over the annual meeting of the Motor Union. The report showed that at the end of 1907 there were 101 clubs in membership, the individual numbers being 4,748 as compared with 3,295 in the previous year. There were 149 life members. The total income amounted to £8,282.

Mr. W. Joynson-Hicks moved the adoption of the report.

This was seconded by Mr. C. H. Dodd, who said the Union would continue to work for the provincial motorist and for the owner of the car of moderate horse-power. Great developments were anticipated from the newly-formed Touring Department.

The report having been adopted, Mr. W. Ballin Hinde moved the acceptance of the accounts. The financial position had never been a cause of anxiety. The Union was in a sound state and had a considerable reserve fund. Mr. C. McWhirter seconded, and mentioned that the reserve for an emergency was practically £9,950. The accounts were then accepted unanimously.

Some alterations in the rules made necessary by the altered state of affairs were then sanctioned. Messrs. W. Joynson-Hicks, W. Ballin Hinde, and W. Bourke were elected trustees, and the meeting concluded with the adoption of the resolutions arrived at by the conference held earlier in the day.

The Argyll 14-16-h.p. Two-Seated Car recently supplied to Mrs. Hunter, of Thurston, North Berwick.

penditure on the roads. The petition to the Government on the subject had already been signed by over 20,000 people, and that number would doubtlessly be increased. He moved: "That in the opinion of this conference no sufficient reasons can be shown on general principles for any additional taxation of motor vehicles."

Earl Russell, in seconding the resolution, declared that there was no justification for an increased tax on motor vehicles. If the basis of taxation was that of luxury, that applied to other things besides motor-cars. The resolution was carried.

Lord Montagu of Beaulieu moved: "That this representative conference of automobilists is of opinion that additional taxation of motor vehicles, if sanctioned and allocated to the general purposes of revenue instead of to the purpose of road improvement, would tend to retard the development of improved methods of transit, and should be strongly opposed as contrary to the public interest." They might take it as a fact, he remarked, that Mr. Asquith intended to increase the taxes on motors. A tax on locomotion was *per se* a bad thing, but there was no doubt whatever that the expense of maintaining main roads had gone up very greatly owing not only to motor-cars, but to the general increase of traffic all over the country. Motorists had the support of County Councils and local authorities in demanding that the extra money should be devoted towards road mending. The motion was seconded and carried.

Mr. C. H. Dodd, vice-chairman of the Motor Union, proposed: "That this conference strongly supports the recommendation of the Royal Commission on Local Taxation that financial assistance should be given by the State to local authorities for the purpose of improving the roads, and is of opinion that the revenue derived from taxation of motor

SOCIETY OF AUTOMOBILE MECHANIC DRIVERS.

THE third annual dinner of this society was held at the Criterion Restaurant, on the 28th ult., Lord Montagu of Beaulieu occupying the chair. Among the 200 persons present were Sir Nevill Gunter, president of the society, Sir John H. A. Macdonald, Colonel W. J. Bosworth, Messrs. W. Rees Jeffreys, Stenson Cooke, A. C. Hills, and G. T. Clarke.

After the loyal toasts, Lord Montagu proposed "The Society," observing that the gathering was a practical demonstration of the sympathy that the leading automobile bodies had with the aims of the society, which should become beneficial to the public at large. On the road everything depended on the skilful and considerate handling of the car, hence his hearers had nearly the whole of the legislative future of the movement in their hands. Let them show the public that the drivers of motor-cars considered themselves as one class of road user only, and were considerate accordingly. As being collectively practically the controllers of motor traffic it was well that they should band themselves together. The objects for which they were established were such that no sensible person could take exception to them. They were setting up their own benefits, thereby being more than self-supporting, and they were studious that no one likely to disgrace their body should be admitted to their ranks. He hoped that presently it would become the recognised thing for employers to ask applicants for situations whether or not they were members of the society. At the moment they were a new kind of employee in a new movement, and he would remind them that Mr. H. G. Wells had prophesied that the intelligent man of the future would be the one skilled in mechanics, that being the writer's test of increasing intelligence. He felt sure they were rapidly enlisting the sympathies of all the great motoring associations, and the R.A.C. was sure to support them.

In acknowledging the toast Mr. George T. Clarke briefly recapitulated the history of the society. Three years ago when people got on a car they usually said, "Oh, I do hope we'll start." Nowadays, however, the only trouble seemed to be changing tyres. The society was establishing examining branches for candidates in all the chief cities; and it hoped that employers would speedily realise that the driver was the man who really looked after their property. The society hoped to gather to its membership the genuine article only, and so keep up a fair standard of wages for the motorman.

MARINE MOTOR ASSOCIATION.

AT the annual general meeting of the Marine Motor Association, Lord Montagu of Beaulieu was re-elected president. Captain R. T. Dixon, R.E., and Mr. W. Miall Green were elected vice-presidents, and Mr. O. B. Colls was appointed hon. treasurer. Messrs. F. C. Blake, H. W. Hutchinson, R. S. L. Markham, S. E. Saunders, and J. A. Rennie were elected to the council, and the result of the ballot for vacancies was the election of Messrs. P. Bonthron, Charles Burgoine, L. Miles, J. Day, H. G. Vereker, J. Wood, and M. M. Robins.

The annual report, which was adopted, stated that the association continued to receive the support of every important club in the United Kingdom, and practically the whole of the motor-boat racing in this country was carried on under its racing or rating rules, or both.

MOTOR CLUB.

THE Motor Club held a successful house dinner on Wednesday. After dinner there was a concert in the theatre. This was the last held in the theatre, as great alterations and improvements are shortly to take place. The theatre is to be turned into a billiard-room, and above it will be a large smoking-room, the billiard-room being so constructed that it will still be available for concerts.

The club motor runs, arrangements for which are also in hand, will be announced at a later date. The continued increase of members is phenomenal, over 600 having been enrolled since the new year.

CRYSTAL PALACE.

TWO somewhat important variations have been made to the published conditions of the Crystal Palace Club's open flexibility competition, fixed for April 11th next. Owing to the action of the Royal A.C. in dividing the second of the "Touring Car Standards" into A. and B. sections, the first class in the flexibility competition has been extended to include cars up to 9.4 engine rating, the second class taking cars over 9.4 up to 16.0 engine rating.

The other point is, that it having been found that several of the bodies fitted to cars not giving a sufficient total wind resistance area to comply with the requirements of the touring car standards, the R.A.C. have given permission for the area to be increased by the addition of a screen or board, provided it is not of an objectionable nature.

BASINGSTOKE.

A PAPER on "Carburettors and Carburation" was read by Mr. W. Webber before the above club on the 25th ult. Mr. Webber commenced by explaining the duties of a carburettor, and with the aid of drawings and models described early types, as well as some of the latest. De Dion surface, Lanchester wick, and Longuemare spray were chosen as examples of three different principles applied to carburation, whilst a sectional model of the T. and M. multiple jet carburettor, lent by Messrs. Trier and Martin, proved of great interest to all present. The discussion which followed became at times somewhat heated, and the chairman, Mr. H. Williams, had on one occasion to call for order. One member strongly advocated the wick type carburettor, another variable jets, whilst considerable argument prevailed as to whether or no a weak mixture at high speed was desirable. It was decided, at the suggestion of the chairman, to adjourn further discussion until a special general meeting could be convened for the purpose. Votes of thanks to lecturer and chairman were carried unanimously.

Application for affiliation to the A.C.U. has been made, which body has agreed to affiliate motoring members only, considering the peculiar position of the club, which divides its membership between motoring and non-motoring members.

On the 4th inst. Mr. F. Baron will read a paper entitled "Some Sights in a London Motor Omnibus Garage," and on the 11th inst. a special general meeting to discuss the summer programme will be convened.

LINCOLNSHIRE.

A WELL-ATTENDED committee meeting of this club has been held at Stamford. Major J. A. Cole, J.P., was re-elected chairman of the committee, and Mr. A. A. Padley vice-chairman. Mr. E. R. Simpson was elected hon. treasurer. Mr. J. H. Bainton was elected to the vacant place on the committee. The following were elected representatives of the club on the General Committee of the Motor Union:—Sir Hickman Bacon, Bart., Major J. A. Cole, Capt. C. J. E. Parker, Dr. Gilpin, Mr. A. A. Padley, and Mr. Godfrey Lowe.

The position as regards the threatened increase of motor taxation was considered, and the Chairman pointed out that neither he nor any member of the Motor Union had ever advocated increased taxation, but that the policy adopted had been rather to point out that there was no justification for increased taxation. Should, however, such a thing occur the money raised from the taxation of motors should be pooled, and devoted to assisting local authorities to improve the roads.

The special general meeting for the discussion as to future affiliation was fixed for Friday, May 8th, at Lincoln. The membership of the club is now 242.

KENT.

THE annual meeting of the Kent A.C. was held at the Royal Star Hotel, Maidstone, on the 21st ult., Mr. C. J. Morgan being in the chair. Correspondence was read from Mr. W. B. Prosser, the clerk to the Kent County Council, with reference to the thoughtlessness of some drivers of motor-cars when meeting horse-drawn traffic, and urging that motorists should keep to the near side of the road. Mr. H. P. Maybury, the surveyor to the County Council, also wrote in the spirit indicated in our Comment on page 89 of the issue of last week. The Chairman said that he was thoroughly in accord with the opinions expressed in those letters, and doubtless all members of the club will bear the suggestions in mind. Mr. W. W. Willis was elected chairman of the club for the ensuing year, with the following gentlemen as members of the committee:—Messrs. A. H. Reed, Dr. Tamplin, W. W. Willis, H. J. Fraser, H. P. Maybury, Col. Edward Latter, Dr. Styan, C. E. Wright, and Dr. R. T. Bowden.

Dr. Charles Firth, Capt. Page, and Mr. Granville M. Kenyon were elected as representatives of the general committee of the R.A.C.

MANCHESTER.

FINE weather favoured the opening run of the Manchester A.C. on Saturday to the Brine Baths Hotel, Nantwich, and about fifty cars joined in it. A speed-judging competition was arranged between Middleswich and Nantwich, where the competing cars had to travel at a specified speed, those cars which most nearly approximated to the correct speed and not exceeding it being adjudged the winners. The first prize went to Mr. A. W. White, who was within 1½ sec. a mile of the prescribed time, and the second prize to Mr. G. J. Crawford, with an error of only 2½ sec. a mile. Among those with an error of under 10 sec. were Messrs. R. Williamson, D. W. W. Parry, J. L. Tattersall, A. C. Tattersall, W. Jackson, G. B. Schwabe, E. Allen, J. A. Morris, R. Crossley, T. Hooydonk, F. J. Kerr, W. J. Stonier, A. G. Holmes, S. Lawton, and J. W. Taylor. As speedometers were covered up the competition afforded an interesting proof of the ability of the driver to judge the exact speed at which he was travelling.

COVENTRY.

SIXTY-THREE members and friends of the Coventry Motor Club recently journeyed to Stratford-on-Avon, fourteen motor-cars and the same number of motor-cycles participating in the event. The membership of the club now runs into three figures, and an attractive programme for the 1908 season has been arranged.

LADIES'.

ON March 26th, Mr. and Mrs. Cordingley invited the members of the Ladies' A.C. to visit the thirteenth Motor-Car Exhibition at the Royal Agricultural Hall, Islington. After inspecting the various exhibits, the members and their friends were received by Mrs. Cordingley in the club-room, just over the Exhibition offices. Here a ladies' orchestra played several selections of well-known favourites, while the members partook of tea and discussed the many novelties that had attracted their attention.

The "Thames" 50-h.p. Six-Cylinder Car recently supplied to Mr. Dunkerley, of Wargrave, by Messrs. W. T. Clifford Earp, Ltd.

The car is a seven-seater and is fitted with Cape cart hood and a double glass screen. An exceptional feature is the manner in which the frame is covered in with a painted screen extending from body to platforms.

SOUTHERN.

THE sixth annual meeting of the Southern Motor Club was held at headquarters on the 26th ult. It was reported that the receipts for the year showed an increase of £114 over those of 1906, while the assets now amount to £66, giving a surplus of £14 after carrying £30 to reserve. It was resolved to call a general meeting in sufficient time to give the requisite six months' notice to cancel the agreement either with the R.A.C. or the M.U. Hearty votes of thanks to the retiring officers concluded the proceedings.

SCOTTISH.

THE magistrates of the Committee of the City of Glasgow have agreed to accept the certificate of the Scottish Automobile Club as sufficient evidence of the competency and efficiency of drivers of motor-cabs in the city. It will consequently be necessary for each driver, before applying for his licence, to submit himself for examination by the Scottish Automobile Club.

At the last committee meeting of the club a report and data—the results of special observation—with regard to the driving of motor vehicles through villages and populous places was submitted, and the committee agreed to urge on members of the club and motor owners generally the necessity of observing moderate speeds in driving through towns, villages, and populous places, and they are solicitous that this moderation should be as apparent where no limit notices are exhibited as where restrictions have been imposed, as this in such cases is but a courteous acknowledgment of the attitude of those authorities who have refrained from seeking restrictive regulations. It is hoped that motor-car owners will take every means of ensuring an observance of this recommendation on the part of their drivers.

THE annual meeting of the Dundee and District Motor Cycle Club was held on the 25th ult., when an attractive programme for the season was drawn up.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.

Robert Yule, of Upper Norwood, was summoned, at Croydon, for driving a motor-car at a speed exceeding twenty miles an hour on the Brighton road, on February 23rd. Mr. Muskett, who appeared for the Commissioner of Police, asked the Bench to suspend defendant's licence. This gentleman, he said, was a notorious offender with regard to the Motor Car Act. He was convicted for exceeding the speed limit in October, 1906, at the Marylebone Police Court, and fined £5, and at the South-Western Police Court in October, 1907, for a similar offence, he was fined 20s. and costs. On September 28th, 1907, defendant was fined £7, and 6s. 6d. costs, by the Croydon County Bench for exceeding the speed limit, and in September, 1908, £10 for driving in a dangerous manner at Leytonstone. He had also been convicted at Marlborough Street Police Court for exceeding the limit in the park, when he was fined £2, and another conviction against him was for failing to produce his licence. The Mayor said the Bench were not unanimous as to the suspension of the licence. They did not, therefore, propose to take that course. As this offence had been so many times repeated, defendant would be fined £20, and £3 6s. 5d. costs.

Five motorists, including Miss Dorothy Levitt, have been fined at the Guildford County Bench for exceeding the 20 m.p.h. limit.

At the Bromley Petty Sessions fines of £5 and costs have been inflicted on four motorists who exceeded the legal limit on Bromley Common.

ROAD REPORTS.

LONDON.—We understand that the police have a nightly "control" on Constitution Hill, the measured distance being from Hyde Park Corner to Buckingham Gate.

BATTERSEA.—The police are daily watching motorists in the Latchmere Road, Battersea, a road that is largely used by those going from the West of London to Balham and Streatham.

YORKSHIRE.—Just outside Wetherby, at the junction where the Leeds and Wetherby road turns towards Boston Spa, is a corner which has been the scene of many motor-car accidents during the last few years. A collision between two mechanically-propelled vehicles last week end suggests that the local authorities might well consider whether something could not be done to round the corners, as is the case on many of the southern roads.

WADHURST.—At the Wadhurst (Sussex) Parish Council it has been reported that automobilists have furnished four danger signal boards to be voluntarily erected in the vicinity of the schools at Wadhurst and Consley Wood. The managers of the schools have promised to maintain them.

CHERTSEY.—At the meeting of the Chertsey Rural District Council a letter was read from the Surrey County Council Surveyor, asking the Council to state specifically the lengths of roads which in their opinion were dangerous for motor-cars to traverse at the ordinary legal pace. The member for Thorpe, a village lying between Chertsey and Egham, said cars were continually going through that village at a tremendous

The Delahaye Petrol Motor Fire Engine recently supplied to the Paris Fire Brigade.

[De Auto.]

For exceeding the legal limit ten motorists were fined £5 each at Kingston on the 28th ult.

On Monday two motorists were fined £3 each at Feltham for exceeding the ten-mile limit in Bushey Park.

At the Epsom Petty Sessions, on Monday, Percy Patley, chauffeur to the Earl of Rosebery, was summoned for driving a motor-car at a speed exceeding twenty miles an hour at Cheam on March 7th. Defendant said they were using the road two or three times a week, and never took less than an hour to go from Hyde Park Corner to the Town Hall, Epsom. He had been strongly cautioned by his employer against exceeding the twenty-mile limit. The chairman said that defendant would be fined £5, and 9s. 6d. costs.

LORD ALINGTON has been re-elected president of the Dorset A.C.

LORD RONALDSHAYE has become a patron of the North Middlesex Automobile Club.

MR. EDWIN CROSS, of Blackburn, has been elected assistant secretary of the Lancashire A.C. at a salary of £25 per annum.

By one post recently the Stepney Spare Motor Wheel, Limited, received from Australia orders for no less than fifty-one wheels from four different firms in various parts of the Colony. The company have now completed arrangements by which the Daimler Company are carrying a complete stock of Stepney wheels both at their showrooms at, Plaza de Colonque 3, Madrid, and also at their garage at San Sebastian, Spain.

speed. He urged that something should be done to stop such great rates of speed, as there were winding roads entering and leaving the village. It was decided that the surveyor of the council should make a report at an early date.

TARROADS.—A number of engineers and surveyors were invited by the Taroads Syndicate to a practical demonstration of tar-spraying and grit-spraying machines in Vincent Square, Westminster, S.W., on Monday. After the tar-spraying machine had covered one side of the road the grit-spraying machine, drawn by a single horse, followed, and covered the newly-tarred surface with finely-ground granite. This permitted the road to be walked on without the objectionable nuisance of the tar affixing itself on the boots of the traverser. Both machines clearly demonstrated labour saving, as the whole operation over some 200 yards of the road was effected in a few minutes. The grit-spraying machine was fashioned after the style of those water-carts that have a revolving wheel at their back, on which the water falls, and is instantly flung off in a spray. Instead of a water-tank a hopper containing the gritting material is carried by this machine, and the distributing wheel is worked by a chain from the wheels of the vehicle.

THE COVENTRY CHAIN COMPANY, LTD., have now taken up the manufacture of nuts and bolts for the motor trade, a special point being made in turning them accurate to size within one and a half thousandths of an inch.

BUSINESS AT THE CORDINGLEY SHOW.

QUITE recently I had occasion to explore the immense pile of old literature I am burdened with (there must be nearly three tons of it), in search of certain early cycle history. Amongst other relics of the past, I turned up the original prospectus of the first Cordingley Show at the Agricultural Hall in 1896. There were very few motors there then, but the number steadily rose, and for long it was practically the only show, and received the official support of the Automobile Club. Then the Motor Traders and Manufacturers' Association rose into power, and made Olympia the official show ground. Despite this ban, the "Original" show has done well, and there is a very interesting exhibition collection of cars present—including very many which are not supposed to be seen outside Olympia—in London at least. In fact, some of the self-same cars, unless my eyes deceive me, are at Islington which figured in Hammer-smith, Mercedes, Daimlers, Panhards, Crossley, Napier, Rochet-Schneider, Brasier, Junior, Renault, Berliet, Unic, Darracq, &c., are either there or are due—so there are not many missed.

Anyhow, I spent over eight hours in the Hall on Saturday, going through the exhibition, which is full of interest, and includes several recent types of motor-bicycles and cars which have not before been seen in public. Coming just at the opening of spring, the best buying period, business ought to be brisk. While I was waiting to interview an exhibitor, I heard a visitor place an order for a new Renault.—"Athletic World."

AUTOMOBILE ACCIDENTS.

AN inquest was held at Loughborough, on the body of Joseph Pratt, aged 67, who was fatally injured in a motor-car accident on the previous day. In the course of the inquiry it was shown that the deceased, after hesitating as to which way to go, turned back and was struck by the car. A verdict of "Accidental death" was returned, the jury adding that no blame attached to the driver of the automobile.

THE Hertfordshire police are searching for a motorist who is alleged to have knocked down a woman of sixty named Florence Crocker, near St. Albans. The injuries received were so severe that the woman died in St. Albans Union on Tuesday. She had evidently been struck in the back, and no help arrived for about two hours. When found Mrs. Crocker said she had been knocked down by a motor-car, but was unable to give any further information. The injuries indicated that she must have been struck by a car going towards St. Albans, in which direction she was walking.

DAMAGES AGAINST A MOTOR-BUS COMPANY.

THE case of Parker v. the London General Omnibus Company and the London Road Car Company came up in the Westminster County Court, on Monday, as an action by a cab proprietor for damages to a horse and cab. Mr. E. F. Lever, who appeared for the plaintiff, said the claim arose out of a collision in a stretch of roadway in the Strand, which, he was told, was used as a motor vehicle racecourse, the highway in front of the Savoy and Cecil Hotels. The cab was being driven westward when the defendant's motor-omnibuses collided with the cab. The plaintiff claimed against the Road Car Company, and the reply was that the London General Omnibus Company was to blame, and when a claim was made against the London General Omnibus Company they said the Road Car Company was to blame, so both were sued. The case lasted the whole day, twenty-six witnesses being called, and Judge Woodfall said he never heard so many witnesses supplying different versions of what occurred. He found for the plaintiff against the London General Omnibus Company for £49 18s. 6d., with costs, and the London General Omnibus Company must also pay the London Road Car Company's costs.

COMPANY NEWS.

THE AUTOMOBILE CO-OPERATIVE ASSOCIATION, LTD.—Presiding over the second annual meeting of the shareholders of this Association at the registered offices, 1, Albemarle Street, Piccadilly, W., Mr. Jules de Meray, the chairman, referred to the extensive and profitable nature of the past year's trading. He reported a considerable increase of membership. A dividend of 17½ per cent. was declared. It was recommended in connection with the option given to members of increasing their holdings to the extent of £210,000, that further capital should not be called up except by resolution of a special meeting of the members.

WE learn that Weigel Motors (1907), Ltd., have removed their works to Olaf Street, Latimer Road, London, W.

OF the tyres fitted to cars exhibited in the Cordingley Motor Show, 222 were Dunlops, this number exceeding the number of representatives of any other of fourteen makes of tyres fitted.

THE motor reliability trial recently promoted by the Canterbury (N.Z.) Automobile Association proves to have been the largest and most successful ever contested in New Zealand. The awards were recently made public, the judges awarding the first prize for cars under 12-h.p. to the 10-h.p. Cadillac driven by Mr. W. Felton. The same car was also awarded the Dunlop Rubber Company's special prize "for the most meritorious performance in the whole trial," and another special prize for "the best performance of any car selling in England for less than £350."

PETROL MOTOR-BUSES.

THE last paper discussed at the general meeting of the Ipswich Engineering Society was read by Mr. C. C. B. Morris, G.I. Mech. E., of London, and entitled "Petrol Engines and Motor Omnibuses." Mr. Wilfrid Stokes (President) was in the chair, and Mr. Morris said that his main object was to bring forward for discussion some of the principal points in connection with the design of petrol motor-omnibuses. There were three factors which tended to excessive noise—(1) bad roads, (2) excessive weight of chassis, as at present used, (3) bad driving and speed-changing. The first two factors were mainly dependent on each other. Given a good road surface, the heavy chassis would run as silently as the light type; the lighter the chassis, of course, the less the wear and consequent noise caused by bad roads. The heavy type of chassis now being used on country routes would probably be superseded by a light type constructed to carry about eighteen passengers, and of about 14-h.p. A bus should be designed to carry as its maximum load a number of passengers corresponding to about 25 per cent. more than the probable number of passengers that would be carried per mile over the route on which the bus was to run. With the present type, the average load per mile was more than 100 per cent. less than the total carrying capacity, the result being that the engine had to drag about with it a chassis far heavier than was necessary, with correspondingly heavy petrol and repairs bill.

THE NAVIGATION OF THE AIR.

PROFESSOR HELE SHAW, in delivering the Howard address at the Royal Society of Arts on "The Navigation of the Air," said that the most important matter in aerial navigation was not to secure safe support in the air so much as to be able to move in the air in any direction. In

The New Mercedes Chain Case.

The above illustration shows the construction of the chain cases now fitted to over a hundred Mercedes cars supplied by Daimler Mercedes, Ltd. The ingenuity of design, small number of parts and cleanliness of workmanship are obvious from the pictures, and it need only be added that these chain covers have been found in use, to deaden sound, economise lubricant, lessen dust and enormously increase the length of life of the driving chains.

reviewing the different types of navigable balloons, he remarked that the invention of Zeppelin, which had been purchased by the German Government, had attained the greatest speed of thirty-five miles an hour. It was sixteen-sided, and the cover was made of aluminium. He also entered into particulars of the various airships constructed by Santos Dumont, and concluded by remarking that the question of perfecting an aeroplane which would travel at sixty miles an hour was now only a matter of time.

THE 1908 list of Continental motor tyres includes a useful list of accessories, including canvas covers, lamp covers, indiarubber water cans, bulbs for horns, waterproof bags, &c.

MESSES. SAMUEL BROS., LTD., of 65 and 67, Ludgate Hill, London, E.C., are opening a new department exclusively devoted to the clothing requirements of motorists.

FROM Gavarnie, 1,360 metres above sea-level, Capt. G. Gaunt, R.N., writes:—"The 10-12-h.p. Coventry Humber, after 2,000 miles in France, came up here through the snow beautifully. This car has now travelled between 14,000 and 15,000 miles."

MESSES. JOHN HADDON AND CO. have removed to their new premises in Salisbury Square, Fleet Street, London, E.C., adjoining those which they have occupied for so many years.

MESSES. BROWN BROTHERS, LTD., have taken up the representation of "Autoclips" motor lamps from G. W. Houk, Ltd., and all orders for this class of lamp should in future be addressed to the first-named company.

FORTHCOMING EVENTS.

APRIL.

- 4th (Sat.).—Auto Cycle Union dinner to road-menders on the Ripley road at the Anchor Hotel, Ripley.
Last day of Commercial Vehicle Exhibition at Olympia, London.
- 11th (Sat.).—Annual open Flexibility Contest of the Crystal Palace A.C. Opening meeting of the Nottinghamshire A.C. at Edwinstowe.
- 16th–20th.—Easter Tour of the Motor Cycling Club.
- 17th (Good Friday).—Lincs. M.C.C. meet at Mablethorpe.
- 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.
- 25th (Sat.).—Open Motor-Cycle Hill Climb of the Hertfordshire C.A.C. Opening meet of the Yorkshire A.C. at the Hotel Majestic, Harrogate.
- 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F.
- 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Epping.

MAY.

- 2nd (Sat.).—Impromptu pace judging competition of the Sheffield A.C. at Ollerton.
- 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
- 10th (Sun.).—Targa Florio Race.
- 16th (Sat.).—Fifty miles Consumption Trial of the Hertfordshire C.A.C.
- 21st (Th.)–25th.—Reliability Trial of the Irish A.C.
- 23rd (Sat.).—Clipstone race meeting of the Notts A.C.
Meeting of the Yorkshire A.C. at Helmsley.
Meet of the Motor Union at Lincoln.
- 25th (M.).—Industrial Vehicle Competition of the A.C. de France.
- 28th (Th.).—Visit of the Aero Club to Aldershot.
- 30th (Sat.).—Meet of the Herts C.A.C. at Hatfield Park.
- 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
- 6th–8th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
- 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
Start of the International Touring Car Trial of the R.A.C.
- 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
- 13th (Sat.).—Hill climb of the Notts A.C. at Oakmoor.
Speed Trials of the Lincs. A.C. at Grimsthorpe.
- 15th–19th.—Scottish Reliability Trial.
- 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
- 27th (Sat.).—Hill climb of the Midland A.C. at Shelsley Walsh.
Saltburn beach races.
Buxton meet of the Manchester and Lincolnshire clubs.
Members of the Cheshire A.C. will participate in the Gymkhana of the Manchester A.C.
- 28th (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
- 6th (M.).—Grand Prix A.C.F. (Voiturette section).
- 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
- 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
- 18th (Sat.).—Annual Gymkhana of the Herts C.A.C. at The Grove, Watford, by permission of the president, the Earl of Clarendon.
Meet of the Liverpool and Cheshire A.C.'s at Delamere.
- 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club.
Annual Open Hill Climb of the Midland A.C.
- 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

AUGUST.

- 29th (Sat.).—Meet of the Lincolnshire Motor Club at Lincoln.
- 30th (Sun.).—Southend M.C. run to Great White Horse Hotel, Ipswich.

SEPTEMBER.

- 5th (Sat.).—Aston Hill climb of the Herts C.A.A.
- 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

Secretaries of automobile clubs are invited to forward their programme of fixtures as soon as arranged.

INTERNATIONAL TOURING CAR TRIAL, 1908.

ENTRIES for this event at single fees closed on Tuesday. The following firms have entered:—De Dion Bouton, Ltd. (2), Anglo-American Motor Car Company, Ltd., Humber, Ltd. (4), Vauxhall Motors, Ltd., Hillman-Coastalen Motor Car Company (2), Brown Bros., Daimler Motor Company (2), Rolls-Royce, Ltd. (2), White Company, Ltd. (2), Deasy Motor Manufacturing Company (2), Clement-Talbot, Ltd. (2), Panhard and Levassor (3), Benz et Cie., Milnes-Daimler (Mercedes), S. F. Edge, Ltd. (2), Sir W. G. Armstrong Whitworth and Co. Seventy cars have entered for the Scottish Trial.

The following have expressed their intention of entering:—Ariel Motors, Ltd., Singer Motor Company, Charles Jarrott and Letts (De Dietrich), Star Motor Company, Sheffield Simplex Motor Company.

BUSINESS NEWS.

As an instance of the great strides made by the Daimler Company in their export business, it is interesting to note that a 42-h.p. limousine has just been shipped to the Auto Agencia, Bolhao, Portugal.

IN these days much convenience is experienced by the motoring public when motor goods bear a distinctive name. It greatly simplifies the task of selection, and is a business aid as well as a public convenience. Messrs. G. T. Ritchies and Co., the well-known accessory firm of 19, Store Street, London, W.C., have just registered the name "Orno," worked in a special design as a trade-mark, and in future all the firm's special lines will be known by the name of "Orno," such as "Orno" tyre pumps, "Orno" oil, &c.

MESSRS. JARROTT AND LETTS have lately received orders for the latest 12-h.p. Sizaire cars from Lord Somers, of the 1st Life Guards; Mr. G. F. Ferrand, of Liss; Mr. G. B. Hynes, of the Royal Artillery, Shoeburyness.

FROM Messrs. Woodnutt, of St. Helens, Isle of Wight, comes a copy of the catalogue of their patent self-contained heavy oil vaporizer and carburettor. The details of this apparatus are not only fully described, but very completely illustrated; the carburettor has recently been considerably improved, and is now being largely used for marine motor purposes.

THE LEABORNE MANUFACTURING COMPANY, of Harrow, have given an exhaustive test to Coventry chains, and have expressed satisfaction as to the way in which they withstand stretching.

MESSRS. BROWN BROTHERS, LTD., have taken over the representation of "Autoclipse" Motor Lamps, and all orders for these should now be addressed to 22–30, Great Eastern Street, London, E.C.

OWING to the increasing demand for Ford cars Messrs. Perry, Thornton and Schreiber, Ltd., have found it necessary to secure premises and undertake their own coach work and body alterations. In future all such work will therefore be carried out under their direct superintendence.

MESSRS. J. LIVERSIDGE AND SON, LTD., of 561, Old Kent Road, London, S.E., have received a letter from a private motorist, saying that he has travelled 4,000 miles with Scott non-skid treads on his tyres and that they are little the worse for wear.

AT the automobile show and motor gymkhana held at Bombay early last month Siddeley cars were highly successful. In the gymkhana no fewer than six first and two second prizes were awarded to owners of these vehicles. They had several more wins to their credit, but were precluded from receiving prizes by the rules limiting individual competitors to three prizes only.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27–33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, APRIL 11, 1908.

[No. 475.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

AT the Surrey Quarter Sessions at Kingston, on Tuesday, the justices made an order confirming the diversion of a footpath in the parishes of Byfleet and Chertsey, which crosses the motor track at Brooklands, Weybridge, and sanctioning the substitution of a new footpath in its place. The footpath, which has thus been done away with, was probably the most dangerous in the county.

When the motor racing track at Brooklands was laid out there was an informality in the proceedings for the diversion of the footpath, with the result that it remained open to the public at every race meeting last year, and as it crossed the track in two places, it was used at considerable risk by hundreds of people. In addition to this, the path crossed the main line of the London and South-Western Railway, close to the Brooklands track, and the danger to persons using it was so great that a staff of railway officials were always on duty there during the busy days to prevent accidents. The justices, who had inspected the old and new paths, expressed the opinion that the diversion of the old one would be the means of preventing serious accidents.

Police Traps Again.

THE return of spring-like weather has brought the southern police from their hiding places, and police traps are again in operation on all the roads where they have been familiar during the past few seasons. It is significant, too, that those stationed at the Slaugham Crossways, at the foot of Handcross Hill, have altered their tactics, and instead of charging their victims with exceeding the speed limit have summoned them for driving to the common danger. One witness in a case heard at Haywards Heath, on Monday, said he had counted 303 and 337 motor-cars through Handcross village on two successive Sundays. The police are, therefore, depending more than previously on allegations of dangerous speed, and the magistrates apparently intend to encourage such a course.

Organised Foreign Tours.

IN the latter years of the last century organised excursions of French motorists to the southern coast of England were a regular feature of the year's programme, but the growth of the movement seemed to destroy the social spirit that was pronounced among motorists in the early days. Latterly, however, the charms of foreign travel have tempted a good many motorists in all countries to leave their own shores, and this tendency has been as marked on the part of British owners of cars as of those on the Continent. Recognising this, the Motor Union is contemplating the organisation of tours which should prove popular among its members. The excellent roads, good hotel accommodation and fewer restrictions on speed, that add to the pleasure of travel in France, have suggested that an experiment should be instituted by the Union for a ten days' or fortnight's visit to the valley of the Loire and the famous chateaux of that district. Arrangements will be made for the passing through of the cars at Havre, and

hotel accommodation will be arranged in advance. The nightly stopping places will be about sixty to seventy miles apart, and alternative routes will be drawn up so that the fastest cars can, if their owners desire, run longer distances than the smaller vehicles. This is necessary, as, besides the good roads that will be traversed, the spectacle of a number of cars travelling together when the days are fine is not without its dusty recollections to those who will participate in the forthcoming event. Should this new venture of the Motor Union be successful at Whitsun, other tours in Normandy at the beginning of July in connection with the Grand Prix will be organised. In any case the experiment should be interesting.

Facilitating Individual Travel.

IN connection with foreign motor travel, reference may also be made to the way in which the Automobile Association is catering for the requirements of individual motorists going abroad, and the interesting article by Mr. Stenson Cook on another page will convince motorists who wish to spend a few days on the Continent that they can do so without encountering many difficulties when entering France. Thanks to the various motoring organisations, there is no doubt that the present year will see a great migration of motorists from this country to the Continent, and we trust that at the same time we shall have many visitors from Europe using our roads, taking care, of course, not to increase the expenses of the trip by visiting the various courts which are established not only for the punishment of malefactors but also the fining of those who are lucky or unfortunate enough to own a speedy means of locomotion.

On the Towpath.

AT the last meeting of the Thames Conservancy Board a letter was read from the East and West Molesey Urban District Council stating that annoyance was caused to pedestrians by motor-cars using the towpath above Molesey Lock, and asking the conservators to prohibit such vehicles on that stretch of roadway. It was pointed out that there were notice boards on the towpath already prohibiting its use by automobiles, and the Board have sanctioned a recommendation instructing their officers to take the names of persons driving motor vehicles on the path, with a view to summonses being issued against them. Probably the Conservancy Board regards itself as outside the ordinary range of local authorities, and quite superior to the ordinary form of elected public body; but it is questionable whether the Local Government Board will allow it to prohibit vehicles in this way without some inquiry by the central authority and a report to that effect from the L.G.B. inspector.

The Herefordshire Hill Trials.

THE Herefordshire Automobile Club are to be congratulated upon the success with which they have surmounted the difficulties raised by the Bromyard Rural District Council in respect to the hill-climbing trials for the Hereford trophy. They attacked the difficulty in the true hill-climbing spirit, and the result is a most satisfactory one. The Cockshut Hill, Putley, which has been selected, although not possessing so consistent a

gradient as Frome's Hill, has many other qualifications which should commend it. It is a little over three-quarters of a mile long, and has a total rise of 300 feet and an average of 1 in 13.54, while in its steepest part it reaches the gradient of Frome's Hill—1 in 6.3—for a distance of 700 feet. At the top is an excellent open space for spectators to watch the competitions, and there are two other roads by which the cars can return to the bottom of the hill. From the scenic point of view the hill is most charmingly situated, rising sheer from the valley formed by the Malverns and the Woolhope Hills. In our Club news this week will be found the discussion of the Herefordshire A.C. which decided the event.

Watling Street.

THE news that the R.A.C. intends to press forward the work of sign-posting Watling Street is of general interest. We understand that the preliminary survey has been completed, and very little time will now elapse before the whole work has been accomplished. The object of sign-posting Watling Street is to bring into use one of the ancient main thoroughfares of this country. The road is in excellent condition, and there is very little traffic, but all the principal centres of England can be reached from it. Apart from the Great North road, Watling Street is, perhaps, the most important thoroughfare of the country.

The Motor Club Party on their Launch starting out for the Boat Race on Saturday last.

Another Corner Gone.

JUST as travel is said to knock the rough edges from men, so motoring is responsible for clearing many obstructive corners from the highways. These have long been a source of danger to users of the road, but until a few motor-car collisions had occurred it never dawned upon anyone that the removal of high hedges and sharp corners would add to the safety of the highway. Now the truth is clear. Those who journey along the delightful roads and lanes that skirt the banks of the Thames are familiar with scores of such places, and will be glad to hear that many are doomed. One such is at the junction of the London and riverside roads at Hampton. Mention of the Red Lion will recall the location to many motorists, who will be interested to know that the work of demolition has begun, and that the corner is to be widened. This inn has been a landmark for ages. It was standing before Hampton Court, and was the headquarters of the artificers whom Cardinal Wolsey employed on the building. Then in Stuart days it knew magnificence; literary men haunted its benches in the days of Queen Anne, and roystering scenes were enacted in coaching days, when it was the posting place at which horses

were changed by those bound for Windsor from London when the Court was in residence. These days are but memories now and motorists will rejoice at widened corners.

A Candidate on Cars.

AWAY in the Highlands is the constituency of East Perthshire, which is being wooed by political candidates of opposing sides. One of them—we will not refer to which colour he adorns—was informed at a public meeting in the Public Hall at Burrelton that “he was a strong opponent of a certain evil invention called the motor-car. As he said not very long ago, he had never even touched one with a pair of tongs, and certainly he had never been in one. His friends ought to know what his remedy for motor-cars was. He would put the whole blooming lot in the sea as soon as he could.” Such a declaration sounds as scarcely utterable in these years of the Twentieth Century. Certainly it does not indicate that intelligent appreciation of modern movement that we expect at Westminster, and it is probably fortunate for both the speaker and the motoring movement that he has not yet reached the House of Commons.

Accessories for Cars.

Now that Easter is within measurable distance motorists are naturally looking at their cars and will doubtless find many points of improvement requiring their attention. “New lamps for old” will be a much-heard plaint; accumulators will require overhauling; electrical accessories generally will need attention; tool bags and kits will probably demand replenishment; the tyre outfit will warrant a few additions, and everything that is needed by either the car or the driver demands a little thought and, in all likelihood, some expense. Hence the interest that attaches to the series of novelties that are now being described in “Here and There” and other columns of the *Journal*. We welcome suggestions from practical motorists as to the particular accessories which they have found of value and containing special merits beyond the ordinary range of such goods.

Motor-cars v. Cruelty.

AN aspect of the motor movement that should prove a strong argument in its favour with all who love animals was emphasised at a meeting at Limerick the other day. It is not new to most of our readers, but is sufficiently true to warrant reiteration. Sir Thomas Cleve, of that Irish city, is head of a firm employing ten steam motor vehicles, which he finds a great saving as compared with the old horse lorries formerly employed. He was advocating the extension of motor traction in Ireland, and went on to say that they had an association in the county of Limerick which concerned itself with the protection of animals. In that respect he thought the long distances in summer, and carrying very heavy loads, constituted acts of cruelty. If the motor vehicle had done nothing else but obviated that, he thought it had done much. As far as his firm was concerned they would be very sorry to go back to animals, both from the point of view of economy and of saving burdens to horses.

The Sunday Sale of Petrol.

LAST week we mentioned that should the Sunday Closing (Shops) Bill leave the House of Lords in the form in which it has been introduced by Lord Avebury, motor agents and garage proprietors will find themselves prohibited from supplying travellers with petrol, &c., even though they should have motored beyond the new six mile limit advocated by Mr. Asquith in another connection. The matter has been raised at the meeting of the general committee of the Royal A.C., where it was fully discussed. Mr. C. D. Rose, M.P., has consented to act in concert with Lord Montagu and other members of the Legislature in connection with the matter, and Lord Avebury has

adopted an amendment of his measure, so that it may not prove irksome to motorists who avail themselves of their Sundays for travelling. Lord Avebury's published works on the scenery of Great Britain, and the many times he has urged people to explore their native land, lead to the hope that he will not do anything which may lead to thwarting such a desire on the part of many of his countrymen—a result that would assuredly follow the stringent regulation he originally proposed. An addition to the measure, protecting the sellers of petrol and motor-car accessories from the penalties which would otherwise have been enforced against them for opening their shops on a Sunday, has now been inserted by the Standing Committee of the House of Lords.

Motoring in Java.

MANY of the tea planters in the Dutch Indies are becoming enthusiastic motorists, and ere long may realise the commercial as well as the pleasure purposes of the motor-car. Among the leading men is Mr. Van Erp, who owns one of several 20-h.p. White cars which have been put on the road in Java since the beginning of the present year. He is

region of Wharfedale. So far as the prevention of cattle straying on the road is concerned, Mr. L. J. Pankhurst, who is one of the largest flockmasters in Kent, speaking at a sheep farmers' dinner at Haywards Heath last week, said flockmasters had good reason to detest motor-cars, for the manner in which many motorists rode rendered it perilous to walk sheep from town to town. He recognised motor traffic was certain to increase, and suggested that would necessitate flockmasters making more use of the railways.

Central v. Local Control.

MR. CATHCART WASON, M.P., pursues motorists with a persistency worthy of the Surrey police, and from his place in the House of Commons frequently hurls a tongue of defiance at those who travel speedily through his beloved Scotland. Now he apparently desires that the parochial authorities should exercise the powers of control with regard to speed limitations that are at present reserved to the central governments of England and Scotland, for we learn he has given notice of his intention of asking the Secretary to the Local Government Board, whether, in view of the number of accidents caused by motor-cars being driven at a rapid pace through towns

Mr. Van Erp on his 20-h.p. White Steam Car at Batavia.

shown with his family, the photograph having been taken not far from Batavia. Steadily the automobile is winning its way throughout the world, and we welcome similarly interesting evidences of its development from readers in all parts of the globe.

Motors-cars and the Grass.

AN interesting sidelight as to the influence of motor-cars in country districts has just been afforded in Yorkshire. In accordance with time-honoured custom, the Wharfedale Rural District Council have just offered for sale at public auction the "eatage," i.e., the grass along the roadsides in the townships of Timble, Fewstone and Norwood. At one time there was considerable rivalry amongst the farmers for this, but the value of the grass is alleged to have deteriorated owing to the continued coatings of dust, as well as to the fact that the cattle require much more tending now owing to the presence of automobiles on the roads. This year only one third of the usual amount has been realised. The proceeds of the sale go towards the relief of the rates in the particular townships, so that we need not be surprised should resolutions of a violent character against motor-cars be adopted in the near future in the pleasant

and villages, "favourable consideration will be given in future to applications from local authorities for a reduction of speed limit within their jurisdiction." On this point motorists should immediately agree. There is no division of opinion. If exceptions to the uniform rate of speed are to be allowed, they should not be at the whim of any little local council—but power should be reserved to the central authorities, which should be capable of taking a wider outlook than the Rural Council of Slowcoach-on-the-Sloth.

WE learn that the Standard Motor Company, Ltd., of Coventry, are bringing out a new 25-h.p. six-cylinder car, of which, however, only a limited number will be made.

MR. LAWSON WOOD is having a private view of his drawings of "prehistoric motoring humorsities" at the Brook Street Gallery, 14, Brook Street, New Bond Street, London, W.

AT 85A, Blackheath Hill, Greenwich, S.E., Mr. J. D. Wilson has just opened the Hill Motor Car Works, where plant has been installed for carrying out motor-car repairs of all kinds. Mr. Wilson has been appointed the district tyre repairing agent on the Harvey Frost system, and is also laid out to charge accumulators and to supply petrol lubricating oil and other motor supplies.

THE TAXATION QUESTION.

THE change in the leadership of the Government and the possible translation of another member of the Cabinet to the Chancellorship of the Exchequer does not affect the problem of motor-car taxation. Promises of such a fruitful nature as that made by Mr. Asquith when unfolding his 1907 Budget are not likely to be forgotten by any probable successor in 1908. So that the discussion can go on as continuously as though no break had occurred in the order of things.

Rich men pioneered the motor-car in this country. Only those who had personally seen automobiles in France had the enterprise and the wherewithal to run defiance at the legal exactions of their own country. Each year they bought the fashionable car of the season; and thus the idea was spread abroad that the motor-car was the plaything of the wealthy. But that is no longer true; men who never owned a horse now possess a car, and those who felt the maintenance of a carriage stud an expense appreciate the economy and the "handiness" of a car. Consequently, it must always be borne in mind that the motor-car is gradually finding its way into the less wealthy classes, and the tradesman can now run his motor-car as fast as the peer drives his motor-carriage. This tendency, too, is causing the automobile to be ranked less of a luxury and more of a necessity than was the case less than a decade ago. Dwellers in the country, and those who live in towns, use the car as a plea-

any substantial increase in that first year's cost or further addition to the annual charges means a dampened enthusiasm, and, probably, a delay in the purchase of a vehicle. The effect of such depression in the present condition of things is obvious, especially on those great firms that have extended their facilities for production in view of the natural growth of the industry. Basing their development upon the existing condition of things, and surmising that taxation would not be increased, they have sunk their capital; and now come the restraining rumours associated with the Budget.

How greatly the motor movement has progressed under the present system of taxation was shown by Lord Montagu of Beaulieu, in a paper read before the Royal Institution on Friday of last week, in which he gave the following estimates:—

| | |
|--|---------------|
| Capital invested in the motor industry | £12,000,000. |
| Number of persons employed | 300,000 |
| Number of miles run per annum | 3,150,000,000 |
| Number of motor-cars and cycles in Great Britain | 125,320 |
| Value of motor-cars and motor-cycles in use | £29,320,000 |

These figures are those which directly bear on the industry. They take no account of the many subsidiary trades that have been benefited by the coming of the car—industries such as carriage building, steel making, and the hundred and one avenues of employment that have found a measure of prosperity in catering for the new demands of motorists. The estimates represent the work of a decade. During that time prejudice has had to be overcome, interests in the horse and the rail con-

Two of the Vehicles in the Procession of Decorated Cars recently held in Honolulu.

[Allgemeine Automobil Zeitung, Berlin.]

sant means of saving railway fares and the like. It is not altogether an addition to their standing expenses, for there are credit allowances to be made which are of no small moment. The view of the type of man we have in view is admirably dealt with by the Rev. Walter Crick, of Oving, near Chichester, in our Correspondence columns this week. There are hundreds of people now using motor-cars in order to facilitate their work; they do not indulge in speed to any extent, their tyres are free from road-disintegrating projections, and their cars are not weighty. In fact, they are used almost for "pottering about" in their own districts, and for nothing more. To increase their taxes would be manifestly unfair, as well as unwise in the general interest of the country.

Nowadays the new adherents of motoring are anxious to know something of the cost of upkeep. They are keenly concerned as to the maintenance of the car, the expense of tyres, the details of insurance, and the scores of monetary matters that enter into the calculations of the man who owns a car. Naturally the questions of licence and registration fees first occur, and the prospective motorist is faced with an initial outlay of twenty shillings for the registration of the vehicle; then follow the annual driver's licence, five shillings, and Inland Revenue licence of two guineas should it weigh less than 20 cwt. So that, with the cost of number plates, &c., a five-pound note is nearly disposed of straightaway, and an annual charge of £2 7s. incurred so long as the car is used. To the man of moderate means

ciliated, and a general educational policy carried through. It may safely be anticipated that the advance in the near future will be accelerated, and that, now the industrial vehicle is extending an interest in the automobile to another large class of the community, progress will be rapid indeed.

But, at the moment, the trade is undoubtedly suffering adversely from the uncertainty of the situation, and the tension is fairly universal throughout the country. If the Chancellor can be persuaded to keep his demands from the motorist to reasonable limits all will be well; but should he actually propose such additions as some seem to suggest are within his thoughts, a serious set-back will have been inflicted on an industry which is having a powerful effect for good on many aspects of our English life.

MESSRS. DUBAUX, FRERES AND Co., of Geneva, Switzerland, have lately completed a novel twenty-cylinder petrol engine; it has been designed for aeronautical purposes, and, while it is claimed to be able to develop 120 h.p., its weight is only 187 lbs.

THAT well-known motorist, Sir A. J. Macdonald, has recently patented a new device to prevent the side-slip of motor-omnibuses. Two arms or sprags connected together by tie-rods are pivoted to the vehicle frame behind the back axle, and are brought into contact with the ground by longitudinal rods operated by the driver, springs allowing for irregularities in the road surface. The device is normally held inoperative by springs.

SOME MOTORING TROUBLES AND HOW TO CURE THEM.

AMONG the useful odds and ends that should be included in the kit of an ordinary car should be some rubber insulating tape and a tube of tyre-stopping material, such as Pneu Cure or the Vulcan stopping. Recently I found my engine heating some six miles from anywhere, and on inspection discovered a hole in one of the water-circulating rubber connections. I had no spare rubber hose-pipe, but, the pipe having emptied itself of water, which it did before the defect was discovered, I was able to fill the hole up with the Vulcan stopping I had with me; and then, by painting rubber solution on the tube, the insulating tape was fixed for an inch above and below as well as over the stopped-up hole, and when the tank was filled up the water was retained. As a matter of fact, this temporarily repaired tube did service for over two weeks, and I do not think that I need have then replaced it.

There is no doubt that a tyre lasts much longer if cuts are

square with a small file, and then replaced and adjusted so that a good "buzz" is obtained with as light a contact as possible; heavy contact wastes electricity and causes burning. When adjusting it is important that the high-tension wire be connected to the sparking plug, otherwise the coil may be damaged by burning of the insulation. Short circuits are another source of worry. An easy method to detect these torts is to run the engine in the dark; a dull blue flicker soon shows where the leakage is, and then a little rubber tape will soon effect a cure.

In cleaning sparking plugs it is as well to recollect that it is not only the points that need attention, the insulating surface between the central electrode and the shell of the plug is, as a matter of fact, the common seat of offence; a layer of carbon in that position allows of short circuiting. A little petrol squirted up, and a wee bit of rag on a bonnet pin, should easily put matters right. Even though a plug sparks correctly at the points when earthed on the outside of the engine, it does not prove that it will do so when in the cylinder under compression, as then the added resistance may cause the current to pass through small defects in the insulation, which, when the path at the

A Group of Rover Cars on the occasion of the opening run of the Motor Cycling Club. The run was to the Old Ship at Brighton, and no fewer than fourteen privately owned Rovers took part in the event. The photograph was taken by Mr. R. H. Head, Chairman of the Motor Cycling Club.

stopped up as soon as discovered. Complaints are made that stopping does not always stay in. It will if the hole or cut is first cleaned out thoroughly, and fine emery paper is used. A little rubber solution should next be painted in the hole and allowed to dry, before the stopping is put in, a little at a time. I have some cuts that were filled in this way three months ago, and the stopping is still in and looks as if it would outlive the rest of the cover.

An ordinary cycle oil can with a long spout is of great use. It can be kept full of petrol and used to squirt petrol into the cylinders through the compression taps, when the engine is slow in starting, as is the case occasionally in cold weather. A few drops of petrol, too, on the platinum points of a magneto are of use for cleaning purposes. I picked this tip up from the driver of a motor-bus. Seemingly they all dose their magnetos with petrol when they "play up." It certainly cleans the contacts and is much less trouble than to dismantle the magneto, so as to get at the points and clean with a small file or emery paper. The same can be used for the points on the trembler of a high-tension coil. The burning of the platins on the trembler of an engine fired by high-tension coil ignition is probably the commonest of all causes of loss of power or stoppage. The screw and trembler blade can be removed, dressed perfectly

gap was easy, it would miss. The usual gap at the points should be about one-twentieth to one-sixteenth of an inch, and in the event of the accumulators being run down and others not procurable, it is possible to get the engine to run by approximating the points a little more.

Those having trouble with the leather ring of their pump-friction wheels will, I believe, find $\frac{3}{8}$ in. sheet fibre a good substitute. The fibre can be roughly cut round, fixed on the wheel, and then the wheel can be put on a mandrel, and the fibre periphery trued in the lathe.

Pre-ignition, a common source of overheating and loss of power, is frequently the result of too rich a mixture, and can, therefore, be avoided by seeing that the carburettor air inlet is sufficiently large and that the carburettor does not flood. Flooding of this member does not always mean that the needle valve wants grinding in; it is generally due to wear on some or all of the float bearings; a little wear on each of these will account for the petrol level being too high and so too rich a mixture. The cure is to tap the needle valve rod a shade lower, so that the valve shuts off a little sooner.

C. T. W. H.

CONTESTS between roller skates and motor-cycles are a new attraction at the Corn Exchange, Brighton.

GOSSIP FROM PARIS.

IN France there is no better soporific for an agitation of public opinion than the nomination of a Parliamentary or extra Parliamentary Commission of Inquiry. It is the means which every Cabinet, whether reactionary, republican, radical, or socialist, has had recourse to with success since the establishment of the third republic. M. Barthou, after conciliating the journalists by his speech at their banquet last week, has not failed to profit by the opportunity to complete the calming of the storm raised by his bill on motor-car traffic. An extra Parliamentary Commission of inquiry on the subject had been nominated some two years ago, but its very existence had been forgotten. The Minister had but to resuscitate it. That has been done by the addition to its members of numerous senators, deputies, members of the Automobile Club, motor-car makers, &c., and by the summoning of the Commission to resume its sittings. It has met again, but, as now it comprises over seventy members, the progress of the discussion will most surely be slow. At the same time the Parliamentary Committee to which M. Barthou's bill was referred for study has had several sittings. Deputations from the automobile manufacturers and from the workmen in their employ have been summoned to enlighten its members as to their real sentiments towards the proposed measure. They were so clearly expressed that M. Léon Janet, President of the Committee, thought it right to reassure both masters and men by declaring that the Barthou bill, when modified by the Committee, will further the interests of the motor-car industry and aid its development.

"ALL's well that ends well," but the end of this affair will be a long time coming. The Committee of the Chamber will surely want to know the result of the inquiry of the extra-parliamentary Commission before it completes the remodelling of M. Barthou's bill. And who will be rash enough to predict the date at which the report of that Commission will be presented to Government? In the meantime the petition against the outrageous stipulations contained in the draft bill sent by the Automobile Club to every town, village and hamlet in France is being signed not only by all connected with the automobile industry but by the owners of self-propelled vehicles, and by all those who profit directly or indirectly by the new means of locomotion—and their name is legion.

THE International Road Congress, which is to be held in Paris this autumn, will open its doors on October 11th. It is the historical Salle du Jeu de Paume, on the terrace of the Tuileries garden, which has been chosen for its sittings. Placed under the patronage of the President of the Republic and of the Ministers of the Interior, Public Works, and Foreign Affairs, it is expected that few countries will abstain from sending delegates to it, as the road question is becoming more and more important every day. The general regulations sent out with the invitations show that the main point which will occupy the attention of the Congress will be the effects of automobile traffic on the roads, and the most effectual means to render the highways capable to withstand the wear and tear to which they are subjected by the new means of locomotion. The dust question will also receive the attention of the Congress.

WITH the object of having reliable information to lay before the assembly, the Minister of Public Works has authorised the expenditure of some £40,000 in the examination of the national roads. The Ponts et Chaussées engineers are to cut trenches half way across all the main roads at comparatively short distances to ascertain exactly the condition of the materials employed. The reports they will send in to the Minister will also contain particulars concerning the traffic on those thoroughfares, &c. In this connection it is interesting to note that a proposal has been sent to the Organising Committee suggesting that the deliberations of the Congress should not be confined to the effects of the motor-car traffic on the highways, but should also comprise the effects of the different kinds of roads on automobiles, and especially on the tyres. The utility of the Congress will certainly be

enhanced by the International exhibition of drawings, models, materials, machinery, &c., used in the making and repairing of roads.

HAS the "Matin" made April fools of its readers? One might be almost inclined to think so by the telegram it published dated April 1st. It states that the 60-h.p. Thomas automobile driven by Mr. Brinker in the race round the world from New York to Paris had been shipped at Seattle for Alaska. Other telegrams received previously and subsequently, and one of which was published in the very serious "Journal des Debats," state that Mr. Brinker, having at Seattle ascertained that the condition of Alaska was such as to preclude the possibility of a motor-car crossing the country, had taken the very sensible resolution to ship his automobile to Vladivostok. This is all the more probably true because it was not necessary to go to Seattle to know the insurmountable obstacles which must be encountered by an automobile in the country in question. At any rate there are very few people who are at all acquainted with the geographical and climatic conditions of Alaska and the north of Siberia who imagined that the competitors in the race round the world could possibly drive their motor-cars from the southern point of Alaska to its northern extremity, and then, after crossing Behring Straits on a boat, continue the journey by skirting the Arctic coast of Siberia. The French are, however, proverbially 'bad geographers, and the general public fail to appreciate the vast difference existing between their country and the Arctic regions. The organisers of the race knew this very well when they decreed that the competitors must only ship their motor-cars from San Francisco to Alaska via Seattle and across Behring Straits. The great masses of the people in France took it for granted that the feat of completing the rest of the journey on land without using the railway would be achieved. And though Mr. Brinker's competitors will, if they are prudent, follow his example in shipping their motor-cars to Vladivostok, this little incident, and probably many others, will be ignored or forgotten when, at length, the victor reaches Paris.

IN the month of July Doctor Jean Charcot will leave France for a second voyage of exploration in the Antarctic regions. His journey will have a special interest for motorists, as he proposes to use petroleum motor sledges. He believes they will enable him to penetrate much farther south than he could possibly hope to do with sledges drawn by dogs. If only the auto-sledges do half so well in the Antarctic regions as they did during the trials recently made with them on the Lautaret Pass, there is good reason to expect success. At any rate, the experience of Captain Scott, who in 1901-1904 reached a point situated as far south as 82 deg. 17 min. south latitude, would seem to prove that it is dangerous to rely solely on dogs, for of the twenty-two he took out with him on the Discovery only three or four returned. Dr. Charcot's auto-sledge, which has a total weight of only 462 lb., comprises three distinct parts—the frame, the motor, and the propeller. The frame is made of ash, and is built on the Norwegian model. The 2½-h.p. motor, which is placed behind, is well protected from the snow. There are two speeds, the first two and a half miles an hour, and the second five miles an hour. The propeller is composed of one broad wheel with two rims, each of which is furnished with teeth destined to bite into the snow and ice. This propelling wheel is articulated in such a manner as to follow the sinuosities of the ground. With the aid of some Alpine soldiers and his mechanician, M. Pelissier, Dr. Charcot ascended and descended several steep hills at the rate of five miles an hour. The stability of the sledge was remarkable, and the result of the trials was in every way encouraging.

MARNEY.

THE partnership hitherto subsisting between Messrs. J. Walter Sully, Roland J. Sully, and Mr. E. Hopkins has been dissolved by mutual consent so far as regards the latter gentleman, who retires from the firm. The motor business will be continued at 43A, Penarth Road, Cardiff, by Messrs. J. W. and R. J. Sully, whose garage is well known to motoring visitors to the Welsh town.

A RUN INTO HAMPSHIRE.

(Concluded from page 118.)

THE direct south road to Basingstoke should be taken; it is typical of what the Americans like to describe England as, namely, a well-tilled garden, small fields, with hedges and little streams trickling through pasture fields. A turning near to Sherborne St. John leads to that beautiful old place called "The Vine." Originally built in the early part of the sixteenth century by Lord Sandys, it was greatly improved by Inigo Jones. It is a long-fronted

The Castle Gateway, Old Basing.

brick building, with what Walpole styled "The most heavenly chapel in the world." In the ante-chapel is a "Last Supper," by Ferretti. The stalls are richly carved, and the stained glass windows were brought from Bologna in 1544. The old alms box is worthy of note. The church of Sherborne St. John has a plain Norman doorway, over which are effigies of the builders. In the aisle is a bookstand, with some chained books. Instead of keeping on the main Basingstoke road, a turning to the left can be taken to Old Basing, on the Lodden. It is a quaint old red brick village, made picturesque by the grey feathery headed reeds in the stream and the old mill. The ruins of the castle should be seen; the gatehouse covered with ivy still remains, and over the gateway, cut in stone, are the arms of the Powletts, three swords in pale, points in base. With a little imagination one can go back to 1643; then a stately mansion stood where but a ruin now exists, a palace which once received and entertained Queen Elizabeth; not that there is much in that, as, seemingly, few old houses exist which did not receive that gay queen. Here the Royalists gathered, surrounded by a brick rampart lined with earth and a deep trench, and guarded by the lofty Gate House with its four turrets looking northwards. Here Colonel Norton and Colonel Harvey are beaten off, and forced to retreat to Farnham. The Parliamentarians return with grenades and culverins, but still the Marquess loftily refuses to surrender. On drags the siege, until at last great Cromwell comes with regiments of horse and foot, and, having battered down portions of the wall over-night, rushes in, and like a fire-flood takes the place by storm, even killing the brave daughter of Dr. Griffith, who upbraided the Roundheads for their rough treatment of her father. What stirring scenes took place in those desperate days at Old Basing—work for tears in many an English mother, whose sons were scattered on that bleeding ground, coldly embracing the discoloured earth. Even recently, when the Basingstoke canal was cut, swords, cannon balls, and skeletons and such fragments of this great siege were found. Near is an ancient Danish entrenchment—the Winklebury Circle—and as this overlooked the town it was used by Cromwell as a surveying station prior to the attack.

Basingstoke itself is an unattractive-looking town, once famous for its silk and woollen trade. As we had to halt for that usual worry of a motorist—a flat tyre—we wandered to the

ruins of the Holy Ghost Chapel. Only a hexagonal tower and a few walls remain. The head-master of the Grammar School bears the title of Chaplain of the Chapel of the Holy Ghost. Gilbert White, while a boy at this school, admits having undermined and investigated much of the ruins; whether with the approval of the chaplain or not is not mentioned. The main road, which, however, we found very stony, leads by Kempshot House, Popham, East Stratton Park, Itchen Wood, and Kingsworthy, to Winchester. Hackwood Park, which is to the left of the main road, is worthy of a visit. In front of the house is an equestrian statue of George I., and the Hall contains some fine carvings by Gibbons. Spring Wood suggests a tropical forest; the ivy has grown unchecked, and hangs from the beech trees in long festoons, so that it is easy to imagine oneself in the bush of some Fiji island, miles from civilisation; all that is wanted to complete the illusion is a few palms with more or less naked natives climbing them. Near, bounded by a wall of elms, and with a stage of turf, is a grand amphitheatre. Here Lavinia Fenton, the original Polly Peachum of the Beggars' Opera, performed. She it was who married the third Duke of Bolton. The park is very picturesque, and contains some ancient white-thorns. Instead of returning to the direct route the road to Alton can be followed by Winslade and the well-timbered park of Herriard to Lasbam; here a pretty turning to the right wanders by Medsted and Bighton to New Alresford. At Medsted there is a fine Norman church containing an alabaster monument of William Wallop, in armour. The authoress of "Our Village," Miss Mitford, was born at New Alresford; the village, of course, is Grazeley, not far from Mortimer and Eversley. If a visit is paid to the church at New Alresford the curious old crucifix in the west tower should be looked for.

The direct south road leads to Tichborne, which, as a result of the historic trial that took place in 1872, is well known to the public. One can quite understand anyone claiming this beautiful place. Orton, who was ultimately convicted of perjury, gave out that he was the eleventh baronet, Roger Tichborne, said to have been lost at sea. The claim let the estate in for some £80,000 law costs. Having wandered off the main track, we continued 1½ miles south to Cheriton, famous for the battle in which the Royalists under Lord Hopton were routed by Waller's Parliamentary soldiers; now this village is chiefly famous for its truffles. If time permits, the Early English church should be

The Deanery, Winchester.

seen, especially the ancient tiles on the altar platform. From here the road on the right should be followed and the second turning also on the right taken, and so Winchester can be entered without descending the precipitous hill on the more direct route. We were not sorry to reach that comfortable inn "The George," and, after our prolonged run, did excellent justice to the good fare there provided; the car, too, received her food in the shape of petrol and oil—in fact, we found the town so interesting that we stayed the night.

This old capital of Wessex contains much to warrant a close inspection. Here, where King Alfred's statue has been erected,

did he with his friend of weather fame, St. Swithin, hold his Court; here Guy Earl of Warwick, and Colbrand, the Danish champion, did in single combat settle the issue; here William the Conqueror, Stephen, and Richard I. were crowned; to this town, up to Henry, the many-wived king, flocked merchants from all over Europe to buy the cloth that then was made there; and now it is famous for its cathedral and school. At the bottom of the hill, close to the bank of the Itchen, is the old cathedral, probably the longest in England. Entering by the west door the general appearance is most impressive. On either side are statues of James I. and Charles I., and though the balcony which serves for a triforium is very light it adds to the general effect. The tribune, as the square stone gallery at the end of the north aisle is called, should be seen; once it harboured minstrels, now the episcopal registers. Other interesting features are the chantry of William of Wykeham, the memorial slab to Jane Austen, the novelist, and the alleged tomb of William Rufus. This is in the centre of the choir, a plain sarcophagus, and it is claimed that it is the original place of interment. As this was questioned, some forty years ago it was opened and a body, or portions of one, was found with bits of a gold thread embroidered

King Alfred's Statue, Winchester.

red cloak, and fragments of wood and iron that together made an implement a yard long, and is said to be the fatal arrow. The screen was renovated in 1891, and is a marvellous piece of work; the spandrels of the doors representing the Annunciation and the Visitation are of interest. The wall paintings, illustrative of the Passion and the martyrdom of Thomas of Canterbury, in the chapel of the Holy Sepulchre, deserve notice. In the South Chapel Queen Mary married Philip of Spain in 1554, and there is still preserved the faldstool used by her on that occasion. Leaving by the south door the Deanery is approached; here it was that Charles II. lodged while watching the progress of his own palace on the hill, but the then prebendary, Ken by name, refused to admit Nell Gwynne to his house. Seemingly the King bore him no ill-will, as he afterwards made him Bishop of Bath and Wells. Leaving the Deanery and passing St. Swithin's Church College Street is entered; on a house on the right may be noted a tablet in memory of Jane Austen. The college is famous, and among its pupils may be mentioned Wordsworth, Anthony Trollope, Dr. Arnold, Lord Northbrook, as well as many others. In old days the boys had their meat off wooden trenchers, but now plates are provided. In the hall there still exists the "tub" in which the broken meat is placed after dinner. In the good old times the scholars' beds consisted of

but a bundle of straw with a coverlet, and even in these more hygienic days clean sheets are called "clean straw." The play ground is known as the "Meads," and the marks on the old gate are stated to be due to the shot of Oliver Cromwell.

Winchester gives one such a feeling of serene peace, dropping down, as it seems to, from the barracks and County Hall on the steep to the old grey cathedral surrounded by its beautiful red brick deanery buildings on the flat, with little bits of green lawn scattered about and then the Stoke bridge, where St. Swithin built his bridge over a thousand years ago, and as one leans over it is so easy to dream of when motors were not, and of that period of which Kingsley wrote in "Hereward the Wake," when the last of the English came with his forty knights to see King William at Venta Belgarum, "It's the same river Itchen that roared then as it does now." CHARLES T. W. HIRSCH.

SOME USEFUL NOTES.

BEFORE attempting to remove any part of the mechanism of a car the exact construction and object of the same should be thoroughly understood. Furthermore, before any part is removed be sure that you can replace it correctly, even after a considerable lapse of time.

EVERY shaft or other part of a motor-car which revolves in bearings should be found to move with perfect freedom after the bearings are adjusted; it is far better to leave bearings slightly too loose than too tight.

THE cars of eight or nine years ago were somewhat prone to develop an immense amount of rattle through the loosening upon their studs, pins, or pivots of such parts as radius rods, steering connections, and brake operating rods. It is now the general custom to use hardened pins and bushes very largely in such parts, to provide grease-cup lubrication or some equivalent dust-excluding means, and to furnish means of adjustment when looseness finally develops. The result is that the modern car may be kept free from annoying rattle for years at slight trouble and expense.

ON almost all old cars and on some of the newer ones there are to be found parts which are intended to be lubricated by oil squirted from a can into an open, counter-sunk oil hole. Everyone knows that usually rather more grit than oil gets into these holes in practice. It is a good plan to fit such parts with small lubricators as used on bicycles, and so remove the possibility of the entrance of dirt into the oil holes, and at the same time afford good lubrication.

IT is an easy matter, in an ordinary private motor stable, when taking down any portion of the mechanism, to lose some of the small parts, such as nuts and screws, unless precautions are taken, and it is advisable to have on hand a number of small boxes into which the small pieces from each part of the machine may be sorted. It is specially worth while to do this where some time may elapse before the mechanism is again to be put together. Some motorists provide a number of tin cans partly filled with paraffin, into which such parts may be sorted when removed. These parts, which are generally dirty or gummed with oil, are thus cleaned by the time they are required.

IF a repaired motor tyre is to prove satisfactory, the work it is required to do should be proportionate to the services it is capable of rendering. Consequently such tyres should be placed on front wheels. Having less strain to bear, the cover will last longer; it will be less exposed to punctures and, consequently, will be less liable to burst. Being placed in front, it can also be watched more easily. Repaired inner tubes can be used in the same way; those that have been repaired should be kept for the front wheels, where the strain is not so great, and, consequently, the heat is less, and they will be able to resist some time longer, whereas they might be unfit for use after the first mile if they are placed on the rear wheels.

AN auction sale of motor-cars was conducted at Dundee on Friday of last week.

THE new concern, Benz Motors, who have just opened a depot at Portland Court, Great Portland Street, London, W., are keeping a stock of spare parts for all types of Benz cars.

ON the premises of Messrs. R. Woodhead, of Southport, on Monday, the R.A.C. held an examination in driving and mechanical proficiency.

A FEW catalogues of the Cordingley Show remain from the Exhibition, and will be sent to any address on receipt of the published price, 6d., plus 3d. for postage.

IN the Carshalton Road, Sutton, Mr. R. G. Jeffries is opening an establishment for the storage and repair of cars. He will undertake contracts to keep automobiles in running order, and will also carry a large stock of accessories, oils, &c.

THE Right Hon. the Earl of Leven and Melville has placed a further order with the Daimler Company for a 42-h.p. "Hazelwood" car. An order has also been received from Sir Samuel Scott, Bart., M.P., for a 42-h.p. Daimler with "Frome" limousine body.

DURING the present week Messrs. G. H. Cox and Co. have held an interesting motor show in the Empress Hall, Southsea, the exhibition comprising a full display of Argyll and Fiat cars, as well as a range of Dunlop, Continental and Palmer Cord tyres and other accessories.

AT the last meeting of the Metropolitan Asylums Board, Mr. J. T. Helby said that in one day the motor ambulance with two men and one nurse had done work which, under the old conditions, would have required five horsed vehicles, nine horses, six men, and five nurses.

BY request of the Dublin County Council the Local Government Board is to be requested to prohibit motoring on the road from Malahide to Portmarnock via the Velvet Strand. Should this be accepted it will put an end to the interesting motor competitions that have taken place there.

A MOTOR-CAR containing three occupants was proceeding along the High Road, Woodford, on Saturday, when it caught alight. The passengers were so severely burnt that they had to be removed to the hospital. A fire engine arrived on the scene promptly, but the car had by that time been almost entirely destroyed.

ACCORDING to the "Motor News" the Kempshall Tyre Company report that they are quite satisfied at the amount of business done at the Agricultural Hall Exhibition. So brisk were their orders that they had to remove half the tyres off the stand during the progress of the Show for despatch to clamouring customers.

A NOVEL puncture-proof band for motor tyres was shown on the stand of the Gaggenau Motor Vehicles Company, of 95, Regent Street, W., at Olympia last week. The band, which is known as the "J. D.," consists of a series of short pieces of cane, semi-circular in section, held in pockets attached to a thin strip of leather; the band is solutioned to the inside of the outer cover, and is stated to have proved extremely efficacious in preventing punctures.

THE National Motor Academy and Exchange, Ltd., of Boundary Road, Notting Hill, W., have sent us a copy of a working model of a petrol engine they have just issued. This is an extremely interesting production, as the action of a four-cycle engine is by its means very clearly demonstrated. On one side of the model there is a general view of the engine with the half-time gear exposed, showing how it is also utilised, on one side, to drive the water circulating pump, and on the other a magneto. The reverse side of the model gives a sectional view of the motor, and shows how the reciprocating motion of the piston is converted in a rotary motion of the crank-shaft, and also the method of operating the inlet and exhaust valves. Altogether the model is a very useful production and demonstrates the complete manner in which the National Academy have taken up the motor tuition question.

THE Danish Touring Club is organising an international congress for the discussion of touring matters, to be held in Copenhagen in 1909.

MR. ALFRED RICE, of the East Grinstead Carriage Factory,

in the London Road of that Sussex town, is giving attention to the building of motor-car bodies.

PRINCESS VICTORIA OF SCHLESWIG-HOLSTEIN, who is at present paying a lengthy visit to Ireland, will, during her stay, do a good deal of motoring through the country.

AT a political meeting at Nutley, Sussex, the prospective Unionist candidate (Mr. H. S. Cautley) was asked if he would be in favour of the swine fever regulations being applied to "road hogs."

TURNER'S AUTOMOBILE WORKS, LTD., have a garage at the Carriage Companies' Buildings, Rusholme, Manchester, where the repair of cars is undertaken, accumulators charged, and automobile sundries generally supplied.

MESSRS. OLLIFF'S Motor Depot is about to open another garage in Middlesbrough in addition to that they already have in the Corporation Road. The new premises are in the Grange Road, and will be under the supervision of Mr. J. Nesham.

The Lever Spring Suspension as fitted to the rear springs of a car.
(See page 120 last issue.)

A WARNER autometer is under the observation of the R.A.C. on the Siddeley car on which the 3,000 miles trial of the Elastest filled tyres and Elastest movable flange rims is now in progress. Non-stop runs were made on the first five days of the event, the mileage being 760.

MR. T. H. D. BERRIDGE, M.P., speaking at Coventry the other day, said he wished to refer to the possibility of taxation of motor-cars by the Chancellor of the Exchequer, who, he had reason to believe, and cause to hope, had found the difficulty of fixing a basis so great that he might have to pass the matter by altogether.

THE annual motor-boat race meeting at Monaco is being held this week. The principal event on Monday was the fifty kilometres race, open to all racers without distinction. Five boats started, the result being a win for the Wolseley-Siddeley, in 56 min. 17 2-5 sec., the Panhard-Levassor being second, and Jeannette third.

THE improved Cape cart hood designed by Mr. T. D. Brock, St. Mary's Road, Ealing, W., is operated by merely raising a lever whilst on either side of, or inside, the car. The hood is thus automatically extended to its proper position without sagging of the sticks or damage to the body. The hood is being made by Fountain's Coach and Motor Company, Ltd., of Ealing, by whom it was exhibited at the Cordingley Show.

LORD and Lady Newborough, who have been at Cannes for some weeks, have gone for a motor tour to Pau and Biarritz.

At Pontypool, Mr. J. E. Woolley is opening a motor garage, and in addition to a repairing shop will also develop a department for instruction in motor-car driving.

An International School of Aeronautics has lately been established in New York City. The courses, which are arranged for home study, consist of lessons, accompanied by nearly 300 figures, diagrams and charts on separate plates. There are offered three courses, first, covering spherical balloons; second, dirigible balloons; third, heavier-than-air machines.

HER SERENE HIGHNESS the Infanta Dona Eulalia has granted Mr. Rowland Winn the title of purveyor to her royal household, with the use of her coat of arms on the invoices and labels in connection with his motor garage in Albion Street, Leeds. Mr. Winn was a pioneer motorist in Yorkshire, and we congratulate him upon the distinction conferred on him.

We illustrate herewith the useful pedal guard which has lately been put on the market by the Nonex Safety Tank Syndicate, Ltd., of 46, Dover Street, London, W. As will be seen, it consists of two light frames, which may be covered with patent leather or other suitable material. The frames are connected at their lower ends to a spindle carried by bearings

mounted on the footboard. Means are provided for adjusting the guard to any required angle. The device, which can be fitted to any car, not only acts in keeping off draughts from the feet, but in cold weather, as the illustration shows, permits the driver to make use of an apron or rug without any fear of the latter fouling the clutch and brake pedals.

THE date for closing the list of applicants for the Daimler Engineering Scholarships was originally fixed for March 31st, 1908, but enquiries for information and forms of application are so numerous that, apparently, there are many eligible for the examination who have not learnt of the scheme in time to make application. It has been decided, therefore, to extend the date of closing the list of applicants to April 30th, 1908.

IN view of the importance attaching to the results of motor-racing on their track, the Brooklands Automobile Racing Club have decided to appoint an official measurer and inspecting engineer, whose duties will be to see that the technical requirements of the rules and regulations are strictly complied with. For this purpose the club has retained the services of Mr. H. Waymouth Prance, A.I.E.E., A.M.I.A.E., whose extensive experience in car inspection work renders him particularly fitted for the appointment. Mr. Waymouth Prance will be in attendance at all race meetings on the track.

MESSRS. A. and C. Bridgland, Limited, of 33 and 35, London Road, East Grinstead, have a motor garage, where they stock motor accessories, petrol, &c.

AN inquiry has been received by the Automobile Co-operative Association, Ltd., for illustrated catalogues of small motor-cars suitable for the colony of N.Z.

THE Canada Cycle and Motor Company, of Toronto Junction, Ontario, has secured a contract from the General Post Office Department of the New Zealand Government for an 18-h.p. motor-van to be used in collecting the mails.

THE Arcade Motor Garage, Limited, has transformed one of the arcades in Aberdeen into a garage and showrooms for motor-cars. This is situated at that end of Union Street, Aberdeen, by which motorists from the south enter the city. Facilities for repair work are being set up.

SIR FREDERICK POLLOCK has written to the Westminster City Council calling attention to the amount of depreciation which was resulting from the motor-buses running in Bayswater Road. He states that his house is one of a block of six red brick houses erected eight or nine years ago. In consequence of the noise and vibration only three of the houses have found private purchasers. The plaster is cracked in every room, and the vibration of the walls, floors, and windows has become very serious.

CAPTAIN WINDHAM, the King's Messenger, who has been carrying momentous despatches between the King at Biarritz and his advisers in London, is a well-known motorist. For the first time in our history a taximeter cab has been employed to carry messages from the King to the incoming Premier, the Messenger arriving at Charing Cross on Monday and going to the Treasury in such a vehicle. When he found Mr. Asquith was not there he at once re-entered his motor-cab and went to Cavendish Square, W., with his message from his Majesty.

FROM Messrs. Chapman and Hall, Ltd., comes a copy of the first edition of the Sporting and Athletic Register for 1908. Within the 680 pages of which the book consists are given the records of all the important events in athletic games and every form of sport in the United Kingdom last year. Half a dozen pages are devoted to motoring, the results of trials and races both in this country and abroad being given. Every care seems to have been taken in the compilation of this annual publication, which will have considerable interest for sportsmen of every description.

THE Canterbury Automobile Association, which promoted the New Zealand Reliability Trial, has issued a statement of the results. In Class A, for cars of 12-h.p. and over, an 18-24-h.p. Siddeley and a 15-h.p. Talbot each secured first prizes, scoring full marks, and the second prize was obtained by a 15-h.p. vehicle of the latter make, which was one mark behind. In Class B the 10-h.p. Cadillac scored full marks and won the first prize; in Class C the 12-16-h.p. Clement-Talbot and the 15-h.p. Talbot each gained the maximum marks and tied for first prize, the 16-20-h.p. Argyll gaining the second prize, and being only four marks behind. Class D, for the cars of private owners, under 12-h.p., was won by the 8-h.p. Reo.

IN view of the near approach of the holiday season the Car Mart, Ltd., wisely take advantage of the present appropriate time to participate in the exchange of automobiles usually associated with this period of the year. Its establishment is at 279 and 299, Euston Road, N.W., and also at 72-73, Warren Street, London, W., the area being nearly 30,000 square feet, and so conveniently devised for the purpose of selling motor-cars that the vehicles can be inspected by natural light, as compared with the artificial illuminants by which cars are often examined. The system of business that is distinctive of the operations of the Car Mart, Ltd., consists in the second-hand cars being accompanied by a written expert report, so that the possible purchaser is provided with useful knowledge with regard to the automobile on offer. Special facilities are offered for the disposal of old cars taken by trading firms in part payment for new vehicles, and evidently the firm is well prepared to assist both the buyer and seller of vehicles that have already seen service, but which are good for further terms of usefulness.

CONTINENTAL NOTES.

The Elastic Wheel and Tyre Competition.

The annual spring and elastic wheel and tyre competition organised by the "Auto," of Paris, commenced on Tuesday, the 7th inst., and will extend to the 17th inst. The trial consists of a run to Nice and back, a total of 2,100 kilometres, and comprises eight daily trips of from 200 to 326 kilometres, two days being devoted to an exhibition at Nice, the final day being similarly spent in Paris. The vehicles to which the wheels are fitted are divided into five categories as follows:—Class 1, single-cylinder vehicles up to 100 mm. bore; two-cylinder ditto up to 80 mm. bore, and four-cylinder ditto up to 65 mm. Class 2, four-cylinder cars up to 85 mm. bore. Class 3, ditto up to 100 mm., and six-cylinder vehicles up to 85 mm. Class 4, four-cylinder cars up to 125 mm. bore and six-cylinder ditto up to 105 mm. Class 5, four-cylinder vehicles over 125 mm., and six-cylinder ditto over 105 mm. The minimum weight of the cars in running order, and including passengers in the different classes, must be respectively 750 kilog., 1,000 kilog., 1,250 kilog., 1,500 kilog., and 1,750 kilog. The rules provide that shock absorbers must not be used in conjunction with the springs. Each class is divided into two sections:—(a) In which no repairs and replacements of wheels or tyres can be made, and (b) in which they will be permitted in those cases where the reservation has been provided for in the entry form. Forty-two entries were received, but of these only the following twenty-one put in an appearance on the weighing-in day:—

| Tyre or Wheel. | Car. | Weight of Vehicle. kilog. |
|---------------------|-----------------------|---------------------------|
| Ducable ... | Delage ... | 900 |
| Metallo-Elastic ... | Le Metais ... | 843 |
| Sider ... | Aleyon ... | 830 |
| Spiro-Flexible ... | Renault ... | 798 |
| Ducable ... | Vulpes ... | 1,238 |
| Sider ... | Darracq ... | 1,100 |
| Touzelet ... | Ours ... | 1,510 |
| Ideale ... | Brasier ... | — |
| Lynton ... | Gregoire ... | 1,343 |
| Metallo-Elastic ... | Werner ... | 1,160 |
| Ducable ... | Mors ... | 1,470 |
| Gautier ... | Renault ... | 1,635 |
| M. Y. G. ... | Mors ... | 1,976 |
| Sider ... | Rebour ... | 1,197 |
| Ducable ... | De Dion-Bouton ... | 1,975 |
| Metallo-Elastic ... | Darracq ... | 1,823 |
| M. Y. G. ... | Darracq ... | 2,312 |
| Delta ... | Lorraine-Dietrich ... | 2,195 |
| Sider ... | Rebour ... | 1,570 |
| Ducable ... | Motobloc ... | 1,770 |
| M. Y. G. ... | Peugeot ... | 2,446 |

French Motor-Car Exports.

Judging from the returns for the first two months of the current year, the exportation of motor-cars and motor parts from France is experiencing a considerable set back. During the period named the shipments only attained a value of £693,920, as contrasted with £908,960 in the first two months of 1907, and £1,137,360 in the corresponding period of 1906. With the exception of the United States, Russia and Spain, every market shows a decline, the shipments to the United Kingdom having fallen from £368,880 to £286,600.

The Prince Henry Tour.

Several alterations in the conditions of the Prince Henry Tour, which is to be held from June 9th to June 17th, have been made, and the daily stages are in various instances either to be shortened or the route carried through different districts from those originally determined on. As now fixed the first day's run is from Berlin to Stettin; on June 10th, to Kiel; June 11th, rest in Kiel; June 12th, run to Hamburg, a speed trial being held en route between Rendsburg and Itzehoe; June 13th, exhibition in Hamburg; June 14th, run to Hanover; June 15th, to Cologne; June 16th, to Trier; and June 17th, to Frankfort-am-Main, where the tour will end. It has been decided to hold the hill-climb at Bacharach on the last day, and the formula for this event will be prepared immediately. In

order to prevent any racing during the event the authorities have decided that all the competing vehicles must be fitted with speed indicators. Entries close on the 15th inst. instead of the 1st inst. owing to the above-mentioned alterations. In reply to a question, the German Club states that the Rudge-Whitworth detachable rim is admissible, changing of rims being marked with one-tenth of a point, as well as each change of an outer cover or repair to the same.

Motor Racing in Italy.

A motor-car race was held on Sunday last on the Padua-Bovolenta road by the Automobile Club of Venice. The contest was over a distance of 10 kilometres, which had to be covered in both directions, classification being based on the averages of the two runs. The best time of the day was made by Trucco on an Isotta Fraschini (4 min. 53 sec.). The meeting was unfortunately marred by a serious accident. An 120-h.p. Itala, driven by the Count dal Torso, swerving to avoid another car travelling in the opposite direction, ran into the spectators assembled by the side of the road, killing one person and seriously injuring six others.

Miscellaneous Items.

An Aries 14-18-h.p. car recently made a very successful run from Paris to Prague, a distance of 745 miles. The French

The 24-h.p. De Dion Motor Van recently put in service in Sofia by the Bulgarian Post Office Authorities.

capital was left in the very early hours of a Saturday morning, and Prague was reached on the Sunday afternoon. The car carried its full complement of passengers and luggage.—An aero section has just been organised in connection with the Austrian Automobile Club.—The Northern Railway Company of France have lately put in service in Paris a special Brouhot car for the conveyance of passengers and their luggage to or from the Gare du Nord.—Seven new public motor-car services are about to be started in different parts of Bavaria by the Government of that country.—A motor gymkhana is to be held in Munich on July 20th, during the sporting exhibition to be held in the Bavarian capital this season.—The date of the Austrian Automobile Club's tour through Bosnia, Dalmatia and Herzegovina has been altered to May 3-14.—The Crown Princess Olga Alexandrowna, the sister of the Czar, has just ordered an N.A.G. car.—The Antwerp Automobile Club held an interesting reliability trial on Sunday last, victory falling to the Germain car driven by M. Perpere.—A hill-climbing competition was held on a two-kilometre course on the Bormes Hill, near Toulon, on Sunday last. The best time of the day—2 min. 5 sec.—was made by M. Hallut on a Mors.

The Cordingley Motor Show.

(Continued from page 129.)

THIS week we continue our reference to the exhibits at the recent Cordingley Show at the Agricultural Hall, London. From the following particulars, as well as from the descriptions which have already appeared, it will be gathered that the Exhibition was of an interesting character, the many new chassis on view being supplemented by a varied display of novel motor accessories.

Electrical Vehicles.

A novelty at the stand of the **ELECTRIC VEHICLE COMPANY, LTD.**, Earl Street, Westminster, S.W., was an electric parcel-carrier tricycle (Fig. 57). This is designed to carry loads up to 2 cwt. The motor

Fig. 56.—The Electrical Vehicle Company's Two Ton Van.

is supported at about the centre of the frame, and drives the rear wheel through a propeller shaft and bevel gear. A two-ton van was also on view. This is equipped with a battery of forty-two Tudor cells, having a capacity of 260 amp.-hours, sufficient to run the vehicle a distance of forty-five miles on one charge. The motor is supported at about the centre of the frame, and drives a differential shaft through spur gearing, the final transmission being by side chains. The controller is adapted to give six speeds forward and two reverse. This vehicle has during the past twelve months run a distance of about 14,000 miles in demonstration work. The batteries are supplied by the Tudor Company under a maintenance contract. Another commercial vehicle was one designed for loads from 20 cwt. to 30 cwt. In this the motor is located in the forepart of the frame, and is connected by a silent chain to one end of a cardan shaft, which in turn drives the rear axle through bevel gearing. The battery comprises forty cells, one charge being equal to a running distance of forty miles. A smaller vehicle on similar lines, to carry 5 cwt., was also on view. The pleasure vehicles, in which the motive power is supplied by electricity, comprised a landaulet with motor at front and cardan-shaft drive, and a neat little two-seated park phaeton with hood. The electric motor in this case is located about the centre of the frame, and drives the differential shaft by a silent chain, the final transmission being by two side chains. The battery, which consists of forty-two cells, is carried half at the back and half at the rear, the capacity being sufficient for a run of sixty miles on one charge. The controller is arranged to give six speeds forward and two reverse, the device being fitted with a "gate," which prevents the reverse being inadvertently put in.

The Kempshall Tyre.

Great interest is being taken in motoring circles in the performances of the Kempshall tyres, which are being placed on the market by the **KEMPSTALL TYRE COMPANY OF EUROPE, LTD.**, whose offices are at 1, Trafalgar Buildings, Northumberland Avenue, London, W.C. These are designed to overcome the side-slip problem, but vary from others before the automobile world in the fact that no metallic studs are used. In a recent issue we referred to the distinctive feature of the tyre, in which a series of rounded indentations serves to secure a good grip of the road surface and withstand any tendency to skid. A user who has

travelled over 1,200 miles on these tyres during the past winter reports that they show practically no signs of wear, while their non-skidding properties have been well proved. He purposely and repeatedly tried to get a good skid from them by going fast over greasy sets and jamming on the brakes, but failed every time.

Turner's Improved Tyre.

In the Inventors' Section of the Exhibition was a wheel demonstrating an improvement in pneumatic tyres for motor-cars and similar vehicles. In this the tyre, instead of being a continuous band around the rim of the wheel, is in the form of short sections, which the inventors, Messrs. **TURNER BROS.**, 39, Kempster Street, Lower Broughton, Manchester, assert, have a tendency to grip the road and so prevent the side-slipping too frequently associated with automobiles. Each section of the tyre is secured to the rim by a clip, with the result that the whole device is light and secure. One point of interest is, of course, that punctures can be easily located, and the necessary repairs carried out without hindrance, from the form of construction of the tyre.

Martin's Dust Suppressor.

MR. G. F. MARTIN, of Eastleigh, took advantage of the Show to draw attention to his device for suppressing the dust and mud scattered broadcast by the rapid movement of the wheels of motor-cars. Mr. Martin provides the road wheels with metal coverings which reach almost to the ground; by means of hinged flaps that can be regulated it is intended to keep the under portions of the car comparatively clean. Brushes are fixed close to the tyres just behind the point where they touch the ground, so that the dust and mud are not allowed to rise more than a few inches. The inventor estimates that his arrangement can be fitted to a car for a very small sum, so that it would not be a costly matter to give it a practical test.

Messrs. Nickells' Specialities.

In the Gallery, Messrs. **F. S. NICKELLS AND CO.**, of 2, Dornberg Road, Blackheath, London, S.E., were again to the fore with a miscellaneous exhibit of patent terminals, tubeless bicycle connectors,

Fig. 57.—The Electrical Vehicle Company's Electric Parcel Carrier Tricycle.

Universal connectors to fit the valve of any motor-car or motor-cycle, deadbeat-reading tyre tester and compression tester, and other specialities of ingenious design. The Universal self-sealing connector brought out by this firm is a simple and ingenious device the value of which has been previously pointed out in our columns. No reference to this stand would be complete without mention of Nickells' patent rear tell-tale lamp, which will save the motorist from fines and the accompanying endorsement of licences.

Wheels, &c.

Messrs. SMITH, PARFREY AND CO., LTD., of the Pimlico Wheel and Motor Works, Fulham Palace Road, Hammersmith, London, W., had a large and representative display of their wheels for cars of every description, from those for large lorries down to those for cars of small degree. Artillery motor-wheels for delivery vans, for 'buses, and for pleasure cars occupied considerable space. In addition, the firm had a large collection of front axles and forgings for the various parts of automobiles, and also showed repaired cylinders and water-jackets. A section of the available space was devoted to bentwood goods, to wings for automobiles, and similar productions, in which Messrs. Smith, Parfrey and Co.'s wide range is well known. Messrs. Smith, Parfrey

Fig. 58.—The Foden Steam Wagon. (See issue March 21st)

and Co., Ltd., are also interested in the A.P.S. shock absorber, the use of which reduces wear on tyres and engine alike. This leaves the action of the springs entirely free, and considerably eases the task of driving. The device regulates itself automatically during the first hundred yards of running to an air-pressure in the cylinder of from 50 lbs. to 60 lbs. per square inch, gradually increasing to 125 lbs. to 140 lbs. per square inch, according to the speed and road surface. Those interested in this type of absorber, and who did not attend the Show, can obtain full particulars from Messrs. Smith, Parfrey and Co., Ltd.

Lighting Motor Vehicles.

On the stand of Messrs. S. SMITH AND SON, LTD., we noticed a demonstration of the Leitner ignition and lighting system for motor vehicles. This is, in reality, a modification of Mr. H. Leitner's train-lighting equipment made suitable for road vehicles. A small dynamo, giving constant voltage over a good range of speed, is driven by gearing from the engine, and furnishes current to the cells. The dynamo not only keeps the ignition at its maximum efficiency, but, in conjunction with the ignition battery, provides sufficient current for the complete lighting of the vehicle, as well as for magnetic clutches or other electrical devices which may be required. The system has worked well in one of the motor-buses of the L.G.O. Company, and its extension to public-service vehicles generally would prove a boon to the travelling public.

The "Belmont" Non-skid.

A non-skid without studded treads was the feature of the exhibit of the "Belmont" non-skid shown by the company of that name, whose headquarters are at 15, Seething Lane, London, E.C. A band of a special fibrous material surrounds the cover in place of the usual strip of leather. This is constructed in such a way that it does not fray or shrink, and wears evenly and well. Age does not impair its efficiency, nor will it deteriorate by wet, while its suitability for all climates seems to have been satisfactorily demonstrated. The outer surface hardens with wear, and becomes more difficult to penetrate, while the gripping effect grows even more noticeable. Small stones or nails which become embedded in the material increase its non-skidding properties. The "Belmont" non-skid is guaranteed for 2,000 miles, and deserves a general test by motorists during the coming season.

The Motewood Exhibits.

The central feature of the display of the MOTEWOOD COMPANY, of Edmonton, consisted in a detachable wheel that is suggestive of strength, simplicity, and sustained service. One side of the rim is detachable, and is attached by being fitted into side pieces placed at an angle, so that when attached they are not likely to come off. Further attachment is also given, which is removable by a lever, and the device is freer than most from any loose pieces, bolts, &c. Another speciality shown by the company were the patent extension ladders for garages, &c., and also for reaching brougham tops, &c., in order to place luggage, &c., thereon without running any risk of scratching

the paintwork. The ladder has a channel steel liner running its entire length. This is strained to a high tension, and enables the use of very light timber, an advantage in connection with automobile use, to which we suggest it can be readily put.

Hoods and Accessories.

A large and representative display of the various sections of their automobile business was made by Messrs. S. SWAN AND CO., 212-216 and 228, Pentonville Road, King's Cross, London, N. In addition to cars, the firm showed a large selection of Cape-cart hoods, including side-entrance hoods complete with side curtains and the necessary fittings, and a remarkably cheap hood for two-seated vehicles. The Swan folding wind-screen was also on view. Several sets of new tyres were shown, and some lines in accumulators and coils attracted many buyers. Gear-boxes, back axles, radiators, and bonnets were in the section devoted to motor-car parts, and in accessories were head-lamps, horns, and the thousand-and-one goods that constitute the fittings for the modern motor-car. The exhibit testified to the ability of the firm to cater for all classes of motorists, and those who require any of the goods we have mentioned would do well to communicate with Messrs. Swan and Co.

The Wallis Steam Tractor and Wagon.

Messrs. WALLIS AND STEEVENS, LTD., of Basingstoke, exhibited one of their standard steam tractors and a 5-ton steam wagon. The Wallis tractor has become such an everyday feature of modern road traffic as hardly to require description. The one on view was intended for Messrs. Pickford, the carriers, and makes the twenty-fifth machine supplied to this firm. The engine is of the compound type, with link motion operating slide valves on the outside of each cylinder, so that the steam chests are readily accessible. The whole of the motion is enclosed, together with the change-speed gear. The boilers are of the locomotive multi-tubular pattern, the water being fed by a steam-driven automatic ram pump and injector. A water-lifter and hose are supplied. The tractor, which is provided with springs to both axles, has a patent draught-controlling arrangement, consisting of a pivoted baffleplate in the smoke box. The 5-ton steam wagon, of which we give an illustration in Fig. 59, is described by the makers as their standard tractor put between shafts. The boiler, engine, and countershaft, together with the front axle and steering gear, are practically identical with that on the tractor. The channel frames of the wagon are riveted to plates secured to the fire-box shell plates, and are continued to the smoke-box, where they fit into brackets, but are not fastened rigidly to the latter, so that the boiler is free to expand, independently of the channels. The compound engine is erected over

Fig. 59.—The Wallis and Stevens Steam Wagon.

the boiler, and all the motion is enclosed and run in oil just as in the ordinary type of under-type steam wagon engines. To stand the heavy tensile strain to which it will be subjected, cast-steel gearing is employed, the pinions being machine-cut to avoid noise and produce easy running. The drive is transmitted from the second-motion shaft by a Renold roller chain to the differential on the live back axle. Two speeds are provided for, and a locking arrangement is fitted to prevent one speed gear being thrown in before the other is out. An injector and crank-shaft eccentric-driven direct-acting pump feeds the boiler. We may add that, like the tractor, the wagon is intended for Messrs. Pickfords.

The "G.-L." Carburettor.

The sectional view of the "G.-L." carburettor in Fig. 60 will be of interest to the many visitors to the Show who saw this economical type of carburettor. It was exhibited by CARBURATION, LTD., of 85, Fleet Street, London, E.C., and is based upon the principle of supplying differing quantities of fuel at different compressions of the engine, the quantities supplied being further varied in relation to the engine speed. In the "G.-L." carburettor the necessary richness for starting is attained in a simple manner, the throttle being constructed in such a form that, at one point of movement of throttle lever, the throttle proper becomes

wide open; at the same time nearly all air supply is closed. Turning the starting handle under this condition induces a good flow of petrol from the jet, accompanied by very little air, which both occur at the same time, so that the engine has no chance of refusing to start. Having placed the throttle lever at starting point, the handle is turned once or twice, and, where fitted with magneto, the engine starts immediately, or, in the case of a car using coil and accumulators, the engine starts on the switch. The vaporisation of the fuel is accomplished perfectly. Instead of attempting to spray the fuel as usual, a flat, curved surface is presented to the jet, the distance becoming greater or less in accordance with the throttle-opening. On reaching this surface the petrol spreads out into a thin film, which is swept upwards towards the engine by the incoming air, which, owing to the tapering form of the air passage, increases in velocity as maximum point of throttling is reached. This method of dealing with the fuel gives a very perfect vaporising effect, more in the nature of a surface than of a spray carburettor. In driving, the air-admittance port opens and closes in fixed proportion to throttle-opening, the proportion between inlet and outlet being such that correct mixture is allowed at extremely low speed, the throttle remaining in the same position; the tendency to take more petrol as speed picks up is counteracted by the "G.-L." controller; thus the mixture remains correct for all speeds, no matter at what position the throttle may be set.

The Davis Paraffin Carburettor.

In view of the ever-increasing cost of petrol and the increasing use of commercial motor vehicles and motor boats, special interest attaches to any new ideas with regard to carburetting or vaporising devices to enable paraffin to be successfully utilised as a fuel for internal combustion engines. We give herewith in Fig. 61 a sectional view of the carburettor which Mr. F. R. Davis, of Shawford, Winchester, has devised, and which has been put on the market by the DAVIS PARAFFIN

CARBURETTOR COMPANY. Since we previously noticed the apparatus, about a year ago, many changes have been made in the design, with the view of increasing the efficiency. The carburettor is made in two types, one in which it acts as a perfect engine governor and the other non-governed. As will be seen, the device consists of a cylindrical chamber surrounded by a jacket through which all or a part of the exhaust gases pass on their way to the silencer. This chamber contains a revolving fan or distributor mounted on a hollow spindle, driven from the engine by a pulley, gear, or sprocket wheel attached to a flange, at a speed of from 400 to 500 revolutions per minute. This distributor, assisted by the heated jacket, at once atomises the paraffin, which, mixing with the air, becomes thoroughly vaporised before entering the cylinders. The perfect proportion of air admitted is exactly regulated by a sliding throttle, keyed to a rod actuated by an extremely sensitive governor, supplemented by a control from the dashboard. The paraffin is supplied by a forced feed also controlled by the governor, which can only permit the exact amount necessary to reach the vaporising chamber. Petrol is used to start the carburettor, but after about a minute sufficient heat is generated to enable the apparatus to vaporise the paraffin, the petrol cock being then shut off and the one for the heavier fuel opened. The petrol is sprayed by a jet at the rear, and, falling on the revolving atomiser B, is vaporised and mixed with air which is drawn in through the inlet E by the suction of the pistons. The admission of air is regulated from the dashboard by the sliding cover E1 to suit the varying climatic conditions, and, as will be seen later, is supplemented by an automatic control, this combination of hand and automatic control giving the utmost delicacy of adjustment. The paraffin is afterwards allowed to enter by the needle valve F, the correct position of which is soon found to admit the right quantity. The paraffin throttle G now comes into action to accurately measure and adjust the supply, and this can be set higher or lower by the nuts H, so as to meet the requirements of each different type of engine. Next the fuel passes through the hole J into the pump chamber over the copper pipe L, through the spraying nipple into the vaporising chamber, the ball valve K preventing its return, and, falling on the revolving atomiser B, is spread and carried by centrifugal force against the heated walls of the chamber. The highly explosive vapour thus formed is then drawn into the cylinders through the induction pipe M. Both the throttle N and the paraffin throttle G are actuated simultaneously by the same rod, which slides through the hollow spindle Q, and in the governed type is worked in such a way that when the load is put on the engine and the speed consequently reduced the governor weights drop towards the centre, thereby admitting more air and paraffin, and consequently producing a greater

Fig. 61.—Sectional View of Davis Paraffin Carburettor.

volume of gas. On the other hand, should the engine race, the governor thrusts in the tapered rod under the fuel control piece G and closes both the air and fuel inlets. In the non-governed type the rod is made concave, and the action is reversed. As soon as the governor weights open the rod is thrust forward and the paraffin throttle G drops into the concave rod, and instead of cutting off the supply of oil, admits more, the air throttle N at the same time being projected towards the body of the carburettor permitting the admission of more air. The carburettor, which was shown fitted to a Blake 7.9-h.p. two-cylinder marine motor, is being made in sizes suitable for engines of from 2½-h.p. to 100-h.p.

Prested Electrical Novelties.

Representative of the excellent productions of the PRESTED MINERS' GAS-INDICATING ELECTRIC LAMP COMPANY, LTD., of Elthorne Road, Holloway, London, N., was the display made by that firm. They point to their large output and improved methods as enabling them to supply high-grade goods at moderate rates, and are referring clients to the results of the new plate used in the Prested batteries for the last eighteen months as proof of their capacity to give satisfaction both to those who own cars and those who ride motor-cycles. The coils are now guaranteed without qualification for twelve months, wear of platinum points alone being excepted. They have a coil with a single trembler for use with multi-cylinder engines, and this has already been adopted for the 1908 season by many leading motor-car constructors. We illustrate in Figs. 62 and 63 two important specialities in the Prested test lamp and the Prested plug. Both are

Fig. 62.—The Prested Accumulator Tester.

Fig. 63.—The Prested Sparking Plug.

good and reliable devices. Mention must also be made of the Prested contact maker. The brushes of this are of copper gauze, and present a constant surface to the commutator, while the fact that all the wearing parts are easily replaceable is a further point in its favour. Recently we published full descriptions of the leading specialities of this company, so that detailed accounts of their reliable instruments are now superfluous.

Repairing Tyres.

Recently we referred to the "Marles" emergency patch for dealing with bursts in motor covers introduced by the SOUTH-WESTERN MOTOR AND RUBBER COMPANY, 9, Royal Parade, Kew Gardens, London, S.W. This is a practical notion for repairing outer covers without the use of solution or vulcanising. The patch is slipped in between the cover and the tube, gripping the latter so as to hold it in position. Another speciality at the stand of this company was the "Grip" fluid for securing a firm and immovable jointing of rubber; hence its utility in dealing with motor tubes. The South-Western Motor and Rubber Company have specialised in this department of work, and their experience in rubber and tyre repairs is at the disposal of motorists generally.

Motor Bodies.

The Exhibition always brings new firms in the motor body building section of the trade to the front, and this year Mr. A. BARNETT was a newcomer, whose exhibit of a single landaulet body in wood and iron revealed his capacity for good work. Mr. Barnett's headquarters are at Thrapston, Northamptonshire, and from his works there he has sent out bodies for all classes of motorists to all parts of the country. His exhibit at the Show was much admired, and good business should result from his enterprise.

Motor-car Leads.

In addition to their dry cells, Messrs. SIEMENS BROS. AND CO., LTD., made a display of their motor-car leads for high or low tension. There is no need to dwell upon the necessity of securing that the leads connected to the sparking plugs should be reliable; nor is it necessary to emphasise the experience of this firm of makers with regard to electrical cables. The leads shown on their stand were very flexible, and were composed of the best quality of material throughout. The conductors consist of high conductivity tinned copper wires, No. 36 S.W.G., insulated with a thick layer of pure rubber next to the conductor, and then two layers of mixed rubber, the whole being vulcanised together.

The Prevention of Dust.

Messrs. WAYMAN AND MATTHEWS had a Bay in the Gallery, where they showed a 20-24-h.p. Junior chassis, the Jouvence non-skid, the Rapeasy tyre lever, successfully introduced to motorists at the 1907 Cordingley Show, and the Wapama patent dust device, for preventing the raising of dust by motor-cars. On page 88 of our issue for the 28th ult. reference was made to the success attained by this device in the trials organised by the R.A.C. One feature of the arrangement is the fitting of a double bottom to the car, so that a current of air passes beneath the vehicle, being deflected upwards at the back; but the fitting of detachable discs

on the ordinary wheels of the car is a most important part of the device. The revolution of the spokes of a wheel is a considerable factor in raising dust from the road, and the attachment of these discs so that the spokes are encased by a light thin strip of metal destroys their power in that direction, and prevents the raising of dust to a great degree. This has been well demonstrated both experimentally on the track and actually on the road. The headquarters of the firm who are conducting to the popularity of the motor movement by the introduction of such a desirable appliance, is 1, Albemarle Street, Piccadilly, London, W.

Leather and Accessories.

Considerable interest attached to the display made by Messrs. GEORGE JOHNSTON AND CO., of 110, Cannon Street, London, E.C., whose miscellaneous collection of goods required by the motor-car maker comprised many novelties. Rubber goods formed one section, and here were seen window strips, matting, twills, drills, &c. Several specimens of hides were exhibited for the upholstery of cars, and special fabrics for Cape cart hoods constituted another interesting department. In ironmongery for motor-body builders, carriage cloth, &c., were many specialities, and celluloid fittings, together with many sundries, made up a varied show, which demonstrated the varied character of the business done by Messrs. G. Johnston and Co.

The "Fastnut."

At the stand of Messrs. FASTNUT, LTD., attention was again directed to their device for holding nuts and securing them under any vibration. The main features of the "Fastnut" washer have been made familiar at the Cordingley's Exhibition for some years past, and the fact that accident insurance companies are making reductions on their premiums for the insurance of cars fitted throughout with this washer is a testimony of its value. The use of the "Fastnut" obviates the employment of check nuts, drilling bolts, and fitting castle nuts, split pins, &c., and effects economy of time and money. This device is now used by most of the leading motor-car makers, as well as by the chief engineering firms of the country.

The "Sprinter" Specialities.

The APPLIANCES AND GENERAL ENGINEERING COMPANY, LTD., of 3, Rosebery Avenue, London, E.C., showed the "Sprinter" detachable rim, in which the use of nuts and bolts is obviated, and any tendency to creep is successfully resisted. The rim can be easily detached, and, having been remounted, fits in slots, and is secured by a wedge-piece firmly held by a spring. The same firm showed the "Sprinter" petrol gauge, which is suitable for any gravity-fed car. The gauge is about twelve inches in height, and the amount in gallons is shown by pointers, which can be easily adjusted to suit any shape of tank.

A New Sparking Plug.

Recently we referred to the Reliance sparking plug introduced by Messrs. S. AND F. STEPHENSON. This is illustrated in Fig. 64, and attracted considerable notice throughout the Exhibition. In addition to

Fig. 64.—The Reliance Sparking Plug.

this speciality the firm also showed the Fulton marine motor engines. The carburettor is of good float feed type, making the engine very easy to start and economical in operation.

Cork Pavement.

In one corner of the Exhibition the CORK ASPHALT, LTD., of 33A, The Broadway, Hammersmith, London, W., showed specimens of their improved cork pavement for garages and other locations where a durable, non-slipping, non-absorbent pavement is desirable. It minimises the noise of vehicles passing over it. This form of cork pavement is absolutely damp-proof, very quickly drying, and easily cleaned. In the various places where it has been adopted the durability of substance has been well proved.

Larrad's Timer.

At the stand of LARRAD'S PATENTS SYNDICATE, Bexhill, the petrol motor valve timer, which was fully described and its operations diagrammatically illustrated in our issue of February 1st, attracted attention. As has been generally indicated to our readers, this is a device by means of which absolute synchronism in the setting of the inlet and exhaust valves of petrol motors is obtained with advantage to their power and silence when running.

Messrs. Fair and Co.'s Accessories.

Among the notable exhibits on the stand of Messrs. B. M. and W. D. FAIR AND Co., of 3, Great Winchester Street, London, E.C., was the high-tension Gibaud magneto, which, working on ball bearings throughout, has the merits of simplicity, accessibility, and sound construction. The firm issue a thoroughly practical series of instructions, a perusal of which will convince prospective purchasers as to its excellence. Other novelties shown on this stand included Noake's forced-feed lubricators, Roche ball-bearing back axles and "gate" change gear-boxes, Vermot springs and front axles, and the Percival control lever.

The "Hurmid" Engine.

At the stand of Messrs. HURST AND MIDDLETON, LTD., of Windsor

Road, Holloway Road, London, N., were examples of the "Hurmid" engines, Sharpe's silencers, and of broken castings as repaired by the Fitton Engineering Company, of 664, Old Kent Road, London, S.E. This company specialises in the repair of cylinders, differential cases, &c., and have won eulogy from many clients, including the chief engineer of the London General Omnibus Company, for the excellence of their work. The end of a Daimler differential casing was welded by them, the break being almost imperceptible. From the specimens shown it was evident that the Fitton Company is well able to

Fig. 65.—The Fitton Repair Work.

carry out every variety of work of this kind, a fact which secured them plenty of business at the Exhibition. A four-cylinder 18-h.p. "Hurmid" engine was shown, and also a selection of crank shafts, gears, and accessories. Referring to the engine, we may say it has four separate cylinders. The crank shaft is cut from a solid bar of steel and the bearings between each throw are lined with white metal. Mechanically-operated valves are fitted, these being located on opposite sides of the cylinders. They are interchangeable, and can be readily removed without any connection being disturbed. Altogether, the "Hurmid" engine is distinguished for simplicity and accessibility.

The Vulcan Specialities.

Speed indicating and recording instruments were the leading feature of the display of Messrs. WM. GRIFFEL AND Co., of the Vulcan Works, St. Thomas Street, London, S.E. The new 1908 Vulcan speed indicator, combined with distance and trip recorders, is notable for simplicity, and as the figures for recording distances are operated by mechanism entirely distinct from that operating the speed indicator, any possible imperfection in one cannot react on the other. The speed indication is obtained electrically, whilst the distance record is operated by a slowly-moving shaft, which, it is claimed, having no work to do beyond moving a small wheel on the dial one revolution in three minutes, is unlikely to cause trouble. This new instrument is supplied with 4-in. dial only, with nickel or brass finish. A special point is made of the adaptability of these and other Vulcan speedometers for fixing for driving from the back or front wheel, or even from the cardan shaft. There was also exhibited a new instrument which attracted considerable attention. This is a petrol meter and engine revolution counter, which is disposed for fixing on the dashboard, and has the dimensions of 8 in. by 4 in. by 2½ in. only. The arrangement is such that it can be readily fitted without any alteration to the car. The indications given show the petrol consumption per 100 turns of the engine, and can be read to as low as 1.5th fluid oz. The Vulcan distance recorder or odometer was also shown in various sizes, this instrument being adapted for fixing to the hub-cap of the road wheel, to which it forms a permanent attachment that can be removed with the hub-cap when occasion arises. No adjustment or operating devices are necessary, the rotation of the wheel giving the movement required. Exhibits of the Vulcan auto-tremblers, hot wire voltmeters, and high and low tension cables completed an attractive display.

The New Illuminant.

An important section of the Exhibition was that devoted to demonstrations of the practicability, economy, and efficiency of petrol gas for lighting, heating, and cooking purposes. In this direction the Cordingley Show has played an important educational part; and the various concerns that are specialising in the plant for the production of the new illuminant have recognised that fact. Those showing their system in

operation were the NATIONAL AIR GAS COMPANY, of 70A, Basinghall Street, London, E.C., which has an apparatus generating a gas composed of 98½ per cent. of air and 1½ per cent. of commercial petrol vapour that is, by automatic and thermostatic control, maintained uniformly under all conditions. The "DE LAITTE" GAS MACHINE SYNDICATE, LTD., 117, Middlesex Street, London, E., were represented by several plants, which can be supplied with capacity of from 15 to 1,000 lights. Showing similarly economical results was the plant of the PRAED PATENT SAFETY GAS LIGHT COMPANY, LTD., of 28, Victoria Street, Westminster, London, S.W., in which a small hot-air motor actuates an air propeller, and a small pump by which the requisite volume of air and petrol are delivered into the carburetting chamber. Yet another system shown was that made under Cox's patents by the NON-EXPLOSIVE GAS COMPANY, LTD., of Commercial Road, Westminster, S.W. In this the apparatus is of a fivefold kind, consisting of (a) hot-air motor, (b) blower, (c) sight-feed carburettor, (d) expansion chamber for petrol, (e) small holder acting as controller. In the case of all these systems the superiority of the light obtained over that of the ordinary coal gas was obvious, while the economy assured should lead to many inquiries following the successful demonstrations that were given through the week.

The Motor House.

In a conspicuous position in the main hall the MOTOR HOUSE, of Euston Road, London, N.W., made exhibition of several notable makes of vehicles, while in the Gilbey Hall, on the concluding day of the Show, they gave illustration of an important section of their business—viz., the sale of motor-cars by auction. Every Thursday throughout the year these take place, and, judging from the experience of those who attended the auctions on the 28th ult., such sales afford a most effective means of bringing buyers and sellers together, with apparent satisfaction to both parties.

The Stewart Speedometer.

The STEWART AND CLARK MANUFACTURING COMPANY, of 11, Denmark Street, Charing Cross Road, London, W., had an interesting display of their specialities for motorists, among which were a foot-warmer, in which the heat is maintained for twelve hours by the use of a special coal-brick retained within the device, and a long-distance siren, in which the volume of sound is under complete control. But the main feature of interest was the Stewart speedometers, which are guaranteed for five years, and attracted the favourable notice of visitors. The Stewart speedometer operates on the principle of centrifugal force, and combines accuracy with sound construction. One form of combination speedometer-odometer registers up to 50 m.p.h.; another registers up to

Fig. 66.—The Stewart Speed Indicator and Mileage Recorder.

60 m.p.h. In connection with the speedometer, mention must also be made of the swivel joints and flexible shafts which are used exclusively therewith. The use of these joints permits the shaft to be carried back to the dashboard without right-angle bends or any passing under the spring. In the shaft the core is made of file hard units hooked together into a chain, so that in the event of an accident a new link can be hooked on in a few moments without the aid of tools. The dial of the instrument has its good features. It is of 4-in. size, and the figures in black enamel stand out so distinctly that they can be read from the tonneau as well as from the driver's seat. The scale is evenly spaced, and the pointer is remarkably free from oscillation. It at once points to the exact speed at which the vehicle is travelling, and stays there, the instantaneous response to changes of speed being a noticeable merit.

Sealomatic Inner Tubes.

The Sealomatic inner tube, which has recently been described in our columns, was shown by Messrs. GILLESPIE AND Co., of 90-93, Fleet Street, London, E.C. These inner tubes are practically the same as ordinary inner tubes, the real innovation consisting of a lining of a patented material and another lining of a material made by a secret process. It is claimed that neither of these linings can be affected by either hot or cold air, by any metal or rust, or by any instrument that may penetrate it. The action of the two linings is simply to seal up any hole that may be made through them—a fact that was amply demonstrated every day during the Show. The Sealomatic inner tubes are put on the wheels and inflated in exactly a similar manner as the ordinary inner tubes, and are used at precisely the same air pressure. In addition to a selection of these specialities, the company attracted attention to some tyres containing the inner tubes, into which several nails had been inserted, while a tyre gauge was shown to prove that the pressure had in no way been affected by the treatment received.

Body Work.

An interesting display made by Mr. T. H. GILL, of 23, Chilworth Street, Hyde Park, London, W., included a patent direction stop signal for use at night-time, and serving a useful purpose. Here, too, was a folding wind screen, to fold either way and remain a fixture where wanted. Mr. Gill also showed a roomy laundulet body, well upholstered and indicating a good order of carriage work. The exhibit was completed by the Gratz speedometer, which was originally brought before the public at an earlier Cordingley show.

High Speed Turret Lathe.

Machine tools naturally found a place in an automobile exhibition that is recognised by the trade as sufficiently varied to embrace every aspect of the industry. This year the COLCHESTER LATHE COMPANY, Hythe, Colchester, made their *début* at the Cordingley Show with a selection of their excellent machines for the modern motor-car works. The company's 7½-in. centre self-acting, sliding, surfacing and screw-cutting gap lathe occupied a place on the stand. In this the headstock is very powerful, so that high-speed steel can be used to full advantage. A uniform range of speeds can be obtained suitable for all classes of work. The hollow spindle is bored to admit a 2 in. diameter rough bar, is fitted with ball thrust, and runs in ample parallel heading of special phosphor bronze. All the gearing is machine cut and guarded, and all pinions and reversing wheels are made of forged steel, and machine cut from the solid. The loose head has a large base, and is gripped to the bed by eccentric and handle. It has an accurately ground spindle, and is adjustable sideways for taper turning. The saddle is very heavy, with long bearing surface. It is of sufficient length in front of the bed to enable the largest diameter of work to be faced with one sitting of the tool. The rack and pinion are of steel, and the self-acting sliding motion is put in and out of gear by a small lever conveniently placed in front of saddle. The saddle and slide screws are indexed. The leading screw is ¼ in. pitch, fitted with phosphor bronze double clasp nut. The self-acting feeds are positive, and are reached by gearing from headstock to backshaft. They can be instantly changed by means of a lever placed in front of the bed within easy reach of the operator. The bed is of heavy and strong section, and fitted with a half-gap piece. The standards of the bed form change wheel and tool cabinets, each wheel having its own place and being easily accessible. The lathe besides being extremely powerful is also very accurate and easy to handle, and is supplied with 15 in. and 24 in. diameter face plates, catch plate, twenty-two machine-cut change wheels, travelling stay, double countershaft with pulleys 14 in. diameter, spanners, etc.

The Motoskate.

The Motoskate was one of the novelties shown by Mr. H. C. Slingsby, 142, Old-street, London, E.C., whose depôts at Bradford, Liverpool, Manchester, and other provincial cities, are well known to those who move about the country. In garages and motor establishments generally, the Motoskate serves a useful purpose in enabling one person to move a car from one position to another without any great exertion; and in crowded places will considerably help in washing and other operations. Placed on four such Motoskates a car can be turned completely round in its own length. The device is well and substantially made, being capable of sustaining a weight of one ton. There are many other conditions which the Motoskate can amply fulfil, and its adoption in the garages throughout the country is only a matter of its advantages being made known to the trade. A comprehensive exhibit of trucks, etc., for various industrial purposes was also on the stand allotted to Mr. Slingsby.

Aluminium Goods.

At his familiar stand in the Arcade, Mr. R. W. COAN again demonstrated his capacity for dealing with aluminium and repairing the same. Crank cases, &c., can be repaired by Mr. Coan—no matter how badly broken, as the specimens shown amply proved. Gear-boxes and all classes of castings for the motor trade form the staple portion of the exhibit, in which was also included the steering wheel with hollow rim and spokes, which is made warm by running the hot water from the circulating pipe through the wheel. This has long been before the trade, and having regard to the severity of the weather of late, is an invention that should be appreciated.

Waterproof Clothing.

A capital show of clothing for motorists was made by Messrs. SAMUEL BROS., LTD., whose establishment on Ludgate Hill, E.C., is popularly associated with the "Omne Tempus" cloth—a really rainproof cloth that contains no trace of rubber. Ocular demonstration was made of its qualities in resisting water, and its sevenfold virtues are thus summarised by Messrs. Samuel Bros., Ltd., viz.: It is porous, odourless, healthy, comfortable, well-fitting, cool, and uneccentric. To motorists who are out in all weathers "Omne Tempus" cloth comes as a boon and a blessing; and the firm's many descriptions of garments for sportsmen produced in this cloth naturally attracted great attention.

Lathes.

At the stand of Messrs. DRUMMOND BROS., LTD., of Rydes Hill, near Guildford, was a duplicate of the 5-inch centre screw-cutting lathe which the firm have supplied to the King's garage at Sandringham, a 3½-inch self-acting light lathe, a small hand-lever shaping machine, and a complete assortment of lathe accessories and small tools. In addition, considerable notice was taken of a "Workman's"

Fig. 67.—Drummond's 7½ in. High Speed S.S.S. Lathe.

6-inch raising to 9-inch lathe designed for professional repairers. This has an extra heavy girder-form bed, hand surfaced, and mounted on heavy cast-iron standards. A novel and effective form of raising piece has been introduced, in using which the accuracy of the lathe as to lineability is maintained. Further improvement consists in the tee-slotted table, which gives opportunities to the ingenious mechanic to find infinite uses for this lathe, the sound construction of which is distinctly notable.

Motor Lawn-mowers.

The petrol lawn-mowers of Messrs. RANSOMES, SIMS AND JEFFERIES, LTD., are to be found on the estates of many leading noblemen whose interest in automobilism is of a very practical nature. Among these are the Duke of Portland and the Earl Fitzwilliam. They are employed by several of the leading golf clubs and by the L.C.C., while they have given equally good satisfaction in cutting the grass of the cathedral close at Salisbury as on the lawns of the Tooting Bec Asylum. At the exhibition they were shown in three sizes, 42, 30 and 24 inch, operated by motors of 6, 4 and 2½ b.h.p. respectively. The power is transmitted by chain gear to the driving rollers and to the cutting cylinder through a reducing gear. This also acts as a clutch for starting and stopping the machine independently of the motor. The cutting cylinder can easily be put out of gear when it is required to roll the grass only. In the large machine the driver sits on a spring seat behind the machine, and has perfect control over every part. Simplicity of arrangement is the ideal that has been reached in the design of the Ransome motor lawn-mowers, and the fact that magneto ignition only is employed is a consideration of moment in country places. Altogether efficiency of work, as well as economy, are secured by these well-constructed machines.

The British Divisible Rim.

An interesting display was made by MAISON TALBOT, of 1, Long Acre, London, W.C., who showed a complete range of tyre sundries, mechanical air pumps, modulation exhaust whistles, and similar goods. But the *clou* of this exhibit was the British Divisible Rim. Most specialities of this kind are recommended as a means of getting the motorist home, or to a near garage. The British Divisible Rim is a practical means of supplying more than this, for it secures the changing of the damaged tube or cover in considerably less time than has hitherto been done. An advantage in favour of its introduction is that both the existing rims and the felloes can be utilised, and the weight of the wheel is only slightly increased in the process of adaptation. The rim is divided in the middle, and two rows of lugs are stamped inwards on it at distances of one and a half inches apart, as shown in Fig. 68. The locked rim has oblong slots across it, into which the lugs on the rim enter, securing the two parts being brought firmly together. By prising out one end of the locking rim it can be easily removed from inside the rim when that is off the felloe, leaving its two parts free, so that the cover can be removed or replaced. When the two parts of the rim are again placed together the locking rim can be easily brought into position and the whole device locked again. A security band fills the narrow channel between the beads in the base of the tyre, and prevents nipping and chafing, and generally adding to the life of the tyre. This band really constitutes a continuous security bolt, being secured circumferentially in place by a countersunk screw passed through a hole in the rim between the ends of the locking ring into a metal socket provided in the band diametrically opposite the valve, which is placed between its ends and

Fig. 68.—Removing the Locking Rim from the Divided Rim.

Fig. 69.—Removing one-half of the Divided Rim.

automatically clamps them in place. These are the main features of a device which has already been adequately tested and proved its value. In Fig. 69 is a divisible rim and tyre as detached from the wheel. This illustrates how one-half of a divided rim is replaced or removed in connection with the changing of the air-tube. Fig. 68 shows the locking ring being replaced or removed within a divided rim. The method of attachment to the wheel gives ample security. This is done by set screws with milled heads and coned points fitted in tapped holes in the felloe and steel tyre. When screwed up the bolts are fixed by butterfly lock nuts beneath the heads. Not only is security of attachment thus secured, but ease of detachment is a good point worthy of notice. In the British Divisible Rim Maison Talbot have a device which represented one of the most simple and efficient specialities of the kind in the show.

Metal Engraving.

The STANDARD METAL ENGRAVING COMPANY had a large and varied display of their specialities for the motor industry. These included a splendid selection of name-plates, from which we learn that the firm have supplied these to most of the leading firms in the trade. Radiator plates, step plates, and dashboard plates were shown, the work being of a very high grade. The Standard Metal Engraving Company have certainly a large connection in the industry, and its continuance is assured by the quality of the work done.

Simplex Detachable Rim.

The SIMPLEX DETACHABLE RIM SYNDICATE, of 26, Percy Road, Isleworth, London, S.W., showed the Simplex detachable rim, which can be easily attached or taken away. There is no complicated mechanism. A special security bolt is provided with steel plugs,

which pass through the rim into coincident holes. These plugs hold the rim firmly together. The washer of the security bolt is fixed to the underside of the felloes. Round the whole of the circumference a rubber ring is placed to make the joint watertight, and to remove the side of the rim all that is necessary is to unscrew the security bolts.

Lubricants.

Lubricants for motor-cars were the feature of the display of PRICE'S PATENT CANDLE COMPANY, LTD. The high-grade preparations of this firm have long been before the motoring public, and their specialities are so generally known that brief mention only is necessary on the present occasion. "Motorine" and "Oleogene" are the chief lubricants for general automobile purposes. For gear boxes "Belmoline" and "Battersea Gear Oil" have special merits. "Cirogene" and "Rangraphine" are prepared for chains; and, as a preservative for leather-faced clutches, "Curroleum" is recommended.

Miscellaneous.

In the Arcade Mr. W. HAYES, 44, Ball's Pond Road, London, N., showed the Jack-no-skid for motor-cycles, which combines in a very light form a jack and a non-skid appliance. This is operated by hand or foot, and is made to clip on the chain stays, and also to fit on to the back wheel spindle. It takes the form of small wheels, which are easily and automatically let down to the roadway when the surface is greasy.

Gre-solvent, for dissolving the grime and grease inseparable from the mechanical aspect of motorism, was shown by Messrs. BEANLAND, PERKINS, AND Co., of Leeds.

At the stand of Messrs. E. BROWN AND SONS many varieties of polishes were shown, including the Rolledge auto polish for cleaning the leather and enamelled parts of cars.

The CAR (AND GENERAL) INSURANCE CORPORATION, LTD., called attention to their system of insurance of motor vehicles.

Among the newcomers to automobile exhibitions were FOUNTAIN'S COACH AND MOTOR COMPANY, LTD., of the Grove, Ealing, London, W., who showed the Brock patent Cape cart hood for side-entrance cars. This is so designed that it can be set up for use by one man, whose unaided efforts are sufficient to easily bring it down again.

Fluxite soldering paste for soft soldering was shown by the AUTO CONTROLLER AND SWITCH COMPANY. This material will solder all metals except aluminium, does not corrode, and is extremely suitable for electrical work.

The "Runphar" non-skids were being shown by the ABERCORN MOTOR AND TYRE COMPANY, who are making a prominent feature of their "Runphar" chrome leather.

The CALMAN ASBESTOS AND RUBBER WORKS, LTD., had an excellent show of their motor tyres, which have come well to the front since their introduction to the motor world. The Calman motor tyre is made with square tread, plain and ribbed, while a non-skid tyre, with chrome leather band steel studded, is also shown.

The NATIONAL MOTOR ACADEMY AND EXCHANGE, LTD., had a stand from which they made known their facilities for giving really technical instruction in motor-cars, not only in the lecture room, but also on their track at Boundary Road, Notting Hill, W., which, by the way, is the only private track in London.

The OLIVER TYPEWRITER Co., LTD., took occasion of the opportunity to bring their machine to the notice of those responsible for the organisation of the commercial side of the motor industry.

Several good types of Cape cart hoods were exhibited by the CAPE CART HOOD COMPANY, whose range of folding and adjustable wind screens is complete. They have specialised in connection with side-entrance cars, as their exhibits amply testify.

The "O.S." speedometer has become favourably known since first introduced by Messrs. W. SEARLE AND Co., of 33, Glasshouse Street, London, W. It attracted considerable notice at the Show, as did also the Fulmen accumulators and the "A.V." plugs, the agencies for which have been acquired by the firm.

A fine show of nameplates, &c., for affixing to various parts of cars was made by Messrs. WEINBRENNER AND Co.

Both the MOTOR UNION and the AUTOMOBILE ASSOCIATION were represented, and among the miscellaneous exhibitors Messrs. J. and E. MARX showed stencil plates for marking the numbers on cars, and "Garleo" cloths for cleaning the same; the WEST END MOTOR-CAR PACKING Co. drew attention to their facilities for packing motor-cars; Mr. F. W. HALL had a collection of brass steps, &c., for cars; the GRESHAM PUBLISHING Co., and other publishers, had complete ranges of their publications for motorists and engineers; and other firms contributed to the variety and interest of the display.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE TAXATION OF CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I suppose that the general principles which may be held to justify the taxation of motor-cars are, first the fact that cars are "luxuries," and secondly the alleged serious damage which they cause to the "King's highway." With these principles I could not quarrel myself, but I venture to put forward a humble plea on behalf of medical men and others who, like myself, drive small low-powered cars, which practically do no harm whatever to the roads, and are already taxed to the extent of something like 24 per cent. of their value.

The damage, of which we hear so much, is produced almost exclusively by three causes, excessive speed, excessive weight, and above all by the use of steel-studded tyres; and undoubtedly when all these factors are combined, as they often are, the disintegrating effect upon the road surface is very great. But in the case of the small car the case is entirely different; indeed, I should be prepared to prove by actual experiment that my own car does not cause anything like so much "wear and tear" to the roadway as the ordinary cart and horse. I may say that the experiment has already been made by me on a small scale on my own carriage drive, while the dust, which I admit my car throws up (in consequence of the sucker-like action of the tyre combined with the draught caused by the rush of the car) is the inevitable product, not of the car itself, but of the impact upon the road of iron-shod hoofs and the friction of iron wheels.

and rejected or improved until the present-day motor-car, down to the wheels, is about as perfect as human ingenuity can make it. Even the wheel builders have risen to the occasion, and, by improving the quality of the wood used and the workmanship, have been forced by competition to supply a much more solid article than was good enough for horse-drawn wagons, but the fitting of the tyre to the rim or the rim to the tyre has had no attention worthy of remark since the time when R. J. McCreedy and Henry Sturmer advised us to carry an old tooth brush in our cycle tool-bag as a lever for our tyres. Next we get "one minute" tyre levers, a nice little set with notches to catch on to the spoke, but in this connection evolution has brought no assistance. In fact it is quite the reverse—stiffer tyre covers, tighter sizes, higher beaded rims increasing the difficulty. "Devolution" is the word, not Evolution, and the motorist groans and swears on the roadside over his punctures, and buys still longer levers.

Detachable rims or wheels only postpone the evil hour, and transfer the operation from a crowded thoroughfare and an irritating audience to a garage floor, where much wrestling and strong language may be indulged in without leading to a breach of the peace.

I think the time has come when we motorists should be supplied with something easier in the rim line. It will have to fit the present type of tyre, so that we may have no difficulty in procuring other tyres while on tour. It should be capable of being carried as a spare and exchanged easily on the roadway, but it does not interest us unless it enables us to

Racing at Brooklands.—The Amateur Handicap on Saturday last.

If any further tax is to be imposed, I am inclined to think that it should be graduated according to "horse-power." Many professional men like myself use a small car because they find it cheaper than a horse and "trap," and I submit that the two guineas a year which we already pay, in addition to registration fees, is quite enough; while, on the other hand, those people who are fortunate enough to be able to drive big cars of 30 or 40-h.p. would probably not be unwilling to contribute something further in the way of taxation if that taxation were applied where it is so much needed, to the better maintenance of the roads.—Yours truly,

WALTER CRICK.

DETACHABLE RIMS v. DETACHABLE WHEELS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Under this heading may be included almost the whole of a series of letters from prominent men in the motor world, which has been lately appearing in the motor Press and in the daily newspapers. Some of the writers have had very apparently a rusty "axe to grind," and others seem to use the opportunity for the sole purpose of reminding their friends of records won on racing tracks whilst posing as philanthropists, but none of them seem to have cared to expose the crux of the matter or the cause of the effect which they try to ameliorate, or perhaps they have not troubled to go deeper into the subject and ask, Why has all this trouble come about?

To my mind, the whole difficulty lies in what I term the very unmethodical, unmechanical system which is supplied to the motoring public for the fitting of their motor tyres to the rims supplied by the car builders.

Every other part of a car has been invented, attacked, criticised

exchange the air tube without the more or less brutal use of tyre levers. We are waiting for such, and anxiously await what the trade can do for us in this matter.—Yours truly,

"OLD MOTORIST," L.C.-6325.

THE SCOTTISH TRIAL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Noticing that rule twenty-one in connection with the Scottish reliability trials would entail a considerable extra expense to entrants, in the matter of registration, carriage and licence fees, insurance, &c., we addressed a protest to the secretary, and are very pleased to learn that the rule has been deleted.

We think that the thanks of the trade are due to the committee for this concession, because already expenses will be fairly considerable without the operation of Rule 21.—Yours truly,

ROBERT BURNS.

The Swift Motor Company, Ltd.

Rule 21 was to the effect that "no vehicle carrying a manufacturer's or dealer's general identification mark will be allowed to compete."

A BONUS SCHEME FOR DRIVERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Last year I experimented with a bonus scheme for my motor man, the terms being that I would give him an extra £80 for the twelve months on the conditions that 2s. 6d. deduction was to be made every time that the car was stopped on the road by any trouble which would

have been avoided had the car received proper attention in the motor house, and, in addition, every time that on the road any signs of omission were observed which, however, might not compel me to stop. When I give below a list showing how he lost his money, and, considering that I generally drive about 2,000 miles a month, I think it is greatly to his credit that he only lost £2 2s. 6d. during the year. The car mostly used was a 14-22-h.p. Germain.

3. 3.07.—Petrol jet blocked.
24. 3.07.—Ran out of petrol twenty-one miles from the start.
28. 3.07.—Front off tyre had 40 lbs. only after fifty miles, he having omitted to fix cap on valve.
20. 4.07.—Rubber tube leaking each side of gas bag. Lamps burnt badly and then went out. (I had warned him to replace this tube.)
1. 5.07.—Blocked petrol pipe, and no washer on valve.
2. 7.07.—Blocked petrol pipe.
5. 7.07.—Magneto terminal loose.
6. 7.07.—Strap holding down magneto loose.
- 12.10.07.—Acetylene burners blocked.
- 19.10.07.—No paraffin in off side lamp after burning one hour.
- 1.11.07.—No pliers on the car.

not be hot, but should be allowed to act for some hours, after which the pipes should be flushed out with a hose as forcibly as possible. The solution should be carefully kept away from aluminium, which is attacked by it, though it has no appreciable action on brass or cast iron, and should not much vary from the strength recommended above. Possibly, as our correspondent refers to "soda," he may have used "washing soda," which would account for his non-success. Where hard water has to be employed, the addition of glycerine to it has some effect in preventing an adherent incrustation, besides its utility against frost. Scale may be conveniently removed from a cast-iron cylinder jacket by dilute hydrochloric acid, if the cylinder is detached from the car and all brass fittings removed, otherwise it is inadvisable.]

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been reading with interest the correspondence on the above. For the benefit of owners of Darracq engines that will not run slow I give you my experience. I own one of last year's 20-28-h.p. cars, a splendid car in every respect, but it would not run slow. I consulted

Motor-Boat Racing at Monaco.—A General View of the Harbour.

- 3.11.07.—No chalk used when putting in a new tube.
- 24.11.07.—Fan belt very loose; had to stop to take up.
- 21.12.07.—Piece of metal left in brake drum after overhaul, resulting in jamming of brake.
- 23.12.07.—Two bolts out on the induction pipe. Nuts loose on seating bolts of front cylinder.

I believe this bonus system is one which might be adopted with great advantage by those who use their cars largely for business purposes, and to whom, during their drives, delays mean loss of money and unpunctuality, quite apart from the ordinary annoyance of being hung up.—Yours truly,

A. DUCKHAM.

REMOVING SCALE FROM RADIATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you would kindly inform me through the columns of the *M.C.J.* a method of removing the crustation in the radiator and cylinder jackets, causing overheating in my car. I have tried a strong solution of soda and boiling hot water for forty-eight hours, but with poor results. Thanking you in anticipation.—Yours truly,

J. R. S.

[If "J. R. S." will use a solution of 2 lb. caustic soda to a gallon of water, he should find it efficacious in loosening the scale. It need

the Larrad Syndicate about it and they said that they could make the engine run as slow as one could wish, and, moreover, undertook to do so on the understanding of "no cure no pay." I personally saw the work carried out, and, to my surprise, saw them grind great lumps off the cams. I confess I was rather dubious as to the result, but as they undertook to give me a new cam shaft if the work was not satisfactory, I awaited developments, and saw the engine put together again. When I took the car out not only did the engine run much slower but it developed more power and had a more sustained pull when running slow on top speed. Needless to say I was more than satisfied with the results, and should "Interested Enquirer" ever be in my part of the country he is quite welcome to have a run in my car, and I think he would be convinced that the Larrad setting is correct for Darracqs.—Yours truly,

R. H. GRAHAME.

SOME inner tubes were found on the road near Claygate on Sunday. The owner can regain possession on application, with description, to Mr. George Riley, Oakfield, Walton-on-Thames.

THE PARIS-MADRID RACE, 1903.—Replying to "Chanfeur," owing to the many accidents in this event, the race was stopped at Bordeaux, at which place Mr. C. Jarrott was the second to arrive on his De Dietrich car.

THE OLYMPIA INDUSTRIAL MOTOR VEHICLE EXHIBITION.

(Continued from page 131.)

Among the important examples of engineering progress, visitors were able to note the complete range of "Aster" engines, including a new 9-h.p. single-cylinder, 10-12-h.p., and 12-14-h.p. double-cylinders, and several four-cylinder engines. Elsewhere in the Gallery Messrs. Burgess and Harvey, Ltd., had four and six-cylinder White and Poppe engines, as well as White and Poppe carburettors, and a 6-h.p. single-cylinder engine for motor-boats. The same firm had also a selection of components, shock absorbers, tools, and the "Anti-panne" patches for motorists in trouble on the road. Messrs. Drummond Bros., Ltd., had a selection of machine tools for motor repair work. Among these is a new High-speed All-gear Head heavy S.S.S. lathe, which will do a variety of work, ranging from the heaviest roughing cuts to the finest class of small work. It is fitted with a new design of traversing boring-carriage, and has reversing motion for screw cutting by lever on the apron, so arranged that screws cannot be "crossed" in cutting.

The "McCord" mechanical lubricators, which we described and illustrated on the 21st ult., were on the stand of Messrs. Easton and Melville, Ltd., who also had on view the "Warner" speedometers and the "Ilo" motor lubricants, the latter being a particularly fine grade of lubricating oil. Renold, Coventry, and Brampton chains were all represented in the Gallery, the former including the new pattern 2½-inch pitch bush-roller chain for motor-wagons, with thick side-plates ground on the faces. Of strictly utilitarian interest was the display of the Steel Barrel Company, Ltd., whose welded steel vessels are coming largely into favour with the motor trade. Rectangular tanks, steel barrels, and cylindrical drums were all comprised in the exhibit. The Safety Non-Explosive Reservoir Company, Ltd., made a first appearance at a motor show with their "Saercold" safety device for the prevention of the explosion of storage and transport barrels, tanks, &c., thus securing the trade against the dangers of petrol, &c. The essential features of the new appliance are—first, a hermetically-sealed safety-plug is provided, the metallic attachment of which readily fuses at a moderate temperature. Consequently, should the vessel be exposed to heat, the plug is blown out before the internal pressure can reach a point at which it would cause a burst. The second provision is a wire-gauze cylinder, protected from injury by a perforated metal sheath, which prevents the communication of flame to the gaseous contents of the vessel, on the principle of the Davy lamp. Sir Boverton Redwood and other authorities have testified as to the value of the system.

Many electrical devices of good repute were exhibited by the Prested Miners' Lamp Company, Ltd., their exhibit being almost a duplicate of that at Cordingley's Show, referred to elsewhere. A range of C.A.V. accumulators was presented by Messrs. C. A. Vandervell and Co., who also exhibited special lighting sets for motor-cabs, motor-buses, and other vehicles in public service. The "Lodge" ignition system, introduced at the November Show, had again a place in the Gallery, where it was shown as applicable to motor-boat engines, and also for heavy oil engines. Messrs. J. Lacoste and Co. exhibited their 1908 magnetos for single and multi-cylinder engines, the "Serisol" insulated terminals, their internal-wipe accumulators, and other electrical appliances of a high grade. The Bosch Magneto Company, Ltd., had working models showing the latest forms of their ignition apparatus. The standard high and low tension magneto was also shown in operation, as was the new dual system of ignition, the latter comprising an appliance for use in conjunction with a high-tension magneto, giving dual ignition, and starting from the dashboard without any alteration to the engine, and requiring no separate contact-breaker or distributor. Working models of the British-made "Simms" magnetos were shown by the Simms Manufacturing Company, Ltd., who had also on view a six-cylinder high-tension model working in conjunction with the Simms Duplex plug adapter. In order to show the high quality of the sparks obtained under bad conditions, a four-cylinder high-tension model was working with a "Simms" sparking plug in a thick oil bath.

Messrs. A. W. Gamage, Ltd., had a representative assortment of their thousand and one accessories for the car and the driver, as well as tools for roadside and workshop use. To particularise where such a comprehensive range was shown is almost impossible.

Considerable interest was being taken in the explanations of their system of instruction in automobile work given by the Motor Schools, Ltd., who had a portion of their equipment at Heddon Street, London, W., adjoining the stand of the *Industrial Motor Review* in the main Hall.

Several new models of lamps were shown by Messrs. Salisbury and Son, Ltd., whose "Anti-Dazzle" lens we fully described at the time of the last Olympia Show. They had their lamps located on the front portion of a chassis, where they were exhibited to full advantage.

Other interesting exhibits included radiators by Messrs. Orme, Evans and Co., Ltd., of Wolverhampton; the paraffin carburettors of the company of that name; magnetos, &c., by Messrs. B. M. and W. D. Fair and Co.; the Donisthorpe petrol meter, described in our report of the Cordingley Show, where also were illustrations of a speedometer made by Messrs. Smith and Son, and shown at Olympia; the "H.F." vulcanising appliances and complete retreat plants by Messrs. Harvey, Frost and Co., Ltd.; the "Marston-Megevet" honeycomb radiators and bonnets for commercial vehicles, produced by Messrs. John Marston, Ltd.; the castings and "Eatonia" bearings of Messrs. Willans and

Robinson, Ltd.; "Parsons" non-skids, sparklet inflators, and the new "Parsons' E.R." rim, the "Fastnut" washer, the "New Era" fire extinguishers for garages; the specialities of the Motor Supply Company, Ltd.; Messrs. Ross, Courtney and Co.'s valves, pumps, lubricators, and other accessories; the dissolved acetylene outfits of the Acetylene Illuminating Co., Ltd.; the "Omne Tempus" cloth for motorists' garments, on which Messrs. Samuel Bros. have specialised, and a new Cowey speed indicator for commercial vehicles.

THE SCOTTISH RELIABILITY TRIAL.

THIS will be held from June 15th to 19th. The list of entries is as follows:—

Class 1.—10-12-h.p. Swift, 10-h.p. Cadillac, 8-h.p. Clyde, 10-12-h.p. Chambers, 9-h.p. Adler, 10-h.p. Riley.

Class 2.—10-12-h.p. Coventry Humber, 12-14-h.p. Argyll, 14-16-h.p. Belsize, 10-12-h.p. Darracq.

Class 3.—15-h.p. Coventry Humber, 16-h.p. Bentall, 12-16-h.p. Vinot, 14-16-h.p. Argyll, 12-15-h. Hillman-Coatalen, 16-h.p. Bell, 12-h.p. Star, 15-h.p. Mass, 14-16-h.p. Darracq, 12-h.p. Shamrock, 12-h.p. Star, 16-18-h.p. Vulcan.

Class 4.—20-h.p. Beeston-Humber, 16-h.p. Sunbeam station car, 18-24-h.p. Swift, 12-16-h.p. Vauxhall, 20-h.p. Coltman, 14-16-h.p. Argyll, 16-20-h.p. Argyll, 24-32-h.p. Porthos, 20-h.p. Bell, 12-14-h.p. Singer, 15-20-h.p. Panhard, 15-20-h.p. Panhard, 25-h.p. Werbell, 28-h.p. Belsize, 20-h.p. De Luca-Daimler, 20-h.p. De Luca-Daimler, 20-h.p. Cadillac, 18-h.p. Minerva, 16-h.p. Star.

Class 5.—30-h.p. Beeston Humber, 20-h.p. Sunbeam, 20-h.p. White steam car, 25-30-h.p. Brown, 25-h.p. Deasy, 25-h.p. Hillman-Coatalen, 25-30-h.p. Ariel, 18-24-h.p. Panhard, 25-h.p. Atholl, special 18-h.p. Thornycroft, 25-35-h.p. Darracq, 26-h.p. Metallurgique.

Class 6.—24-h.p. Albion, 38-h.p. Daimler, 38 h.p. Daimler, 35-h.p. Vinot, 18-24-h.p. Piccard-Pietet, 40 h.p. Argyll, 30-40-h.p. Ariel, 30-h.p. S.P.A., 25-30-h.p. Maudslay, 30-h.p. Adler, 50-h.p. Darracq, 35-h.p. Deasy.

Class 7.—30-h.p. White steam car, 45-h.p. Sheffield-Simplex, 40-50-h.p. Ariel, 40-h.p. Armstrong-Whitworth, 35-45-h.p. Maudslay.

Class 8.—40-50-h.p. Rolls-Royce, 40-50-h.p. Rolls-Royce, 60-h.p. Thames, 35-h.p. Benz.

THE BROOKLANDS TRACK.

THE Brooklands automobile track was reopened on Saturday with an amateur private sweepstake, for which there were ten entries. The full course was 2½ miles, but the handicap consisted of a distance allowance.

For some three hours before the race the competitors ran their cars individually three times round the track, covering a distance of over eight miles. The handicapping was based on these trials and resulted in a remarkably close race between several of the cars, there only being one minute and three-quarters between the winning car and the last one to pass the post. Any car doing 5 per cent. better in the race than in the trial was to be disqualified.

The competitors were:—E. W. Hubbard, driving a 6-h.p. Siddeley covering a distance of nearly eight miles; G. Baxendale, a 14-h.p. Thornycroft, 15 miles; S. Sanderson, a 20-30-h.p. Unic, 18 miles; V. Lucas, a 20-h.p. Standard, 15 miles; S. G. Rendel, a 40-h.p. Berliet, 16½ miles; H. M. Bond, a 22-h.p. Berliet, 14½ miles; H. F. W. Farquharson, a 40-h.p. Berliet, 18 miles; P. F. Sterling, a 22-h.p. Berliet, 16 miles; D. Pigot, a 40-h.p. Berliet, 18 miles; and A. Lawford, a 50-h.p. Charron, 16 miles.

Rain began to fall before the race and continued throughout, but there was no sign of any skidding, and the contest was exciting from start to finish, only ten yards separating the first from the second and less than 20 sec. between the second and third. The winner proved to be the car with the smallest horse-power in the race—namely, E. W. Hubbard's 6-h.p. Siddeley; P. F. Sterling's 22-h.p. Berliet being second and G. Baxendale's 14-h.p. Thornycroft third. The official time was 17 min. 14 sec.

At the meeting at Easter there will be a race amongst owners of Sizaire et Naudin cars, and a number of private owners have entered their cars, including Colonel Cowper-Essex, Lieut. G. B. Hynes, Captain Horne, Captain James-Trevor, Messrs. Basil Gill, Dunbar Wilson, Scantlebury, Jenks, Millard, and Schofield.

THE South Western Motor and Rubber Co., of Kew Gardens, S.W., have just fulfilled an order for their "Grip cold cure fluid" for tyre repairing from Buckingham Palace.

IN the Australian Sealed Bonnet Competition six Talbots were entered and five won gold medals. The sixth lost because the owner raced a large car home and got in before time, and had marks taken off accordingly.

FROM their well-known works at Acton Vale, W., Messrs. Panhard and Levassor have recently issued a catalogue of "Specialities," a handsome book of forty-eight pages, containing some hundreds of illustrations of spares, accessories, and fittings adaptable to cars of any reputable make. It is safe to say that there are no Panhard parts or fittings, and very few of those belonging or readily adaptable to other cars of equal standing, which cannot be supplied on demand.

THE MOTORIST'S GATE TO THE CONTINENT.

BY STENSON COOKE.

"HELLO! He-e-e-l-o. That the A.A.? That the Secretary? Charles Jarrott speaking: "Say, you're shouting a good deal about this touring department of yours, and I am inclined to see what it really can do. This is Tuesday morning. I leave the Motor Club, London, on Thursday morning after breakfast, catch the mid-day boat from Folkestone, cross to Boulogne and reach the Franco-Italian frontier at—never mind. I shall drive a four-cylinder 40-h.p. car. I want a triptyque, a permis de circulation, eighty litres of petrol, tickets, a deck cabin facing south, and twenty pounds in French money. And I want a hole cut in the tariff wall of France big enough for me to drive through with a maximum of ease and a minimum of delay. Now, if the A.A. Touring Department is all you say, let it establish a record, let it spread itself. I send you a cheque to cover deposits of duty, &c., and you do the rest. Now, make things hum. Good-bye."

Be it explained here, for the edification of those who do not go down to the sea in motor-cars, that foreign countries abound in tariffs. This is to say, that you cannot sell an English or other strange motor-car in France without first paying a duty of about a sovereign sterling per

one odd records for everything under the sun, that of "clearing" a motor-car through Boulogne, timed by a watch, and this is how it was done.

A telegram from the Automobile Association was sent to the Marine Superintendent South Eastern and Chatham Railway Co., Folkestone:—

"Reserve space Charles Jarrott, car A.A. 6,000, first service Boulogne, April 2nd, arrives 11.30, leaves 11.55, deck cabin, south aspect, self and friends. Move."

Reply to Fanum, London:—"Right."

From secretary Automobile Association to Major Stevens, Gare Maritime, Boulogne:—

"Charles Jarrott and car A.A. 6,000 arrives Boulogne first service April 2nd en route Italy, wants clearance permits circulation, but no licence, make violent love French Customs, establish record, want eighty litres essence."

Reply to Fanum, London:—"Right."

Thus did it come to pass that on Thursday, shortly after noon, as the S.E. and C.R. turbine steamer Queen rocked lazily by Folkestone Quay, within twenty minutes of her scheduled starting time, C. J.'s "forty" drifted quietly between coal trucks and empty baskets on to a neat contrivance called a stage. She was attacked by four deck hands, who lashed the wheels to corner rings while two others drained the petrol tank by means of rather incongruous wash hand basins. A Derrick then neatly swung the car aboard.

Mr. Charles Jarrott leaving Boulogne on his 40-h.p. Crossley en route for Monte Carlo four minutes after the arrival of the steamer.

cwt., "all in." And in order that the tourist shall not go behind this protection by means of specious explanations, every car, good, bad or indifferent, is mulct in certain deposits, not necessarily for publication, but as a guarantee of good faith, the said deposits being returnable as and when the car shall leave the shores of France. The principle is not combated, but the practice is so intricate, so strangled with red tape, that one may with reason put the number of unattached touring motorists at a decimal point per centum.

The motoring societies make motoring and touring easy. Instead of shivering in a cold bleak "douane" signing mysterious papers, and paying over mystical amounts in French coinage with an irritating impression of having been "had" over the rate of exchange, to say nothing of the haunting fear that some breach of circumlocutory law may involve entire loss of the money, the A.A. member in search of sunshine finds every difficulty smoothed. He wants to go to Bordeaux and Biarritz, via Boulogne? Very well. Forms printed in plain simple language are ready for him to sign. Deposits are taken at the offices in Coventry Street, W., tickets issued, seats engaged, petrol commandeered; in fact, he and his car are carried about with all the directness and without the unpleasant "school treat" feeling engendered by the ordinary touring bureau. He waves his A.A. permits in the face of humbled frontier officials and goes on his way rejoicing.

The system being almost perfect, all that remained was to beat every other system in the way of application; in short, to add to the million and

Gold laced officials looked on with complacency, they had nothing else to do. Once on deck the car was made snug—French numbers replaced English ones and polite officers showed the way to the deck cabin facing south—one of the only two aboard. Here were daily papers, *M.C.J.*, cigarettes, and other necessities of civilization. So much for Folkestone. At about 1.20, English time, a small army of baggy trousered democrats stood watching on Boulogne landing stage as the nose of the turbine cut a long white moustache in the sea two miles away. At 1.33 her steam ladyship nestled comfortably by the landing stage. Thence time was measured by fifths of seconds.

Before Mr. Jarrott's party had passed down the gangway the car was deposited on the quay. Men clad in blue overalls rushed to the petrol tank with cans of essence and wide-necked funnel. Gold-laced prototypes of Folkestone fluttered about with papers, gesticulated, advanced, retired, and set to partners. The A.A. official ran here and there, persuading the petroliers, coaxing the Customs, making himself generally indispensable. Amid all the bustle stood Major Stevens, Chef de la Gare Maritime, spick and span and imperturbable, the personification of "Bond Street in Boulogne."

Thanks to his admirable engineering the hole in France's tariff wall had been widened to pass an English car through complete with certified papers signed, permit, and fuel for nearly four hundred miles, in record time, for Charles Jarrott waved good-bye and headed due south at 1.37, exactly four minutes from the moment the boat stopped.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE legal department of the R.A.C. is now in working order, and during last month dealt with more than thirty cases. In addition, the department is dealing with speed limit inquiries at Hoddesdon (Hertfordshire, and Appledore (Devon), formal notice of opposition having been given in both cases.

A smaller size of the Club badge is to be prepared to suit small cars.

MOTOR UNION.

THE Barton and Immingham Light Railway Order came before the Board of Trade a few days ago for confirmation. Opposition was offered by Mr. Moresby White for the Motor Union. The opposition was to Section 24, which proposed to allow the construction of a level crossing over the Barrow and New Holland road.

Mr. White stated that the motor traffic which went from the South to the North *via* the New Holland-Hull ferry was not merely the traffic which went into Yorkshire, but a large proportion of the traffic which went to the Continent by ship from Hull. The New Holland route shortened the distance to Hull by sixty miles and upwards from London or any place in the Eastern counties, as compared with the route *via* Doncaster. For cars coming from north to south the road was also the one arterial communication. He asked that the company should be ordered to construct a bridge; the initial expense of a bridge would be greater than for a level crossing but the working expenses would be vastly less. The statutory power to compel a railway to replace a level crossing by a bridge applied to cases of public danger and not to the convenience of free transit.

The Marquis of Waterford, the Earl of Mayo and Mr. G. T. Langridge have been elected vice-presidents of the Motor Union.

The membership figures of the Motor Union for March show that during the month 364 individual members were enrolled.

The following gentlemen have been appointed a sub-committee to consider the relations between motor-cyclists and the Motor Union:—The Rev. Hassard Short, Messrs. F. Duncan Hindley, A. E. Newton, H. R. Mayo, A. Warner, A. G. Reynolds, and W. J. Lorkin.

HEREFORDSHIRE.

OWING to the difficulties which were raised by the Bromyard Rural District Council in the matter of the Frome's Hill Automobile Trials for the Hereford Motor Trophy, the Herefordshire A.C. have had to consider the question of another venue for the trials. A meeting was held at the local headquarters on Monday, the 6th inst. Mr. Fryer Roberts presided and others present were the Rev. H. G. Morgan, Dr. Green (Ledbury), Councillor E. W. Langford, Messrs. J. C. M. Vaughan, T. A. King, A. Kear, Hall (Ross), J. Parker, Butcher, Littledale, J. Parker and A. Townsend (secretary).

A letter was read from Mr. de F. Pennefather, of Kinnerley Castle, accepting the office of president of the Hereford A.C. for the ensuing year.

The Secretary said that he had seen the Chief Constable for Herefordshire, Capt. the Hon. E. S. Stanhope, at the new proposed venue for the hill climb, and he had stated that he had no practical objection. The hill that had been selected was the Cockshut, which was about twelve miles from Hereford, off the road from Hereford to Ledbury. The measurements of the hill were as follows:—

| Length in feet. | Surface Levels. | Rise. |
|-----------------|-----------------|------------|
| 730 ... | 311 to 396 ... | 1 in 8-58 |
| 310 ... | 396 to 412 ... | 1 in 19-37 |
| 760 ... | 412 to 414 ... | 1 in 380-0 |
| 330 ... | 414 to 421 ... | 1 in 47-14 |
| 520 ... | 421 to 445 ... | 1 in 21-66 |
| 700 ... | 445 to 556 ... | 1 in 6-3 |
| 330 ... | 556 to 595 ... | 1 in 8-46 |
| 384 ... | 595 to 611 ... | 1 in 24-0 |

Total 4,064 ... 311 to 611 ... 1 in 13-54

The rules applying to the competitions on this occasion are as appended:—

A. The power of the engines to be limited in order to prevent the cars exceeding the legal limit of twenty miles an hour.

B. No car to be allowed to go up or down the hill for practising purposes at any time. Infringement of this regulation to entail disqualification.

Assuming the hill to be three-quarters of a mile (it is just over) a car would have to weigh 4,265 lbs. in running condition not to exceed twenty miles an hour. When the engine is a 4 in. four-cylinder one for a car weighing 3,000 lbs., the four-cylinder engine must not exceed 3-35 in. in diameter.

Mr. Townsend added that Mr. Riley, of Patley Court, had given him permission to put cars in his field adjoining the road.

Mr. Langford proposed, and Mr. Parker seconded, that the hill climb trials for the Hereford Motor Trophy should be held on the Cockshut Hill on Friday, May 15th.

A further letter was read in regard to the provincial meeting of the General Committee of the R.A.C. After discussion it was unanimously

decided to extend a hearty invitation to the R.A.C. to hold the July meeting on the 11th of the month at Hereford.

Mr. Norman, representing the R.A.C., was present, and described the routine of the meeting to take place at Nottingham next month and stated that a programme of a similar character would constitute the day's business at the Hereford meeting. This met with the approval of the members of the club, and the chairman assured Mr. Norman of local automobilists doing the utmost to make the day a success.

The Secretary next read the balance-sheet, which showed a balance in hand of £141 12s. 9d. This concluded the business of the meeting.

Mr. de F. Pennefather, the newly-elected President of the Herefordshire A.C., resides at Kinnerley Castle, Kinnerley, a beautiful home amid the pastoral loveliness of West Herefordshire. Besides being an enthusiastic motorist, he is a keen sportsman and politician. He is the late master of the North Herefordshire Foxhounds, and is the selected candidate for parliamentary honours in North Herefordshire.

SHEFFIELD.

THE committee of the Sheffield and District A.C. at their last meeting passed the following resolution:—"That motor-cars being already taxed more heavily than horse drawn vehicles this association is of opinion that further taxation would be manifestly unjust and would seriously prejudice an important industry.

The club also wishes to call attention to the towing of one car by another after dark, the committee having had cases brought to their notice of accidents happening to pedestrians endeavouring to pass behind a car which had another in tow on a long line and being tripped up by the line. They invite suggestions as to the best means of giving a warning that one car is towing another.

The 15-h.p. Mors Landauet recently supplied to Lord Dunraven by Mors (England), Ltd.

The car is painted dark green picked out with fine white lines, and is upholstered in light drab cloth; the inside of the carriage is very roomy, with every provision for fixing two extra seats if necessary. When the hood is down and the front pillars and window dropped into their recesses, the car is to all intents and purposes a touring car.

EAST SURREY.

THE annual general meeting of this club was held at the White Hart Hotel, Reigate, on Saturday. The report and statement of accounts were unanimously adopted. The following officers were elected for the coming year, subject to acceptance of absentees. President, Capt. Rawson, D.L., J.P.; Vice-presidents: Sir G. Livesey, C.E., Sir A. Rendel, Messrs. H. Bell, J.P., H. N. Corsellis, J. B. Purchase, and C. J. Whittington. Hon. secretary and treasurer, Mr. David J. Barry. The following gentlemen were elected on the committee:—Messrs. G. H. Bowden, N. Colman, E. H. Goad, T. Owden Hart, H. Hughes, H. R. Kempe, H. Roeling, C. H. Whittington and J. Whittington. Messrs. J. B. Purchase and C. H. Whittington were appointed representatives of the club on the General Council of the R.A.C. Messrs. G. H. Bowden and D. J. Barry were re-elected representatives on the general committee of the M.U., and to a similar position on the new body formed by the R.A.C. Mr. A. Macaire was re-elected hon. auditor.

It was decided to limit the number of official repairers to one to each district, and the following were appointed for 1908, subject to signing the usual agreement:—The Reigate Garage, Ltd., London Road, Reigate; Messrs. Chalmers and Co., High Street, Redhill; Mr. W. C. Look, Dorking. The following agents were re-appointed for the supply of petrol, &c.:—Messrs. T. S. Marriage, Bell Street, Reigate; Mr. T. Watts, Charlwood.

A discussion took place with regard to the taxation of motor-cars, and the following resolution was passed:—"That any monies raised from the taxation of motor-cars and other vehicles should be devoted to the maintenance of roads in a satisfactory and dustless condition, and that such monies should be controlled by a central department formed for

that purpose." A vote of thanks to the chairman, Mr. C. H. Whittington, concluded the proceedings.

WEST SURREY.

THE Annual Petrol Consumption Trial of the West Surrey A.C. was held on Saturday over a course of 22½ miles on the Petworth road.

The formula on which the results were adjudged was: (Petrol in oz.) ÷ (weight of car and loads in lb.), competitors being permitted to take one or more passengers, all being weighed at starting.

First place was secured by Mr. R. W. Buttemer's 14-h.p. Renault (last year's winner), with a consumption of 114 oz., or 31.95 miles per gallon, p/w being 0.347, while Mr. H. W. Moffat's 20-h.p. Rolls-Royce was second with 117½ oz., 31 miles per gallon, its figure of merit being 0.385. The remaining results were:—

| | | | |
|--|------|--------|-------|
| A. Leon (14-h.p. Renault) ... | 26.9 | m.p.g. | 0.438 |
| H. H. J. Burke (14-h.p. Spyker) ... | 27.2 | " | 0.444 |
| Dr. Minchin (8-h.p. De Dion) ... | 28.9 | " | 0.63 |
| G. H. Gill (10-h.p. Victoria) ... | 28.9 | " | 0.65 |
| J. F. Kimber (8-h.p. Rover) ... | 28.6 | " | 0.581 |
| Dr. G. Hall (8-h.p. Rover) ... | 32.4 | " | 0.588 |
| W. G. Crothers (9-h.p. Darracq) ... | 30.6 | " | 0.639 |
| A. King (16-h.p. Rover) ... | 20.1 | " | 0.649 |
| R. S. Robertson (10-h.p. Siddaley) ... | 22.4 | " | 0.675 |
| Col. Swaine (9-h.p. Cadillac) ... | 20.5 | " | 0.837 |
| E. E. Pulman (16-h.p. Aries) ... | 14.5 | " | 0.92 |

The competitors were hospitably entertained by Col. Fairtlough, chairman of the club, from whose house the start took place, and who acted as judge in conjunction with Mr. O. O. Wrigley.

INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

BEFORE the Incorporated Institution of Automobile Engineers, on the 8th inst., Mr. J. S. Napier read a paper on a system of cost, book-keeping, and records suitable for a motor-factory. He defined the objects of correct costing as:—(1) To determine quickly whether a profit is being made on the business or not. (2) To determine the cost of manufacturing an article, series of articles, or an order as a whole. (3) To determine the cost of each operation or series of operations on a given article, and by comparison find out which method of doing the work is the most profitable; it will be seen that having this information (and as all manufacturing is made up of only a few simple operations on each piece), it is possible to estimate the cost of other or similar work which may be required to be made in the future.

A list of symbols for materials and for operations was given, as well as those for Standing Shops Orders; the checking of time cards by means of clock recorders explained, and various useful tables, &c., were suggested with a view to facilitating the commercial side of industrial work.

The second general meeting of the graduates' section of the London branch of the above institution was held on Tuesday of last week. The chair was taken by Mr. Leslie H. Hounsfeld, and the debate was opened by Mr. Percy Bishop on the side of live axle, Mr. D. M. Power taking the side of chain drive. In the discussion Messrs. Eric C. Smith, L. H. Hounsfeld, P. Jones, W. Hooper, G. C. Taylor, C. E. House, H. V. Hutt, G. Wickham, T. E. B. White, and C. Thomas took part.

MOTOR.

THE enterprise of the Committee of the Motor Club in securing the s.s. "Princess Beatrice" together with a good position to view the Varsity Boat Race, on Saturday, was rewarded by the great demand for tickets. The boat had more than its full complement, and many members had to be refused.

THE CYCLE AND MOTOR TRADES BENEVOLENT FUND.

THE monthly meeting of the Executive Committee was held on the 1st inst., Mr. E. M. Mayes in the chair, when the treasurer reported a balance of £510 in the bank. Fifty-one subscribers, ten members, and one life member, were elected.

Sums of money were granted in six cases to subscribers, one of whom is in a sanatorium, three had already been in receipt of relief for some months, and in one case a sum of money was voted to pay for the funeral expenses of a child that had died.

The Organizing Committee announced that the preliminaries for the formation of a Glasgow centre were in good hands, and that arrangements were on foot for the formation of a centre in Edinburgh; also that a number of consults were being appointed in the London district preliminary to dividing the metropolitan area up into postal districts, each having its own centre committee.

Mr. A. J. Wilson, of 154, Clerkenwell Road, London, E.C., is the honorary secretary and treasurer.

LEWISHAM.

THE open handicap hill climb of the Lewisham A.C. for motor-cycles was held on Carter's Hill, Underriver, Kent, on Saturday, H. B. Renner being hon. secretary and clerk of the course.

There were fourteen entries in the class for motor-cycles with single-cylinder engines; eleven in the class for cycles with two or more cylinders; five for light weight motor-cycles not exceeding 95 lbs. in weight; one for motor-cycles with side car attachment, and three for passenger motor-cycles.

The fastest time was credited to G. L. Evans on a 3½-h.p. Rex motor-cycle in the single-cylinder class, and in the twin-cylinder handicap F. Applebee, jun., F. W. Applebee, sen., and O. C. Godfrey did fastest times, all on 5-h.p. Rex cycles.

SCOTTISH.

THE annual general meeting of the club was held on Monday, in Glasgow, with Mr. Henry M. Napier in the chair. In submitting the annual report the chairman drew attention to the satisfactory progress which had been made by the club during the past year, the membership now being 1,048 and the cash in hand at January 31st last being over £2,000. He referred to the work of the club in connection with applications by local authorities for speed limits, and pointed out the satisfactory results in numerous cases.

Sir J. H. A. Macdonald, K.C.B., Lord Justice-Clerk of Scotland, was re-elected president of the club, and Mr. J. Stewart Cowans, O.A., Edinburgh, as auditor for the ensuing year.

The following gentlemen were elected to the General Committee:—

Messrs. John Adam, Dr. Adam, Dr. Wm. Allen, Professor Barr, Dr. Blair, Major John Craig, A. Hunter Crawford, J. B. Talbot Crossbie, Wallace Fairweather, A. W. J. Fergusson, Major Jas. W. Fraser, E. Graham Guest, Henry E. Gordon, Sir Duncan E. Hay, Bart., John M. Hendry, Jas. W. Hunter, J. H. Irons, D. P. MacLagan, Geo. Macmillan, Andrew Melvin, T. Blackwood Murray, John S. Napier, Henry M. Napier, Jas. R. Nisbet, Geo. F. Paisley, J. H. Paterson, H. Prosser, John Reid, Wm. Reid, C. Basil Richards, John M. Ross, J. B. Shanks, Thos. Shaw, W. L. Sleigh, Robert J. Smith, Professor Stanfield, Thos. Symington, Dr. Dawson Turner, Wm. Weir, and John Wilson.

At a meeting of the General Committee at the close of the general meeting the following elections were made:—Chairman of the General Committee, Mr. John Adam, of Larchgrove; Vice-Chairmen of General Committee, Mr. Henry M. Napier, Mr. John Wilson.

It was agreed to ask the Marquis of Tullibardine and the Right Hon. A. J. Balfour to accept the office of vice-presidents of the club, and Mr. Robert J. Smith was re-appointed secretary.

The report of the general committee of the Scottish A.C., which was submitted to the Club at their meeting on Monday, showed a membership for the year ending January 31st of 965. Since the close of the financial year eighty-three further new members have been added. The cash balance was £2,245.

Reference was made to the various inquiries which had been held concerning speed limit applications, legal defence of members undertaken by the Club, the work of the Touring Committee, which included the appointment of 136 hotels and sixty-seven repairers, and the expenditure of £500 on road signs, warning signals, and the like, disciplinary action with regard to complaints of inconsiderate driving of motor-cars and the affiliation with regard to the R.A.C.

THE Newcastle Motor Club will hold a speed-judging competition at Belsay on Good Friday.

THE Acorn Hotel, Temple Street, Birmingham, is now the headquarters of the Birmingham M.C.C.

THE Barnoldswick Motor Club has just held its inaugural run. Mr. Fred Baldwin, the local postmaster, is the hon. secretary, and the membership already numbers about thirty.

In spite of the weather, which was both cold and wet, there was a good muster of the Junior A.C. members for the club's opening run to Bognor on Saturday. Some went down in the morning in order to have a day by the sea, the remainder arriving at the Royal Norfolk Hotel, where accommodation had been arranged, in time for dinner. Sunday morning was spent at Bognor, and after lunch the return trip was made via Pulborough, with a stop at Burford Bridge for tea.

AUTOMOBILE ACCIDENTS.

LAST week we reported an accident in Hertfordshire, when a motor-car was alleged to have knocked down a woman with fatal results. At the inquest the doctor said that the fractures were consistent with being struck in the back by a motor-car lamp, and the coroner advised the jury to return an open verdict, which they did.

AN unfortunate accident has occurred at Walmer, a collision having taken place between the motor-car of the Rev. H. Ellison, rector of Hothfield, and a bicyclist. Mr. Ellison applied the brake and ran up the kerb to avoid the mishap, and it was largely owing to his presence of mind that the accident was not more serious.

THE Daimler Motor Company, who are steadily developing their foreign trade, have just issued a French catalogue giving full particulars and illustrations of the various types of vehicles, which should be of assistance in extending their business in France.

INTERNATIONAL TOURING CAR TRIAL.

As in the case of the Commercial Vehicle Trial, a separate department has been formed by the R.A.C. in order that the work may be efficiently carried out. This department is located at 112, Piccadilly, W. Entries at double fees will be accepted until Tuesday next.

The following gentlemen have been nominated as judges by the Trial Committee:—Capt. F. E. Dyke Acland, Mr. G. H. Baillie, Capt. R. K. Bagnall-Wild, R.E., Mr. W. Worby Beaumont, Major T. H. Cochrane, R.E., M.V.O., Mr. F. C. A. Coventry, Mr. E. H. Cozens-Hardy, Lt.-Col. R. E. B. Crompton, C.B., Col. H. C. L. Holden, R.A., F.R.S., Mr. Wilson Noble, Mr. Mervyn O'Gorman, Mr. J. Lyons Sampson.

The 20-h.p. and 30-h.p. White steam cars entered by Mr. Frederic Coleman, and a 35-h.p. Benz car, entered by Benz et Cie., have not yet been classified; otherwise the classification of 151 entries is as follows:—

CLASS 1.—(Cars up to 6.4-h.p. R.A.C. rating).

Entrant. Car and stated h.p.

De Dion-Bouton (1907), Ltd. ... 8-h.p. De Dion-Bouton.

CLASS 2(a).—(Cars from 6.4 to 9.4-h.p. R.A.C. rating).

Morgan and Co., Ltd. ... 9-h.p. Adler.

CLASS 2(b).—(Cars from 9.4 to 13-h.p. R.A.C. rating).

Anglo-American Motor-Car Company ... 10-h.p. Cadillac.

British Automobile Commercial Syndicate, Ltd. ... 10-13-h.p. Zedel.

CLASS 3.—(Cars from 13-16-h.p., R.A.C. Rating).

De Dion-Bouton (1907), Ltd. ... 12-14-h.p. De Dion-Bouton.

Singer Motor Company, Ltd. ... 12-14-h.p. Singer.

Star Motor Company, Ltd. ... 12-h.p. Star.

British Automobile Commercial Syndicate, Ltd. ... 15-18-h.p. Zedel.

Capt. J. D. Johnstone ... 15-18-h.p. Zedel.

S. Straker and Squire, Ltd. ... 12-14 h.p. Straker-Squire Shamrock.

CLASS 4.—(Cars from 16 to 20.8-h.p., R.A.C. Rating).

Humber, Ltd. ... 10-12-h.p. Coventry Humber.

Vauxhall Motors, Ltd. ... 12-16-h.p. Vauxhall.

Clement-Talbot, Ltd. ... 15-h.p. Talbot.

Panhard and Levassor ... 15-h.p. Panhard.

Panhard and Levassor ... 15-h.p. Panhard.

Hillman-Coatalen Motor Car Company ... 12-15-h.p. Hillman-Coatalen.

Daimler Motor Company (1904), Ltd. ... 20-h.p. De Luca-Daimler.

Daimler Motor Company (1907) Ltd. ... 20-h.p. De Luca-Daimler.

Belsize Motors, Ltd. ... 14-16-h.p. Belsize.

CLASS 5.—(Cars from 20.8 to 25.6-h.p., R.A.C. Rating).

Humber, Ltd. ... 15-h.p. Coventry Humber.

Humber, Ltd. ... 20-h.p. Beeston Humber.

Brown Bros., Ltd. ... 25-30-h.p. Brown.

Clement-Talbot, Ltd. ... 20-h.p. Talbot.

Panhard and Levassor ... 18-h.p. Panhard.

H. M. Hobson, Ltd. ... 20-30-h.p. Nagant-Hobson.

Star Engineering Company, Ltd. ... 16-h.p. Star.

Bertelli, Wayman and Armfelt ... 20-24-h.p. Junior.

Minerva Motors, Ltd. ... 18-h.p. Minerva.

J. I. Thornycroft and Company, Ltd. ... 18-h.p. Thornycroft.

CLASS 6.—(Cars from 25.6 to 32.4-h.p., R.A.C. Rating).

Humber, Ltd. ... 30-h.p. Beeston Humber.

Ariel Motors, Ltd. ... 25-30-h.p. Ariel.

Deasy Motor Car Manufacturing Company ... 25-h.p. Deasy.

Belsize Motors, Ltd. ... 28-h.p. Belsize.

Morgan and Company, Ltd. ... 30-h.p. Adler.

CLASS 7.—(Cars from 32.4 to 40-h.p., R.A.C. rating).

S. F. Edge, Ltd. ... 40-h.p. Napier.

Daimler Motor Company (1904), Ltd. ... 38 h.p. Daimler.

Daimler Motor Company (1904), Ltd. ... 38-h.p. Daimler.

Hillman-Coatalen Motor Car Company, Ltd. ... 25-h.p. Hillman-Coatalen.

Sir W. G. Armstrong, Whitworth, and Co. ... 40-h.p. Armstrong-Whitworth.

CLASS 8.—(Cars from 40 to 46.4-h.p., R.A.C. rating.)

Ariel Motors, Ltd. ... 30-40-h.p. Ariel.

CLASS 9.—(Cars from 46.4 to 52.8-h.p., R.A.C. rating.)

Rolls-Royce, Ltd. ... 40-50-h.p. Rolls-Royce.

Rolls-Royce, Ltd. ... 40-50-h.p. Rolls-Royce.

| Entrant. | Car and stated h.p. |
|---|----------------------------|
| Deasy Motor Manufacturing Company, Ltd. ... | 35-h.p. Deasy. |
| Sheffield-Simplex Motor Works... | 45-h.p. Sheffield-Simplex. |
| Jarrott and Letts, Ltd. ... | 60-h.p. Lorraine-Dietrich. |

CLASS 10.—(Cars from 52.8 to 60-h.p., R.A.C. rating).

| | |
|--------------------------|-------------------|
| S. F. Edge, Ltd. ... | 60-h.p. Napier. |
| Milnes Daimler, Ltd. ... | 60-h.p. Mercedes. |
| Ariel Motors, Ltd. ... | 40-50-h.p. Ariel. |

In the "Morning Post" of Tuesday, Mr. H. Massac Ruist gave a tabulated statement showing to what proportions the motor trade will be represented in the forthcoming trial.

His figures show 153 different makes of cars represented in this country, 103 of which are not included in the entries to date for either the R.A.C. or Scottish A.C. tests. Only twenty-one makes of cars will figure in both trials, forty-one will participate in the Scottish event alone, and thirty-one have been entered only in the R.A.C. trial.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.

There were thirty cases at Kingston Police Court on Thursday, April 2nd, and fines were inflicted ranging from £5. In one case, where Lieut. Rupert Williams was summoned for driving in a manner dangerous to the public, Mr. Frampton put in a strong defence, but the Bench convicted and fined him £10 and costs. There was a summons against Mr. Taneborne, driver to Colonel Sutherland, for committing an offence under the Motor Car Act at Cobham, but Mr. Staplee Firth,

Mr. W. M. Letts at the wheel of the new 12-h.p. Daimler.

The new vehicle, which has been submitted to exhaustive trials by Messrs. Jarrott and Letts, has a single-cylinder engine of 120 mm. bore by 120 mm. stroke.

who appeared for the defence, secured a dismissal. This was the only case out of the thirty that was dismissed.

DANGEROUS DRIVING.

Ignatius Dracopoli, of the Ritz Hotel, London, was on Monday fined £20 by the Haywards Heath bench, who also suspended his licence for one month, for dangerously driving a motor-car on the Brighton road at Slaugham.

The magistrates expressed their determination to put a stop to fast motoring on Sundays over dangerous cross roads. Notice of appeal was given.

EXCEEDING THE LEGAL LIMIT.

For driving a motor-car at thirty-one miles an hour, an official of the Motor Union has been fined £2 at Guildford.

On Monday five motorists were fined by the Arundel County magistrates for exceeding the legal limit in the parishes of Walberton and Poling.

At Steyning Petty Sessions, on the same day, three London motorists were fined for exceeding twenty miles per hour on Ashington Common, in the parish of Washington.

As an evidence of the wear-resisting qualities of Rover gears and differential the Rover Company, Ltd., of Coventry, have sent us a photograph of the gear portion of an 8-h.p. Rover in the possession of Miss Dorothy White. The car was bought in May, 1906, and since that date has averaged from 200 to 300 miles weekly. It was taken down at the Bridgnorth Garage a little over a month ago, and the report was given that the vehicle was in splendid condition, the gears showing not the slightest sign of wear.

FORTHCOMING EVENTS.

APRIL.

- 11th (Sat.).—Annual open Flexibility Contest of the Crystal Palace A.C. Opening meeting of the Nottinghamshire A.C. at Edwinstowe. Sheffield A.C. meet the Rotherham and Workson sections at Barlboro at 3.30 p.m.
- 12th (Sun.).—Run to Cambridge of the Essex M.C., the Walthamstow M.C., and the Western District M.C.
- 16th (Th.).—Leicester A.C. at Ashby-de-la-Zouch.
- 16th—20th.—Easter Tour of the Motor Cycling Club.
- 17th (Good Friday).—Lincs. M.C.C. meet at Mablethorpe. Meet of the Leeds, Newcastle, Sheffield, and Bradford M.C.C.'s at Richmond.
- 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.
- 20th (M.).—Hull A.C.C. and Scarborough M.C.C. at Bridlington.
- 25th (Sat.).—Open Motor-Cycle Hill Climb of the Hertfordshire C.A.C. Opening meet of the Yorkshire A.C. at the Hotel Majestic, Harrogate.
- Quarterly trial of the A.C.U.
- 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F.
- 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Epping.

MAY.

- 2nd (Sat.).—Impromptu pace judging competition of the Sheffield A.C. at Ollerton.
- 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
- 10th (Sun.).—Targa Florio Race.
- 16th (Sat.).—Fifty miles Consumption Trial of the Hertfordshire C.A.C. Liverpool A.C.'s opening meet of the season.
- 21st (Th.)—25th.—Reliability Trial of the Irish A.C.
- 23rd (Sat.).—Clipstone race meeting of the Notts A.C. Meeting of the Yorkshire A.C. at Helmsley. Meet of the Motor Union at Lincoln.
- 25th (M.).—Industrial Vehicle Competition of the A.C. de France.
- 28th (Th.).—Visit of the Aero Club to Aldershot.
- 30th (Sat.).—Meet of the Herts C.A.C. at Hatfield Park.
- 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
- 5th—6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
- 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
- Start of the International Touring Car Trial of the R.A.C.
- 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
- 13th (Sat.).—Hill climb of the Notts A.C. at Oakhamoor. Speed Trials of the Lincs. A.C. at Grimsthorpe.
- 15th—19th.—Scottish Reliability Trial.
- 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
- 27th (Sat.).—Hill climb of the Midland A.C. at Shelsley Walsh. Saltburn beach races. Buxton meet of the Manchester and Lincolnshire clubs. Members of the Cheshire A.C. will participate in the Gymkhana of the Manchester A.C.
- 28th. (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
- 6th (M.).—Grand Prix A.C.F. (Voiturette section).
- 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
- 11th (S.).—Provincial meet of the R.A.C. at Hereford.
- 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
- 18th (Sat.).—Annual Gymkhana of the Herts C.A.C. at The Grove, Watford, by permission of the president, the Earl of Clarendon.
- Meet of the Liverpool and Cheshire A.C.'s at Delamere.
- 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club.
- Annual Open Hill Climb of the Midland A.C.
- 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

AUGUST.

- 29th (Sat.).—Meet of the Lincolnshire Motor Club at Lincoln.
- 30th (Sun.).—Southend M.C. run to Great White Horse Hotel, Ipswich.

SEPTEMBER.

- 5th (Sat.).—Aston Hill climb of the Herts C.A.A.
- 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

LIGHTING-UP TIMES—LONDON.

Secretaries of automobile clubs are invited to forward their programme of fixtures as soon as arranged.

ROAD REPORTS.

ILFORD.—On Sunday the police inaugurated a timing arrangement over a distance of some 240 to 280 yards in the High Road, Ilford. It was worked between Richmond Road and the end of the limit (Sunnyside Road). Two members of the West Essex A.C. were in attendance during the morning, and stopped many cars in time to warn the drivers.

PUTNEY.—The Wandsworth Borough Council has decided to adopt the suggestion of the Police Commissioner that a signpost should be erected warning drivers of motor-cars approaching the dangerous crossing at the Junction of Upper Richmond Road and Roehampton Lane, Putney.

BELFAST.—The annual report of the Belfast centre of the Irish Roads Improvement Association is a record of good work done, and reference is made to the improvement which is noticeable on most of the thoroughfares in the city and also the roads leading out of it.

A CHAUFFEUR EXONERATED.

At the Central Criminal Court, John Kitchener, motor-car driver, of Loudoun Mews, Loudoun Road, South Hampstead, was charged on the 1st inst., on a coroner's inquisition, with the manslaughter of Charles Cox. The latter was acting as flagman to a steam-roller on Cherry Tree Hill, when he was knocked down by a motor-car, driven by the accused, and received injuries from which he died. Mr. Arthur Gill, who appeared on behalf of the Public Prosecutor, stated that the Grand Jury had thrown out the bill against the accused, and in the circumstances it was not proposed to offer any evidence against him on the coroner's inquisition.

By direction of the judge, the jury returned a formal verdict of not guilty, and Kitchener, who had been on bail, was discharged. Mr. Justice Walton said he was satisfied that there was no reason for thinking that this accident arose from any culpable negligence on the part of the accused, otherwise the case would have proceeded.

BUSINESS NEWS.

LAST week a man entered the premises of the Hyde Park Motor Stores, 18, Brompton Road, London, S.W., and stole a pair 870 by 109 non-skid covers. He was unobserved, and the loss should suggest the necessity of increased watchfulness on the part of those in charge of such establishments in London, as the incident is by no means an isolated one. Police court proceedings are now being taken against three men in connection with the theft.

THE catalogue of motor accessories for 1908 issued by Messrs. Benetfink and Co., Ltd., Cheapside, London, E.C., extends to 120 pages, and will be of interest to motorists in the City.

MESSRS. MARKT AND Co. advise us they have recently considerably reduced the price of the Veeder hub odometer.

THE United Motor Industries, Ltd., who have taken up the agency for the Non Fluid oils, which have long been favourably known in America, have issued an attractive circular from their Poland Street (London) branch, which will doubtless be of interest to our readers.

AFTER exhaustive tests of the various makes of tyres the War Office have placed their contract for tyres with the Avon India Rubber Company, Ltd., Melksham, Wilts., the manufacturers of these well-known British tyres. This is a significant tribute to their strength and endurance, as the demands of military tyres are perhaps as severe a test as it is possible to make.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, APRIL 18, 1908.

[No. 476.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

NEW rules continue to come from the track at Weybridge, where good motoring sport is promised this Easter. The latest Supplementary Regulation suggested by the B.A.R.C., and formally approved by the Royal A.C., is to the effect that "every driver or mechanic taking part in any race shall be a male person, unless the race proposition expressly states otherwise." This, apparently, is an intelligent anticipation of the possible invasion of the track by lady drivers, and is following the regulation of the International Touring Car Trial, which excludes ladies from participation therein. The regulation appears somewhat hard on those fair motorists who have attained distinction in the arduous Scottish Trials of the past, but, on the whole, has been accepted by the bulk of competitors without protest. The extension of the rule to the track will secure even more universal approval.

Canadian and British Motor Laws Compared.

CANADIAN motorists are much exercised as to the future of motor legislation in the Dominion, and one or two points of difference in the existing law there, as compared with that in operation in this country, may be of interest. The registration of the car in Ontario is an annual event, the fee being four dollars for the first year and two dollars for subsequent periods. When the owner disposes of his automobile the registration of the same goes with the machine, the transfer being recorded with the authorities for a fee of one dollar. Speaking generally, the regulations follow the laws in vogue in this country, but the owner of the motor vehicle is, in the Canadian province, held responsible for any violation of the Act in which his car is concerned. No motor-car there is allowed to carry a search-light, and the maximum speed in cities and villages is ten miles an hour; outside such centres of population the maximum speed limit is fifteen miles per hour. After three convictions for certain offences connected with the speedy driving of motor cars, terms of imprisonment are imposed without the option of a fine.

A Visit to India.

NOT for a long time have we attended such an agreeable function as that which was held in London on Monday evening, when a number of representatives of the Press and of the agents of the Standard Motor Company, Ltd., met at dinner to meet Mr. Charles Friswell on his return from his four months tour in India, Burmah and Ceylon. As one of the oldest motor agents in the country Mr. Friswell is already well known as an enterprising man of business, to which, if we may judge from the way he interested the visitors in an account of his travels for upwards of two hours, he could now add that of a popular lecturer. In an inimitable free and easy style, which it is impossible to reproduce in cold type, he recounted some of the novel impressions of a first visit to our Eastern Dependency—among others, how he found that the hotels did not provide beds and how he could hire a man-servant at from 2d. to 3d. a day,

this not including board and lodging! From Bombay he took us, in his story, to Agra, with its marvellous temples, and afterwards to Delhi, Cawnpore, Lucknow, Benares, the great religious centre, and Calcutta, which latter he described as a business city so dirty that rats seemed to have first call on the hotel bedrooms. From Calcutta Mr. Friswell sailed to Rangoon, in Burmah, and thence by water proceeded to Ceylon, an island the beauties of which he considers are beyond comparison.

The Standard Car.

TURNING from pleasure to business Mr. Friswell afterwards briefly recounted how he had become associated with the Standard Motor Company, Ltd., and claimed that his long connection as a motor agent placed him in a special position, as a motor-car manufacturer, to realise the requirements of "brotheragen's." Every effort was being made to render the Standard cars, not only of the highest grade, reliable and simple, but to turn them out at prices well within the limits of modern buyers. He then outlined certain detailed improvements that have recently been effected in the chassis, and wound up with stating that as a result of his trip to India the seeds had been sown which should quickly make the Standard car one of the most popular in that great country. Altogether Mr. Friswell's story of his trip to the East was of absorbing interest.

Motor Cabs in London.

SOME commonsense regulations have been framed and came into operation on Wednesday in connection with the motor-cabs now plying for hire in London. It is provided that where motor-cabs are standing in "ranks" the drivers of the first two must be with their cabs and be ready to be hired at once by any person. Those cabs behind on the "standing" must move up as vacancies occur. It is further provided that no disabled vehicle shall remain on the rank unless the repair can be made at once. Should the disablement not be of such a nature a notice must be at once placed on the cab to the effect that it cannot be used and will be removed for repair.

The Restriction of Speed.

SOME of those authorities that in the earlier stage of their automobile knowledge obtained Orders for the restriction of the speed of motor vehicles through their areas are apparently reconsidering their decisions—a fact which should be noted not only by other authorities which may be in danger of hasty acceptance of suggestions for the restriction of speed, but also by those who have charge of the motorists' case in Parliament. One of the Scottish County Councils is seeking to secure the cancelment of its speed restriction order, and at the next meeting of the Glossop Town Council the rescinding of a resolution in favour of a speed limit lower than that recognised by Parliament will be fully discussed. At the 1st meeting the matter was raised, when it was pointed out that there were many reasons to be urged against a ten-mile speed limit for the town. This was a slower speed, one gentleman pointed out, than that at which a horse trotted, or about half the rate at which the tramcars travelled, and was actually two miles an hour less than a good runner could do in the time. More

over, the Motor Car Act was quite able to deal with these drivers who endangered the lives of the people without regard to any such extraordinary application to the Local Government Board.

Motoring Bishops.

MANY of the Bishops whose dioceses are of a rural character, with parishes at long distances from each other, have been thoughtfully provided with motor-cars, enabling them to thoroughly conduct their visitations with the maximum of human comfort and the minimum of human labour. In this way the Bishop of Southwell is now enjoying the ease of motor travel recently provided by his friends around Nottingham. Now comes the turn of those responsible for the ecclesiastical oversight of urban and town districts. Following the examples of the friends of the Bishops of Liverpool and Newcastle, those who have admired the good work done by the Rev. C. G. Lang as the Bishop of Stepney have provided him with a motor-car, rendering him independent of the inconvenience of London suburban stations and enabling him to get to many more meetings than would otherwise be possible. An old friend of the Church in East London has promised an annual sum sufficient for its main-

The Bishop of London in the 14-20-h.p. Renault Landauet just supplied to him by the Motor Supply Company, Ltd.

The carriage is a very handsome one, being painted dark purple, and is fitted with all the latest contrivances. The coachwork is by the Connaught Motor and Carriage Company. The Bishop has now disposed of all his horses and carriages, and will in future use motor-cars only.

tenance. In accepting, the Bishop expresses his hope that it may enable him to do his work in the East-end with less strain to himself, and with greater usefulness to the Church and the people. This week, also, we are able to prove the motoring interests of the Bishop of London.

Motor-car Imports and Exports.

MARCH proved another quiet month as far as imports of foreign motor-cars and parts into this country are concerned, a decrease, as compared with March, 1907, of £62,346 being recorded. Of complete cars only 433 were imported during the month, of the value of £155,157. The number of chassis imported was 282, valued at £79,525, while parts were responsible for £142,502, giving a combined total for March last of only £377,178, as against £439,524 in the corresponding month of last year, and £415,650 in March, 1906. The gross imports of cars (1,111 in number), chassis (750), and parts during the first quarter of the current year amounted to £998,063, as contrasted with £1,164,767 in the corresponding period a year ago. Turning now to the section relating to the exports of British automobile productions, these again also show a slight decrease—from, in the aggregate, £110,594 in March,

1907, to £104,006 last month. Altogether 182 complete cars (£65,461) and 20 chassis (£6,195) were despatched from this country in March, as well as parts to the extent of £32,350. The gross shipments during the three months ending with March are returned at £311,128, which contrasts with £315,602 in the first quarter of last year.

A Run into Wales.

ONE of the most charming of the Easter tours likely to be enjoyed by the motoring clubs this year is that of the Liverpool Motor Club, the officers of which have arranged a four days' programme as follows:—

Friday (17th).—Start Glegg Arms, 11.30 a.m., Chester to Ludlow, about 90 miles.

Saturday (18th).—Ludlow, via Wye Valley to summit of Eisteddfa Gurig Pass (close to source of river Wye), and via "Devil's Bridge" to Aberystwith, about 95 miles.

Sunday (19th).—Aberystwith, via Barmouth, Pass of Aberglasslyn, Beddgelert, Vale of Gwynant, and Swallow Falls to Bettws-y-Coed, about 90 miles. Dolgelly is 78 miles from Liverpool, and early starters on Sunday may meet members there about noon, or at lunch at 1 p.m. at Barmouth, ten miles from Dolgelly.

Monday (20th).—Bettws-y-Coed, via St. Asaph, home, about 90 miles.

We have been anticipating the pleasures of this trip by dipping into Mrs. Rodolph Stawell's "Motor Tours in Wales and the Border Counties," just published by Messrs. Hodder and Stoughton. It is divided into five sections—Shropshire, North Wales, the heart of Wales, South Wales, and the Wye Valley, while seventy excellent photographs add to the interest of the volume. Many guide books, presumably for motorists, have been compiled by writers who have gone by rail, horse vehicle, and cycle from place to place. The contrast between books thus written and the present volume is decidedly in favour of Mrs. Stawell, whose sense of literary proportion is nicely gauged. She never wearies with hackneyed reiteration of "ivy-bound castles," and the like, but tells the story easily and well, and then—"we had a lovely run before us down the valley, but if we are prudent we will drive slowly in the neighbourhood of Corwen." Such sentences delight the heart of the motorist and prove of practical value to all who travel by road.

Following the Trials.

A MATTER of convenience to pressmen has been arranged by the Scottish Automobile Club in connection with that part of the forthcoming great trial which will run through their territory. They are making arrangements to secure for members of the Press accommodation on Free-lance cars, which will leave the official headquarters each morning to witness the hill climbs, or view interesting points on the route. Hitherto, those who have followed the trials in a journalistic capacity have been in the long procession and unable to depart from the official routine, with the result that many interesting incidents have been lost. The new policy of the Scottish Automobile Club is one that will commend itself to a good many people, and readers as well as writers should benefit therefrom.

A Trio of Provincial Meets.

THE Royal A.C. has arranged three provincial Meets for the present year, and the first of these will take place on the 9th prox., at Nottingham, where a cordial welcome will be given both by the municipal authorities and by the county gentry of the district, the latter being headed by the Duke of Portland. Hereford has also been selected for a provincial Meet, and the enthusiasm of the motorists in the Cider county has previously been so well shown that no doubt will be felt as to the reception there. The third gathering will open up comparatively new ground, for not since the Club, under its old name of the A.C.G.B.I., visited Cromer has the central motoring organisation journeyed into Norfolk. Towards the end of the present summer the R.A.C. will hold its third Meet at Norwich,

and, seeing the proximity of that place to Sandringham, it would seem to crown the efforts of the year if Royal presence could be added to Royal patronage on that occasion.

Anticipating the Dust.

ALREADY many residents in the villages on the great main roads are looking forward with some amount of perturbation to the return of the motor-car to the road in the large numbers usually associated with the spring and summer seasons. Not only is the matter receiving the consideration of rural and other councils, but in some districts public meetings are being held to discuss the alleviation of the nuisance in a practical way. At Forest Row, near East Grinstead, a few evenings ago, a meeting was held, with the Rev. A. J. Swainson in the chair, to consider the question of tarring the roads for the coming summer in preference to watering with a view to laying the dust. Last year the roads were treated in

will suggest a form of mental enterprise for the longer afternoons that are now upon us.

The Nomenclature of Villages.

If the plans of the United States Post Office department are carried out, it will no longer be necessary for motorists on tour to ask the name of a town. The 70,000 postmasters in the United States are to be instructed to add to the words "post office" on the signs which designate their respective offices the name of the town or hamlet in which the office is located. Those who have toiled along on British highways and byeways have often been inconvenienced by the lack of information as to the names and place where it should be prominently displayed, viz., at the Post Office. We believe it is a regulation of the British Post Office that the names of villages shall be conspicuously set forth; but neglect is frequently discovered by motorists who go farther afield. Insistence on such

Hill Climbing in the South of France.

A 24-h.p. De Dietrich was last week driven to the summit of La Turbie, near Nice, along the narrow winding mule track, which, in a distance of 2½ miles, rises about 1,640 feet.

this way, the County Council paying half the cost, the other moiety being raised by local subscriptions. Several speakers urged that this course should be repeated this year, and ultimately it was resolved to do so, a committee being appointed to carry out the work.

The Tow Rope.

CASES have lately arisen in Sheffield and one or other important provincial centres where accidents have happened to pedestrians not observing the presence of the second vehicle when endeavouring to pass cars which had others in tow on a long line. Sometimes they are tripped up by the connecting line with dire results to themselves. So serious has it become in the cutlery centre that the attention of the local Automobile Club has been called to the matter, and the committee is now inviting suggestions as to the best means of giving a warning that one car is towing another. This is a new problem that will have to be considered, particularly by trade firms, and probably its solution

names being displayed should become an international instruction to the postmasters of every country, as a matter of convenience to natives as well as to foreigners.

Lights on Vehicles in Scotland.

THE Lights on Vehicles (Scotland) Bill which has been introduced by Mr. H. A. Watt, supported by Mr. C. D. Rose as well as by members more particularly associated with the northern part of Britain, is based on the provisions already enforced on this side of the Tweed; hence the hope that its adoption by Parliament may not be long delayed, and uniformity thus secured in Great Britain with regard to the carrying of lights on vehicles at night. As we have previously shown, the Act in its application to England has not raised any difficulties worth consideration, and its extension to Scotland in the public interest should be only a question of time, and that a very short one.

SOME EMERGENCY REPAIRS.

BY E. T. HUMPHRIES.

BEFORE the advent of the cycle or motor-car those with more than ordinary intelligence knew little of nuts and bolts, or even which way to screw the former on to the latter, and the use of an adjustable spanner was a thing of untold mystery. Much water has, however, run under the bridge since then, and with the more general use of the motor quite a little army of automobile mechanics has sprung up. But such must not conclude that these elementary experiences make them engineers, and anything that will help and assist users to effect small repairs in their private garage with their own resources, or with the aid and use of the local workshop, will be of interest.

The old adage of "a stitch in time, &c.," was never more applicable than to self-moving vehicles, and oftentimes, after a little experience, more serious repairs may be undertaken, with the result that at the end of the year the cost of upkeep is much lower than would otherwise be the case, also an oversight during construction, which afterwards affects the efficient working of a car, may be corrected. Such an instance recently came under the writer's notice; the car in question was giving fairly good results, but the cylinders were not all running "true." The valves were looked to and the usual sources of trouble explored,

Motoring under Difficulties in Florida.—A Cleveland Car on the Indian River Prairie.

but without any appreciable improvement. A further examination revealed the fact that on the cylinder head of No. 3 the ribs (which were on all of them) had not been properly cleaned off, with the result that there was a feathered edge on each rib. These edges, being very thin, became red hot, owing to the heat from the explosion, and though the surface would be much less, it would, owing to the intense heat, act upon the gases similar to an overheated cylinder; the gases would, in coming into touch with these over-heated portions, expand to such an extent that the cylinder capacity for available useful gases would be reduced, and thus could not receive its full charge of forceable explosive mixture. The foregoing is not an isolated case of the kind known to the writer. The ribs being dressed off to a rounded even surface, the engine gave better results than it ever had done before.

A similar trouble arose with a Humber car, but from quite a different cause; an overhaul had been made, and the vehicle on being taken out ran well for about three miles, when it suddenly stopped. A superficial investigation was made to locate the cause, but without the desired result, and another car had to be sent for to take back the disabled

one. On arriving home everything possible was done; this performance was repeated three times, and on each occasion the car stopped identically at the same spot. This seemed so weird that a most careful research was made, and at last the cause of the trouble was found and attributed to the following: Magneto ignition was being used, and just prior to the first breakdown new plugs had been fitted; these had very large metal ends, through which were the usual apertures for the spark. These metal ends getting very hot and retaining the heat they caused pre-ignition, and so explosions would take place, in all probability, on the upward stroke instead of the reverse, and so this defect acted in a similar, but in an intensified form, as the feathered ribs referred to in the preceding experience. With new and smaller ended plugs the trouble ceased.

An engine with two combustion heads cracked with the frost was the subject of an interesting repair and one that required few tools. Being of a Continental make it meant much delay to obtain new ones, so it was then decided to attempt a good repair of the fractured cylinder heads. At that time the writer was instructing a number of improvers, and made this an example for demonstration. A hole was drilled at the farthest extent of each crack and tapped, and a stud screwed in level inside and out. The fractures were cleaned out and brazed, and the whole allowed to stand for some days, having been dressed over with salammoniac to assist corrosion. With another cracked combustion head in a De Dion car the repairs were effected by shrinking three narrow iron bands round the outside clear of the connections, the contraction of these bands which when cold would be a tight fit, effectually, to all appearances closed up each crevice, but, to run as little risk as possible, each fracture was rusted up with salammoniac. In both the foregoing cases the repairs were quite satisfactory.

Recently, the following happened near Aldershot, and the details of such experiences, with an account of the measures taken, may assist any user who should meet with a similar misfortune. When motoring with a 30-h.p. car, and wishing to save time, a bye-road was taken, when suddenly the car sunk into the ground and became firmly embedded. Every effort was made to move it either backward or forward under its own power, but without effect, and at each revolution the wheels ploughed themselves deeper into the mire. Failing to move it at all, two horses were obtained from a neighbouring farmhouse, but equally without favourable results. Leaving the car until the morning, trenches were cut behind each wheel, giving a gradual slope, some 9 in. by 3 in. planks being laid down up to each hind wheel. A screw jack was then placed under the axle immediately inside the rear wheel, and raised until the plank was pushed under the wheel. This was done with all four wheels. The earth under the car was cleared away, but it must be noted that this was not done until the wheels had their proper load, for, as usual in such cases, the differential was aground. The car was now easily moved out backwards under its own power.

A cracked steering wheel is not an unknown thing, and if such takes place *en tour*, in a part far removed from a repair shop, and unless the user can "engineer" a repair upon his own account, much delay and inconvenience may result. A break of this description happened to a car with the writer when recently in Scotland. The hub cracked right across, and to such an extent that the wheel revolved round the steering pillar without any effect on the front wheels. The only place where any repairs were possible was a blacksmith's shop about a mile away. The wheel was taken off and the writer took it to the shop. Finding a small odd plate of iron, he got the smith to heat it, and over the "hub" of a farmer's waggon wheel that was in for repairs to hollow it in the centre, through which a hole was drilled. As the tools available were very limited, there was no drill large enough to make the hole such that it would take the pillar, so a taper drift (bar of iron) was forced into the hole, which made it a nice fit on the steering pillar. Holes were drilled through the plate and each spoke; the whole riveted together with perfect success, so much so that up to the present it has not been thought worth while to obtain a new wheel. The whole operation only took some two hours to effect.

GOSSIP FROM PARIS.

NOTWITHSTANDING all the splendour of last year's Automobile Salon held in November there was something wanting, and that something was the presence of the usual crowd of English visitors. Why did they not attend the Show in the same numbers as on previous occasions? The Syndical Chamber of the automobile trade evidently thinks that the date had a good deal to do with it. At any rate it has just decided not to hold the Show again in November, but to revert to the old custom of opening it in the second week in December.

It was predicted that the crisis in the automobile industry would go on growing in intensity till the end of June. Fortunately the turn for the better has come sooner than was expected. The demand for new cars, though of course not so brisk as at this time last year, is nevertheless improving. There is another phenomenon which is worth noting. It is the demand for good second-hand cars. Till recently the sale of even the best second-hand vehicles was difficult. Now there is a brisk demand for them. It is reported that even several English intermediaries have come to Paris to buy good second-hand cars of medium horse power.

By his flight of 3,925 metres M. Delagrance last Saturday evening deserved and obtained an ovation from the crowd of spectators he certainly will never forget, and the hearty congratulations of all interested in aerial navigation. He is now the record man of flight, having beaten Mr. Henri Farman's performance by 1,920 metres 20 centimetres. Also the officially recorded time he remained in the air was 6 min. 30 sec., or 3 min. longer than Mr. Henri Farman. If he had not, unfortunately, just grazed the ground with one of the wheels of his aeroplane his performance would have been a distance of about 8 kilometres or five miles flown in 9 min. 15 sec. After shaking as many as he could of the hundreds of hands which were outstretched towards him M. Delagrance declared that when he landed he was utterly exhausted. He meant that the tension of mind had been so great that even if his motor had been able to hold out he could not have gone much further. The physical exertion of steering an aeroplane while looking after the motor is considerable, but the mental strain is yet greater. The "Flying Man" has to be more than all awake.

I HAVE an English friend who crossed the Channel for the first time in his life a few days ago. His admiration of the Ville Lumiere is somewhat tempered by his disgust at the condition of the Boulevards and streets. It is fortunate he arrived after the barriers enclosing about half the Place de la Concorde had been removed, otherwise I do not know what he would have said, especially if he had been told that they were there because the ground was unsafe even for a child to walk on. It is not, however, only the extraordinary number of thoroughfares half blocked with hoardings round the works for the construction of the Metropolitan Railway, &c., but the bad driving and the manner in which the traffic is regulated which astounded him. My friend could not find words strong enough to qualify the driving of the majority of the cabbies and their utter disregard for the pedestrians. Indeed, he witnessed with me a most unedifying scene on the Place Chateaudun. After nearly running over a lady and two children, a cabby whipped up his horse, which knocked a cyclist off his saddle. The unfortunate man just avoided being trampled under the horse's feet, but he did not escape the cabby, who slashed at him with his whip. How the matter ended I do not know, as our taxicab carried us quickly away.

THE driving of the taxi-cab chauffeurs was not much more highly appreciated by my friend than that of the cabbies, but it was the motor-buses which amazed him the most. And that is really not astonishing. Where the drivers were recruited and what orders they receive from their employers I cannot say, but

their recklessness, which is constantly causing most regrettable accidents, is undeniable. There are not more than a hundred motor-buses plying in the whole city, while there are at least ten times that number in London. Yet my English friend declares they make as much noise as all the London buses put together. Though France has the honour of being the cradle of automobilism, she has allowed herself to be surpassed by her neighbour across the Channel, at least in the way of buses. The fact that the concession in virtue of which the Paris Omnibus Company enjoys a monopoly will expire in May, 1910, and that the negotiations for its renewal have not yet been concluded, may have something to do with it. Not being sure of preserving their monopoly, the directors of the company refused until last year to listen to any of the proposals made to them for transforming their rolling stock.

WHEN, after long hesitation, they did at last announce their intention to give the Parisians motor-buses like those the Londoners have had at their disposal since 1904, everybody expected wonders. When they were put on the streets the vehicles were indeed wonders. The company having a large stock of three-horse omnibus bodies had ordered that the chassis should be made to fit those bodies instead of building appropriate bodies for the chassis. The result was naturally deplorable. The passengers perched up high on the knifeboard complained and continue to complain that the vibration and swaying is so strong

Mr. A. Morton, President of the Canterbury (New Zealand) Automobile Association, at the wheel of his 15-h.p. Humber Car.

they cannot even read a newspaper, and those inside declare they are cramped up and deafened by the rattling noise. Then there are the shopkeepers and proprietors of the houses along the routes taken by the buses. The small tradesmen in the narrow streets affirm that their goods are spoiled by the dust the heavy vehicles raise in dry weather and by the mud sent flying by them in wet weather. As for the landlords, many of them have already commenced legal proceedings against the omnibus company for the deterioration of their property from the repeated little earthquakes produced by the constant passing of the lumbering cars. No one demands their suppression, but everyone insists on reasonable modifications being made to obviate the inconveniences of the present vehicles.

THE Committee of the Chamber is showing great diligence. Taking into due consideration the indications of competent persons, it has demolished M. Barthou's Bill, and in doing so it has won the applause of all connected with the automobile industry and of M. Barthou himself. That is a phenomenon not often witnessed. But the Minister had the good sense to recognise he drew up his Bill without knowing much about the question. The amended, or, I might say, the new Bill will contain none of the objectionable stipulations referred to in the M.C.J., but it will be time enough to speak of the proposed measure when it comes on for discussion in the Chamber.

MARNEY.

B

A NEW NON-SKID DEVICE.

A FEW days ago we were afforded an opportunity of taking a short trial run on a light car to test the merits of a new and somewhat novel non-skid device which has lately been brought out by the Portman Garage, of Portman Mews North, Portman Square, London, W. As will be seen from the two illustrations given below, the arrangement consists of a long strip of leather, the two ends of which are suspended by the medium of springs from the frame of the car. The leather thus hangs down in the form of a loop, the extremity of the curve of which just touches the ground inside the wheel track. At this point the loop is provided with three or four short pieces of leather, furnished with steel studs similar to those of a non-skid band. As will be seen from the lower picture, these projections extend towards the road wheel, to which it presents a bevelled or wedge-shaped surface.

The idea of the device is that directly either of the rear wheels shows a tendency to skid it meets the leather grip, when all further sideways movement is arrested. The car on which we made the trial run was fitted with plain tyres, and, notwith-

standing that the driver did all he could to cause a skid by choosing a greasy road and occasionally applying the brakes suddenly, not once did the vehicle deviate from its proper course. We are not able to say how the device would answer on a heavy touring car, but, so far as light vehicles are concerned, it certainly appears to be an effective arrangement, and one which enables plain tyres to be used in place of the more costly non-skid variety; it adds but little to the weight of the car, and, being hidden behind the wheels, forms an inconspicuous yet useful safeguard.

MESSRS. S. F. EDGE, LTD., have brought out a new electric dashboard lamp which fulfils the double purpose of indicating whether the tail light for illuminating the number plate is alight or not, and also for reading indications on dials of clocks, speedometers, distance recorders, pressure gauges, &c. The light on the dashboard is coupled in series with the electrical tail lamp, so that, should anything happen to the latter which would cause it to go out, the light on the dashboard would similarly go out, and give an indication of the state of affairs to the driver.

MOTORING IN SOUTHERN INDIA.

TO undertake a journey of 230 miles, with short stoppages for breakfast, paying tolls and Custom House inspection, in a motor-car over rough and rocky roads full of ruts, deep holes, and unmacadamised, unlit by municipal lamps, in cloudy weather, and where human beings are few and far between, and to accomplish it without any accident, not even the running over of a "pi" or a country fowl for breakfast, is an enterprise which may not be devoid of interest to your readers. I, therefore, give the following particulars of a trip I recently made from Bangalore to Pondicherry and back. I left Bangalore early one morning—at 2 a.m.—with three up in an 8-h.p. Darracq. The weather was rather chilly, and the municipal lamps, which were a *dele noir* to the station, emitted a lurid light. We passed through Hosur over the ghauts to Krishnagherri, where the sun was seen rising, and next proceeded to Ootancari, and were stuck in the sand in crossing the two rivers. But this difficulty was soon tided over, and after breakfast we ran on to Teruvanamali by the well-known citadels of Gingee, now almost in ruins. Gingee, a city once of great historical importance, appeared to be thoroughly ugly, and cramped, squalid and uncomfortable and filthy. The streets through which we had to pass were reeking with uncleanness, and the houses or huts appeared to be built on one arbitrary plan—the ungraceful form of a dry goods box. The sides are daubed with a smooth white plaster, and tastefully frescoed above and below with discs of cowdung placed there to dry. This gave it the romantic appearance of having been riddled with cannon balls, and imparted to it a very warlike aspect. Grey lizards, those heirs of ruin, of sepulchres and desolation, glided in and out among the crumbling stones of the old fort, or lay still and sunned themselves.

From Gingee we proceeded to Tindivanam, Vanur, and thence to Pondicherry. Considerable difficulty was experienced in crossing the eight miles before entering the capital of the French possessions in the East. The roads are so abominably bad that, suffice to say, it took us an hour and a half to accomplish four miles. What might have terminated in an accident was happily averted. It was still dark when the car was about to enter the French boundary, when the tollgate man impeded the road by placing a pole to prevent carts passing (without a light). But for an electric lamp I was carrying the car would have dashed into the pole and caused some damage. This was exactly what occurred to another car which shortly followed. We arrived at Pondicherry at 7 p.m., thus accomplishing the journey in seventeen hours, inclusive of the stoppages referred to above and a detention of three-quarters of an hour at the custom house, for inspection of contraband articles. On this trip, it may be added, 10 gallons of petrol were used.

The return journey was accomplished with greater facility. Leaving Pondicherry at 3.30 a.m., to avoid the first few miles of bad roads, we took a cross country route by Tomb de Anglaise, Mailam, Vallam, getting on the high road near Gingee. Thence we made a straight run to Krishnagherri, where we had breakfast about noon, and returned to Bangalore, *via* Hosur, at 7.30 p.m. On the return journey only 7½ gallons of petrol were consumed. The trip may be considered to be a record one for this part of the world, as it was accomplished without any break-down or mechanical trouble, although the road near the ghauts is in a disgraceful condition.

G. J. INGRAM-COTTON.

FROM the Star Engineering Company, Wolverhampton, comes a copy of the new catalogue of Star cars which gives full particulars of these well-known vehicles. For the 1908 season five models are being built, viz., 9-h.p. two-cylinder, 12-h.p., 16-h.p., and 20-h.p. four-cylinder and 30-h.p. six-cylinder, with either chain drive or live axle as desired. In addition to a very complete description of each type, illustrations are given of the main components of the chassis, such as the engine, gear-box, live axle, &c. At the end several pages are devoted to letters from satisfied users of Star cars.

MR. C. E. PILCHER, of 16, Montem Street, Thorpedale Road, Tollington Park, London, N., has opened a motor repair shop.

MR. JOHN DRAKE, of the High Street, Egham, who has also an establishment at Englefield Green, undertakes the repair and maintenance of motor lawn mowers.

SOME days ago a motor-car was found unattended near the schools at Ottershaw. On being discovered it was towed to a piece of common land, where it remained two days until the police appeared on the scene. It has since transpired that it was driven from the direction of Chertsey and left by the roadside.

SPRINGLIKE weather favoured the races organised by the Royal Artillery at Aldershot on Wednesday, last week. The ground was kept by mounted men of the Royal Horse and Field Artillery, and several regimental coaches and drags were to be seen, while the place set aside for motor-cars was crowded.

AT Bow Street (London) Police Court, a chauffeur, who was fined for exceeding the speed limit for motor vehicles in St. James's Park, asked for time for payment. The magistrate said that if did not pay distraint would be levied. Had he any goods? Defendant: Yes, sir; a wife and six children. He was allowed time.

IN connection with the Cordingley Show, Automobiles de Luxe, Ltd., of 146, Offord Road, Liverpool Road, Islington, London, N., had a stand from which they were able to make known their facilities for the hiring of cars for pleasure and other parties—a branch of the automobile business that should soon present an encouraging expansion.

TRAMCARS and other vehicles propelled by horses have apparently experienced a slump during recent years. The trams are often to be found as poultry runs in rural districts, and at an auction sale of horses and omnibuses at Herne Hill, the maximum price realised for the vehicles was 5 guineas, the minimum being £3 15s. Horses were obtained at an average of 15 guineas each.

THE Isle of Wight Steam Packet Company are now conveying a limited number of cars between Southampton and Cowes daily by each of their ordinary passenger steamers, the 8.30 a.m. from Southampton and the 9.40 a.m. from Cowes excepted. They cannot, however, undertake to convey motor-cars on Bank Holidays, an exception which those who intend to motor that way at Eastertide should note.

THE sporting element in the motor world is apparently not confined to any one section, for a feature of the race meeting at Brooklands is the support which is being given to it by members of the second-hand car trade. For example, we learn that Messrs. Corry Hurford, Ltd., of Great Portland Street, London, W., have entered for two of the races, Mr. Hurford driving a 60-h.p. Mercedes in the Continental Stakes, and Mr. Adams a 6½-h.p. Griffon in the first motor-cycle race.

A GREAT automobile carnival was held in New York on the 7th inst. in celebration of the tenth anniversary of the commencement of motor-car building in America. Altogether close upon 2,000 cars joined in the procession, including vehicles of various ages and of every conceivable type. The procession was made up of five divisions, the first, which contained the oldest machines, being followed immediately by cars of the very latest type. In the third division were decorated touring cars, in the fourth commercial vehicles, the fifth and last consisting of advertising features.

A NEW record in the 90-h.p. class of the Brooklands Automobile Racing Club was established on Friday of last week, when D. Resta, driving a four-cylinder Mercedes (of 76-h.p. R.A.C. rating) covered ten laps of the course in 18 min. 37.75 sec. His speeds varied from 87.95 to 91.85 miles per hour; the time for the "flying half-mile" was 18.85 sec., which gave a pace of 95.49 miles per hour. Resta was well toward covering the fifty miles record when the bursting of his off-side front tyre compelled him to be content for the day with his half-mile and ten-laps achievements.

A NEW motor garage is being opened by Mr. Arthur Robertson at Aboyne—on the route of the Scottish Reliability Trials of 1906 and 1907.

THE works of Messrs. C. A. Vandervell and Co., at Warple Way, Acton Vale, London, W., will be closed from Thursday the 16th until Tuesday the 21st inst., over the Easter holidays.

ON Friday evening last the 18-h.p. Siddeley car fitted with Elastex filled Dunlop tyres completed 1,500 of its 3,000 miles trial under the official observation of the Royal Automobile Club. So far the trial has been entirely devoid of incident—simply a series of most enjoyable days' runs.

MR. SEEGER, who, in addition to being managing director of the Compania Mexicana de Vehiculos Electricos, is sole agent for Napier cars in Mexico, recently asked Messrs. S. F. Edge, Ltd., to build him vehicles capable of negotiating the roughest of roads and the steepest of hills. In stating his requirements Mr. Seeger drew a very vivid picture of the class of roads and hills which he had specially in mind, and went on to say that one car was destined for a potential customer who lived at a place called Tepic, on the West Coast of Mexico, and isolated from the rest of the country in that no railway has yet been constructed across the mountain range which runs north and south. Mr. Seeger's

client therefore commissioned him to purchase a car capable of crossing these mountains, and travelling on what are probably the worst roads in the world. A special colonial type of Napier six-cylinder car, constructed with the engine and all working parts carried high above the ground to admit of the vehicle traversing the roughest roads and fairly deep fords and other irregularities of the ground, was sent out. The photograph reproduced herewith shows the car half-way up the mountain pass of Cuesta de Ingenieros, en route across Mexico. It triumphantly surmounted all the difficulties of a long and arduous journey, and was delivered to its prospective owner, Don Faustino Somellera, in perfect running condition and to his entire satisfaction.

RECENTLY we recorded how a motor-car in the Fen district had narrowly escaped projecting its occupants into one of the dikes of Lincolnshire. Now comes news of a motor vehicle jumping a bank at the junction of the Birmingham Canal at Wednesfield and dashing down an incline into the water. Fortunately the driver, Mr. Henry Jones, of the Wolverhampton Works, Wednesfield, was able to fling himself from the vehicle just as it reached the water, from which he emerged with nothing worse than having had an uncomfortable ducking. Mr. Jones was approaching the bridge when a woman was seen walking in his way, and in order to avoid her he turned his car suddenly, with the result that he was carried over the embankment. After some difficulty the car was rescued from the canal.

MESSRS. W. AND H. KING, of 2, London Road, East Grinstead, are letting motor-cars out on hire.

THE MARQUIS DE MONZELY ST. MARS has purchased a 40-h.p. six-cylinder Napier for racing purposes at Brooklands during the coming season.

FACILITIES for the collection and delivery of parcels in the rural districts of Kent will be provided in connection with the new motor postal service to be established between London and Dover.

IN the new American-built Stearns car, a feature of the motor is that the crank case is cast with a bedplate across its forward end, which forms a support for the radiator, thereby taking the latter entirely away from the chassis frame and making it a unit with the engine.

IN the Back Fern Avenue, Newcastle-on-Tyne, a new garage is being opened under the style of the Jesmond Motor Works. The proprietors are Messrs. Robinson Brothers, who have another establishment in the Portland Road, Newcastle-on-Tyne, and who are well placed to be of assistance to local as well as visiting motorists.

AT Bournemouth, Mr. McAule has completed the improvements to his motor garage in the Holdenhurst Road. In addition to accommodation for over 100 cars he has sleeping accommodation for forty chauffeurs, so that visitors at that delightful resort will find every facility for having their vehicles completely under supervision during their stay.

REFERENCE has already been made in these pages to the pneumatic starting device lately brought out by the F. H. Smith Motor Accessories, Ltd., of Datchet. We are now able to give

an illustration of the apparatus, which is designed to be screwed on the dashboard, from which extends a small flexible pipe to the float chamber of the carburettor. Within the casing is a small piston, and by depressing the push button an increased atmospheric pressure is put upon the petrol

in the float chamber, and a larger supply is forced through the carburettor into the engine. It is claimed that not only does it replace the usual carburettor "tickler," but that, being an actual sprayer instead of a flooding arrangement, the usual trouble often experienced in starting a petrol engine is practically eliminated. Another important feature of the device is its value in instantly detecting the cause of missing or want of power in a motor while running on the road. If the lack of power is from want of petrol the engine will at once show the increased power because of the extra charge given by a stroke of the piston. On the other hand, if the want of power or missing be caused from electrical faults, the engine power will not be improved—in fact, an increase of petrol supply will tend to retard the engine if the charge is normal to commence with. The apparatus is neatly finished and can be easily fitted to any carburettor.

ON Saturday Queen Alexandra and Empress Marie motored from the station of Six Mile Bottom to Egerton House, on the outskirts of Newmarket. They were to have rejoined the train at Fordham at 5.25 p.m., but at nearly half-past six there were no tidings of the Royal party, and telegraphic inquiries failed to reveal their whereabouts. Mr. George Flanders, who had his motor-car in the station yard, was approached, and readily placed the vehicle at the disposal of the officials. Police Superintendent Winter, of Newmarket, was accordingly driven by Mr. Flanders in search of the Royal travellers, but, failing to locate them after proceeding a considerable distance, decided to return, and the royal cars arrived at the station from another direction at the same time over an hour late. The Queen on alighting was met by various officials, and her Majesty expressed her regrets that there had been a prolonged delay owing to a wrong road having been taken. It also transpired that a tyre of one of the Royal cars was badly punctured during the journey to Fordham, and an emergency cover had to be fitted before the car could proceed.

EARL AND COUNTESS CAIRNS, who have been lately staying at Pau, have gone for another motor tour through the South of France.

AT the City Motor Works at Elgin, Mr. A. Paterson has made considerable extensions for the coming season. His garage will have accommodation for between thirty and forty cars.

THE automobile battle of flowers which took place recently in the Jardine Public, Nice, was the most beautiful fête of the season. There were over fifty cars taking part in the battle, many of them being very beautifully decorated.

LYXAVON is a liquid soap for motorists introduced by Messrs. Sydney Maitland and Co., of Prospect Place, Barnsbury, London, N., the merits of which were amply demonstrated at Cordingley's Motor Show. It quickly brings about the desired effect, and has the advantage of being pleasant to use.

A CORRESPONDENT at Bangkok, Siam, reports that the trade in motor-cars and in motors to be placed in the hulls of locally-built boats remains extremely brisk, and hardly a week elapses without several cars and half-a-dozen motors for boats arriving at Bangkok. Many of the cars are French, supplied through the agency of British firms, but most of the boat motors are of British make.

SOME alarm was caused in Pall Mall on a recent evening when an alarm of fire was given at the old War Office buildings. It is understood that the cause of the outbreak was a spark from an adjoining chimney falling on some matting which was placed over the roof of the building, which is in the course of demolition to make way for the new clubhouse of the R.A.C. Considerable damage was done to the roof, which eventually fell in.

THE Car and General Insurance Corporation, Ltd., which has done much for motorists in connection with insurance matters, now issues an "unlimited" policy granting indemnity from damages through mechanical breakdowns, accidental injury to tyres, lamps, accessories, &c., insurance of paid drivers, medical expenses, damage by fire or explosion, accidental damage during transit by rail or water, loss of car and claims by the public.

A SIMPLE and yet troublesome difficulty occurred with a motor; a run of about ten miles had been taken without any disturbing element, but when an attempt to start on the return journey was made, the engine refused to run. After trying the usual things, a more minute examination was made of the carburettor, and quite a seating of water was found in the bottom; this was dried out and a start made. At first it seemed a puzzle how, even during a recent storm, this deposit could have got where it did, but on looking over the bonnet a small hole was found that solved the mystery.

MESSRS. MERCREDY, PERCY, AND CO., LTD., of 34, Lower Abbey Street, Dublin, and 516, Birkbeck Bank Buildings, High Holborn, W.C., have recently issued a new edition, making the fifth, of "De Dion-Bouton Motor Carriages: their Mechanism and How to Drive Them," by R. J. Mercedy. This book has been again brought fully up to date, so as to cover the new models of these vehicles introduced up to the end of the year 1907. It has been considerably increased in size, the idea of the author being to enable the user of any type of De Dion car, from the earliest to the latest, to find in the booklet answers to any question which may arise regarding the adjustment or repair of the car, of whatever age.

THE following census of motor vehicles was taken by Mr. R. B. Robertson from his office overlooking the Thames Embankment, London, between the hours of 10 and 11 on the morning of April 2nd. During the hour 391 motor vehicles passed along, these consisting of 223 taxicabs and 168 private carriages, comprising thirty-two different makes. The total of 168 was made up as follows:—Daimler, 26; Renault, 21; Panhard, 16; C.G.V., 11; Mercedes, 10; Electromobiles, 8; Delaunay-Belleville and Darracq, 7 each; Napier and De Dion, 6 each; J. and B., 5; Dennis, Argyll, Clement and Siddeley, 4 each; Talbot and F.I.A.T., 3 each; Deasy, Hotchkiss, Gregoire, Rochet-Schneider, Mors, Humber, Brasier and Lanchester, 2 each; Gobron-Brillie, N.E.C., Nagant-Hobson, Unic, Berliet, Prunel and Minerva, 1 each.

CONTINENTAL NOTES.

British Motorists in France.

Among the recent visitors to France from England are:—The Duke of Westminster, Major Cowes, Mr. Percy Wyndham (75-h.p. Mercedes), General Field (40-h.p. Mercedes), Major Cardwell (30-h.p. Renault), Col. W. H. Fergusson (30-h.p. Panhard), Sir John Gladstone (45-h.p. Siddleley) and Mr. and Mrs. Mosenthal (40-h.p. Delaunay-Belleville).

Electric Motor Fire Engines in Berlin.

About two years ago the municipal authorities of Berlin granted a sum of £2,500 for the purpose of experiments with self-propelled fire engines, and Herr Reichel, the chief of the fire brigade, decided to have a steam engine and an electrical vehicle built for the purpose. Both vehicles have been subjected to long-distance runs, and the results are embodied in a report recently issued by the chief officer. As far as the electric fire engine is concerned, Herr Reichel states that as a rule it made two journeys daily. The runs were not merely limited to the city and suburban districts, but were extended to numerous localities situated at a distance of from 22 to 25 miles from Berlin. For instance, journeys were repeatedly made to Oranienburg, Zossen,

King Edward in Spain.

On the 10th inst. King Edward, attended by General Sir Stanley Clarke, left Biarritz with a few friends in motor-cars for an excursion into Spain. The Royal party passed through Behobie, the last French village on the old post road from Bayonne to Madrid, then ascended the valley of the Bidassoa, the boundary between France and Spain, which they crossed near the historic Isle of Pheasants, the scene in 1659 of long international conferences which lasted for four months and culminated in the Peace of the Pyrenees. The island has become extremely narrow owing to the gradual encroachment of the water. The trip was continued through the Spanish plain to the village of Navarta. The return was made by the way of the Mana Pass and the Basque villages of Espelette and Cambo. The drive was favoured throughout by fine weather.

Miscellaneous Items.

It is reported that a new 65-h.p. Mercedes car fitted with a novel design of engine is about to be put on the market.—The first Renault motor-cab in Berlin was put in service on the 7th inst.—The French Automobile Club has decided to hold the annual event known as the Coupe de la Presse on the Dieppe

Record Breaking at Brooklands.—Rosta Preparing to Start on his Mercedes.

Bernau, Potsdam, &c. The principal object of these distant runs was to thoroughly test the motors and the battery on hilly and badly paved roads. The motors enabled the engine to mount all gradients admirably. During a single week in June, 1907, the vehicle covered a distance of 611 miles, that is to say, almost the same mileage as is traversed by a horsed steam fire engine on an average in a year—620 miles. The chief officer has now resolved, as a result of the experiments, to introduce electric fire engines for use in the inner parts of the city and the near suburbs, leaving steam motor fire engines for employment beyond those districts.

The A.C.F. Grand Prix Race.

It is announced that the Mors Company, after abstaining from races for some years, is building a trio of cars for this year's A.C.F. Grand Prix event, and that Jenatzy will probably be seen at the wheel of one of the vehicles, which will be fitted with four-cylinder engines, 155 mm. bore by 170 mm. stroke. Ignition is by low tension magneto, the clutch is of the Mors metal band type, and the transmission by a three-speed gear-box and side chains.

circuit on August 2nd, 3rd and 4th next.—The German Imperial Automobile Club recently held its annual meeting in Berlin, when it was announced that the Club has now nine life members, 1,210 ordinary members, forty-three lady members and 385 extraordinary members. The Club issued during the year 3,300 certificates to tourists wishing to cross the boundary under the tryptique system, against 1,800 the previous year.—The Dutch Automobile Club announces that it will probably this year replace its annual Scheveningen automobile week by a commercial vehicle and fuel economy test.—Considerable interest is just now being shown in a twin pneumatic tyre for industrial motor vehicles which is being developed by the Michelin Company.—The death is announced from Monte Carlo of M. Michel Werner, one of the inventors of the Werner motor-bicycle, at the early age of forty-six years.—A motor-bus service is shortly to be started between Fiume and Trieste, Austria.—A series of flying kilometre speed trials was held by the Algerian Automobile Club near Algiers on Sunday last. The best time of the day (29 sec.) was made by Gerin on a Renault.

Accessories for Spring Touring.

THE delightful weather of Monday—coming after a week-end which was dreadfully dull and cheerless in London—revived hopes for Easter touring, and has caused many a car to be overhauled in anticipation of pleasurable times in the country during the next few days. With the coming of Easter motor-cars will return to the road in increased numbers, and many motorists who have allowed their vehicles to remain in the garage during the winter will find several renewals in their equipment are required. In many cases these will not be obtained until Necessity drives them to the expense; but the wise person will take early care to acquaint himself with the conveniences and comforts brought out by firms who have specialised on the accessories of the automobile. Hence the review of such novelties which we give on the present occasion, reserving some other useful devices for reference in our next issue.

A New H.F. Vulcaniser.

Messrs. HARVEY FROST AND Co. have raised the practice of vulcanising tyres into an exact science. They not only advise motor traders and motorists with regard to the treatment of faulty tyres, but they have organised a technical branch for the instruction of repairers which may be dignified by the name of "Academy." There men are being equipped with the necessary knowledge to enable them to become experts in the use of the vulcaniser, and an acquisition to those firms able to claim their services. While thus developing that part of the tyre repair business which is concerned with trade on a large scale, the firm have also catered for the motorist possessing only one car or so. For him they have reduced their system to one of extreme simplicity, providing appliances of a handy and easily operated character. Their latest introduction is the H.F. "Baby" vulcaniser, shown in Fig. 1, ready for a tube repair. Compared with the first apparatus of this class put upon the market, this is indeed a lightweight machine.

Fig. 1.

The original apparatus weighed about 4 cwt.; this is only a few pounds in weight. It measures about 2½ in. by 4½ in., and is supplied with a series of interchangeable faces to fit any make of tyre moulds, being obtainable for any form. Thus any portion of the crown of the tyres or the sides right down to the bead can be easily and quickly repaired by means of the "Baby" vulcaniser. Its portability and efficiency should warrant it becoming regarded as an indispensable part of the car equipment, for it can be stowed away in the tool box or in any odd corner of the car. Should a cut or burst occur, it can be readily repaired, the steam being raised to the necessary temperature in a very few minutes by the use of a small quantity of methylated spirits. Thus the troubles associated with tyres can be permanently overcome when on tour, and the fact that the device is sold at a very reasonable rate is another factor that should lead to many inquiries being sent to Messrs. Harvey Frost and Co.'s headquarters, 39, Great Eastern Street, London, E.C. They have several demonstrating centres, where it can be seen in operation and maintaining the claims put forth on its behalf by the inventors.

Specialities for Motorists.

During recent years the motor department of the EAST LONDON RUBBER COMPANY has grown to good dimensions, the concern having striven to supply novelties of real value to motorists. For the present year they are recommending many standard goods, such as the Amac carburettor, for which they are the metropolitan selling agents. This is specially intended for use with motor-cycles and tri-cars. They have also the Kerry distributor, a feature in connection with which is that the low tension brushes can be taken out without interfering with the wires. The internal high and low tension contact bobbin can be easily withdrawn for cleaning purposes. The "Kerry" wind-

screen, Hay's electric vulcaniser, the Stewart speedometer, and other specialities are also stocked at their showroom in Great Eastern Street, London, E.C., where is a large assortment of Stepney wheels, Brampton, Coventry, and Renold chains, &c. The East London Rubber Company have also a repairing shop, in which they specialise on making replacements to pattern—a department in which they have attained considerable distinction.

The Gabriel Horn.

Messrs. BROWN BROS., LTD., of Great Eastern Street, London, E.C., inform us that the King is now using the Gabriel horn on two of his cars, and is also having another one fitted to a third motor-car. This Royal appreciation of a very resonant and musical motor-alarm will doubtless induce many motorists to consider the adoption of the device, which is illustrated in Fig. 2. The alarm is actuated by the exhaust, and the appliance consists of a single tube sub-divided into three chambers, from each of which a distinct tone is produced. The exhaust gases are received into an expansion reservoir which is in the horn itself, from which they are distributed evenly to the three compartments under a steady pressure, when a far-reaching alarm is produced. An important point is that the volume of sound is always under the easy control of the operator, so that he can give the comparatively unobtrusive alarm advisable in city traffic and a more far-reaching tone

Fig. 2.

necessary when in the country. The remarkable freedom from complicated parts and minor matters which would be likely to get out of order is an important merit, and the Gabriel horn can be attached to any make or size of car. It can be fixed in any desired position, and is manipulated by means of a pedal from the floor of the vehicle. By this means a wire cord is made to operate a valve which opens the pipe of the horn, closing the silencer exit simultaneously; thus the whole exhaust is directed through the horn. Just as in the Gabriel horn Messrs. Brown Bros., Ltd., have an accessory by which the motorist can have complete control and modulation of his alarm, so in their Autodipee lamp the firm have a light which can be equally well modified in town traffic. To this, however, we hope to make reference in an early issue.

A Novel Valve Grinder.

Several useful adjuncts to the equipment of the motorist have been introduced by Messrs. Markt and Co., who are well identified with the Jones Speedometer and other acknowledged standard fittings. An excellent appliance to obviate the loss of power, petrol and temper resulting from neglect of the valves of the engine is now being brought to the notice of motorists by Messrs. Markt and Co., whose London headquarters are at 6, City Road, E.C. This is the Brown Valve Grinding Set, illustrated in Fig. 3. The object of the device is to make easy the task of grinding in a valve, while the work can be done in about one-fourth of the time required by more usual methods. The outfit is simple. It consists of the grinder itself, the spring valve lifter, and a small box of compound furnished for use with the apparatus. This compound is a combination of lubricant with a high grade material to produce

Fig. 3.

friction, and provides an excellent abrading material. The Brown valve grinder is easily dismounted, and can be carried on the car without inconvenience. Little skill is required in the use of the tool, by which good work can be done in a minimum of time.

The Turco Electric Vulcaniser.

Introduced towards the close of last season, the Turco Electric Vulcaniser of the UNION RUBBER CHEMICAL CO., LTD., of Shaw Street, Ashton New Road, Manchester, has attracted considerable notice. The task of preparing the device for the vulcanising operation is simple, it being merely connected by means of a flexible cord to any 4-volt accumulator, care being taken that the latter is fully charged. As soon as the connection is made, the machine is ready for the repair, an operation which occupies twenty minutes, and requires no attention. In Fig. 4 the Turco Electric Vulcaniser is shown at work upon an outer cover. It is designed to deal with extensive repairs on both air tubes and outer covers, and is fitted with flat and concave vulcanising plates both $1\frac{1}{2}$ in. by $1\frac{1}{2}$ in., in the No. 1 4-volt. type. The inner tube repairs are performed on the flat plate, while, as can be seen from the sketch, outer cover repairs may be vulcanised without the removal of the tyre from the wheel. In the No. 2 8-volt type the amount of current absorbed is at the rate of 3 amperes per hour at 8 volts—a voltage readily obtained by coupling two 4-volt. accumulators in series. Although the ordinary ignition accumulator installed on the car is sufficient for the purpose, the Union Rubber and Chemical Co., Ltd., have brought out a new accumulator, which is specially constructed for rapid discharge—a fact which renders it particularly useful where a number of consecutive operations are required to be effected.

Fig. 4.

Tools and Similar Accessories.

The name of Messrs. BRANSOM, KENT AND CO., LTD., is well known to our readers, and they have several interesting accessories for the new season. Among these is the B.K. wipe contact-breaker for use in connection with trembler coils, a new feature being the use of a spring in place of the rollers used in some earlier types of contact-breakers. They have many types of exhaust-valve removers, a new one being the B.K. Simplex valve spring compressor. At their extensive show-rooms, 40, Great Eastern Street, London, E.C., we had the opportunity a few days ago of inspecting their complete range of horns of various types, including a new model of the "Universal" horn, which emits a loud tone not at all unmusical. It is of very elegant design, and is supplied nickel-plated or of polished brass, complete with 3ft. 3in. of flexible metal-braided tubing, together with a detachable cover to the mouth. This horn can be fixed either on the right or left of the car, and is likely to be much seen on the road during the coming season. Another extensive range of specialities for which this firm is responsible is in connection with jacks and other tools. The B.K. double extension light motor jack is being brought out for the convenience of those who have small cars and do not wish to add to their expenses to an inordinate degree. The B.K. jack is supplied at a reasonable price. When closed it is 8 $\frac{1}{2}$ in. in height, has an instantaneous lift of 11in., and a geared lift to 14in. At this season of the year mention may also be made of the back luggage carrier, made to fold conveniently at the rear of the car, and to let down when required for trunks, etc. This is made adaptable to all makes of bodies. Besides the usual sparking-plugs of well-known makes, Messrs. Bransom, Kent and Co. are placing upon the market the Bo-ko. The body of the plug is steel nickel-plated, and the solid nickel electrodes are so fitted that the sparking points cannot be deranged. Tool kits, and a score of other accessories indispensable to travelling motorists, are also to be seen at the firm's show-rooms, or provincial motorists will find them illustrated in the new catalogue issued during the present week.

Wind Screens.

Under the guidance of Mr. H. H. Dixon, manager of Messrs. LOWE, BEVAN AND CO., Birmingham, our Midland representative recently went through one of the largest and oldest coach-builders' ironmongers' factories in the country. The firm were one of the pioneers in

turning attention to the motor trade, and now their motor department is the most important side of the business. The journey from shop to shop was an education as to the detail and the infinite number of patterns necessary to carry on a large business of this description. As the firm have comparatively recently removed to Scotland Street, they took the opportunity of fitting up their works with the most modern labour-saving machinery and appliances. Owing to the nature of their business, their factory is really a series of small shops, and a number of electric motors of from 15 to 25 h.p. are distributed throughout the premises to drive the necessary machinery. There are something like twenty departments, such as polishing, close-plating, electro-plating, patterns, wind screen, woodwork, forging iron parts, enamelling, warehouses, smiths' shop, beading shop, show-rooms, etc., etc. In the latter we were shown a number of new designs and devices that are shortly to be placed on the market. One of their recent productions is the "Royal" patent wind screen, suitable for landaulette or limousine. The fittings are so constructed that the front folding glass can be set forward at any angle with a single movement, and by the same movement in the opposite direction the swinging glass can be stored away in the roof of the canopy. The company are having a large demand for their hoop-stick separators, which prevent the canvas from chafing when the hood is closed. Within the last few months the firm have taken in a wing adjoining, which they have fitted up as a machine and forging shop, and are now in a happy position, being able to manufacture on the premises everything they require from the raw material, thus saving a great amount of time. The firm have been working overtime all through the winter, and have not known for years what it is to be slack. Mr. Dixon informed us that during the last few months they have, amongst other things, turned out over 1,000 wind screens.

Trunks for the Holidays.

No holiday equipment for the car would be complete without attention to the requirements of the luggage carried by the motorist. Messrs. J. B. BROOKS AND CO., LTD., of Great Charles Street, Birmingham, are catering particularly in this direction, and have several excellent novelties in grid trunks, limousine roof and canopy trunks, and other specialities economising space and conducing to comfort and convenience on the car. In Fig. 5 we illustrate a pair of the firm's weather-proof grid trunks fitted to a 35-h.p. Daimler. These weather-proof trunks, shaped to the body of the car, and coloured to harmonise with the general decorative effect, are well known. In this the lower trunk has, in addition to the customary

Fig. 5.

lid, a folding front, which can be opened independently of the top lid; thus the contents are made available without disturbing the upper trunk in any way. In connection with this the firm have patent trunk-holders, which secure the trunk in a very neat way, securely holding it in position. They are easily unfastened, and should contribute to the comfort of the motorist on tour. Circular tyre boxes are another useful speciality, these being intended to economise space to the best advantage.

In addition to the novelties mentioned on the foregoing pages, others have been found in the showrooms of well-known firms, while several that were exhibited at the recently Cordingley Show deserve extended reference. Hence the following notes on specialities which have lately been the subject of considerable interest amongst practical motorists anxious that the various additions to their car equipment should be thoroughly up to date.

Headlights and Accessories.

Many interesting specialities were shown by the MOTOR ACCESSORIES COMPANY, including the "Fanphare" lamp, "Auto" lamps, the "Turn-

Fig. 6.—The "Fanphare" Lamp.

over" generator, new Ardee "Tell-tale" lamp, "New Era" fire-extinguisher, &c. The Ardee tail light indicator is an ingenious and reliable means of getting over the difficulty associated with the tendency of tail lights to go out and leave the motorist to pay the fine and costs. It can be fixed to existing lamps, and operates by expanding the air in a small chamber fixed over the flame in the tail lamp. The expanding air is carried to the front of the car by a small tube. There it lifts a shutter from over an aperture fixed in the lamp on the dashboard. When the tail light fails, the air quickly cools, causing the shutter to fall and obstruct the light of the bull's-eye, thus informing the driver of the risk he runs. For use in garages and motor-houses of large degree the "Waste Not" handcock of this company will be found useful. This tap fits on the hosepipe, and by holding the handle, a good supply of water can be directed on cars, &c.; when it is dropped from the hand the supply is automatically shut off, thus preventing waste. A leading novelty, however, was the "Fanphare" headlight, in which the rays of light are directed in a fanlike configuration, securing the light being transmitted laterally in a horizontal plane instead of being emitted upwards to affect the vision of pedestrians and others on the road. This desirable result is secured without obscuring the lens of the lamp, and all the rays of light are utilised. A lens of plano-convex cylindrical form, with an appropriate reflector, are used, and altogether the construction and design of this new headlight are equally commendable. Tail-lamps, magnetos, sparking-plugs, and a host of other accessories make up a representative display in their showrooms at 55, Great Marlborough-street, London, W.C.

Cape Hoods.

The BRIXTON CARRIAGE BUILDERS, of 56, Railton Road, Brixton, London, S.W., had an utilitarian display of their Cape cart hoods. This is a department in which they have specialised for some years until they have attained a high position in the trade. The special point of the hoods is that they are covered with a waterproof material of double thickness, rendered the more impervious to rain and wet by the rubber coating between. At the back of the curtain of the hood a large window is provided; brass or nickel beading is around the edges, and special neck joints are also provided. Of excellent material and design, the hoods of the Brixton Carriage Builders were notable in the section of the Show in which they were on view. The hoods are remarkably light, consistent with their durable qualities, and more than 2,000 were made last year—certain evidence of their good reception by motoring experts.

The "Boreas" Air Compressor.

Among the novelties in the Gallery was the "Boreas" motor-car air compressor introduced by Messrs. LACY-HULBERT AND CO., LTD.,

of 91, Victoria Street, S.W. This compressor has been specially designed for use on the car, where it can be readily driven from a shaft by means of belt, chain, or gearing, or by coupling direct. Its speed may be 500 to 1,000 r.p.m. It will not overheat, is silent in action, and will pump air up to 300 lbs. per square inch. The compressed air may be stored in a cylinder of suitable size, and is then available instantaneously at any time for inflating tyres, starting the engine, operating control apparatus, supplying pressure to fuel or lubricant, and a variety of other purposes. If it is not convenient to fit the compressor to the car it may be driven by a small electric motor from any electric light circuit or by any small shaft in a garage, workshop, or private house, and a store of compressed air may be carried on the car and replenished when required. Motorists will admit that it is very important that the pressure in the tyres should be maintained at a proper point, and this can be readily and easily effected in a few minutes by the use of the apparatus, which should attract some considerable notice.

Messrs. Lyell and Co.'s Novelties.

Several distinctive features of interest were to be found on the stand of Messrs. J. C. LYELL AND CO., LTD., 55, Victoria Street, Westminster, London, W.C. Among these was the "Clair" silencer, which, in addition to efficiently securing its object, does so with an absence of sooting and back pressure, that constitutes a decided advantage. Some idea of its arrangement will be gleaned from the accompanying illustration (Fig. 7). A series of metal cups fit one into the other, but do not bottom, so that there is a space left between each. Holes drilled in the base of each cup allow the gases to pass through from one cup to another in succession. The end cup is formed with a pipe outlet, through which the gases ultimately emerge. The cups are held in position by an outer flanged case, which is bolted to a cover, which also has a flange, and carries a union for connecting the silencer to the engine. The noise caused by the exhaust gases is completely suppressed, and the power of the engine is in no way reduced. The escape of the gas is made direct. The silencer achieved distinction in the trials organised by the Auto Club de France, and has maintained its reputation since in this country. Several models of the "Patrick" water circulating pumps were shown, and special mention may be made of the "Ursus" tyres and bands, which Messrs. J. C. Lyell and Co. have marketed with success. The distinctive feature of this non-skid consists in the use of steel bars in place of the familiar round stud. These bars are so securely affixed to the steel back plate that they cannot be pulled out, and it is claimed that this form of protection has greater durability

Fig. 7.—Section of the "Clair" Silencer.

than that which has become customary. Between the band and the cover a layer of asbestos cloth is placed, which will prevent the heat from reaching the rubber—a real point of excellence. In the electrical section of their display, the firm showed the "Zulu" change-over switch, which provides a complete interrupter for both circuits. This can be employed in conjunction with any magneto or coil, and can be adapted to any car. Among other accessories exhibited by Messrs. J. C. Lyell and Co., Ltd., were voltmeters, goggles, sparking plugs, metallic filament lamps, folding jacks, and, in fact, a very complete range of motor-car goods.

The Lubrimeter.

On the stand of Mr. J. E. GARRATT, 96, Southwark Street, London, S.E., was the Coventry Simplex motor to which we recently referred, and also the Lubrimeter, as illustrated in Fig. 8, in the form suitable for a double chamber engine. As its name indicates, this appliance is a device for showing the maximum and minimum levels of the oil in the crank chambers. This is done by means of a lamp fitted on the dashboard, and, as will be seen from the small inset drawing, showing a red or white light to demonstrate whether there is too little or too much oil respectively. In the illustration A B are two contact points through

Fig. 8.—The Lubrimeter as fitted to a double-chamber Engine.

which electrical connection is made to the red lamp, the lighting of the white one being secured by C D. E is the lead wire; F the spindle up and down which the float G slides; H and H' are pipes leading to the instrument from the crank chamber, the latter being adjustable to any angle; I is the insulated plate upon which the terminals N and N' and P are fixed; two halves of the crank chamber are shown in K K; L is an adjustable rod for adjusting the float to any desired oil level; S is the switch for distinguishing the level of the oil. When the button is pressed the white light glows if the oil is over-abundant; if there is too little oil the red lamp becomes lighted; should the level be right there is no glow at all. Sa is the switch for distinguishing the electrical circuit, and when this is pressed and both circuits are in order both lamps glow. The adoption of this appliance will prove a great convenience to the motorist, offering, as it does, a check on all systems of petrol engine lubrication. By means of the electric lamp indicator on the dashboard he can ascertain the exact quantity of oil existing in the crank chamber, and so obviate foul exhaust and similar objectionable features. The use of the Lubrimeter will also secure economy in the use of oil, while the fact that it can be fitted to any car gives it interest to every owner and driver.

"Pushon" Specialities.

Mr. H. J. HARDING, of 211, Northumberland Park, Tottenham, N., and also of Paris, has several useful novelties, characterised by good finish as well as design. His "Pushon" connection for motor-car and motor-cycle tyres is a notable feature of his collection. This connection, when simply pushed over the valve, instantly makes an air-tight joint. The compressed air from the pump holds an intumed rubber lip tightly on the valve, and the greater the pressure the greater the "hold." We noted that the rubber lips are interchangeable, and can be easily refitted when worn (only after some months, however) by gripping the valve thread. A new plug and tyre tester is also marketed, the latter having a large gauge registering correctly up to 160 lbs. per square inch. The connection is on the principle already described, and the gauge is of a reliable description. Mention may also be made of Mr. Harding's triple-band brake for motor-cycles. This is fitted concentrically to the spokes on either hub, a split ring being passed round inside the hub spokes, and the brake clamped together by ten screws. Vulcanising fluids and repair outfits are also included in Mr. Harding's stocks.

Pettett's Safety Filler.

PETTETT'S PATENT SAFETY FILLER COMPANY had a large exhibit of interesting appliances for motorists, the principal one being their patent safety motor filler, adaptable to all motor spirit-cans, to prevent the waste of motor spirit. At previous exhibitions we have fully described this appliance, by means of which filters are dispensed with, while the presence of a wire gauze prevents foreign matter getting

into the tank. It will empty and filter a two-gallon can of petrol in about 30 seconds. A car or container can be filled in the dark as easily as in the light, while the fact that it is impossible to overfill the tank lessens the danger of fire or explosion. At this stand the Kasmoid time-recording machine was on view, an excellent method of checking the time of employees which has been adopted in many motor works. Samples of the motor lubricants of the PURE OIL COMPANY, LTD., of Neasden, London, N.W., were also on view, as well as two excellent spanners—the "Gryp," a practical ratchet spanner which will successfully tackle the most awkwardly-placed nuts, and the "Newleva," for nuts in confined places, and which is able to turn those otherwise impossible to work except by hammer and chisel.

Bailey's Miloscope.

One of the novelties of merit is the miloscope, introduced by BAILEY'S MOTOR MILOSCOPE COMPANY, of 225, Oldfield Road, Salford, Manchester, and illustrated in Fig. 9. This is made under Fielding's patent, and shows the speed in miles per hour, as well as indicating the total mileage of the trip. It is remarkably clear from complicated mechanism, and has only one bearing and one moving part. The instrument depends on centrifugal force, as indicated if a vessel of liquid is rapidly rotated round its vertical axis. In such a case the liquid will fall in the centre and rise up the sides of the vessel, the surface assuming a concave form. The miloscope acts on this principle. It is a revolving vessel, consisting of two parts, an upper and a lower connected together by three tubes, one of which in the centre is of glass, the outer ones of brass. The lower chamber and the tubes are filled with liquid; on revolving the instrument round its vertical axis the liquid falls in the glass tube and rises through the brass tubes into the upper vessel, taking up a level varying according to the speed. A float in the centre tube acts as a pointer, and the speed can be read off a scale. The scale is longer than that on any circular dial indicator, and the divisions are practically equal in length. The instrument is hermetically sealed; the liquid cannot freeze or evaporate. The Miloscope runs on one ball bearing only. It is instantaneous in action and quite

Fig. 9.—Bailey's Milometer.

dead-beat, giving good open indications from zero to fifty miles on a length of scale $4\frac{1}{2}$ in. The instrument is driven by friction from the front wheel of the car through a flexible shaft. It is easily fitted, and various forms of attachment are supplied by the makers to fit any make of car. Other specialities of this firm include Bailey's "open-door" tyre carrier—an effective device for carrying Stepney wheels, Cave's detachable rim, or the Rudge Whitworth spare wheel. Motor watches, tyre testers, and lubricators have also received the attention of this concern.

The Ara Vulcanising System.

Demonstrations of the Ara system of vulcanising tyres without heat have recently attracted considerable attention to the ARA MATERIAL PATENTS AND MANUFACTURING CORPORATION, whose headquarters are at 33, Chancery Lane, London, E.C. Fig. 10 illustrates the whole mechanism involved, from which it will be seen that it is "simplicity itself." By its means repairs can be effectually made to slits in inner tubes, punctures, bursts, cuts in covers at a trifling cost, and in the minimum time. The principle involved is that of the collection of small pieces of raw rubber in a container, vulcanising them by immersion, and welding them together so as to produce a homogeneous material of high-tensile strength. This is applied by pressure to the tyre

Fig. 10.—The Ara Vulcanising Outfit.

to be repaired by means of the thumbscrew shown in the illustration, and the work is done in the short space of about five minutes. A new exhibit in the Ara display was a patent motor vulcanising stand for use in garages, workshops, &c. This is to enable the operator to readily deal with the heavier class of vulcanising work on covers and tubes. It is provided with three presses, enabling three different repairs to be accomplished at one time, thus considerably facilitating the work of repairers.

Petrol.

At their stand in the Show, Messrs. CARLESS, CAPEL AND LEONARD had samples of their standard petrol for this country, as well as of petrol suited for use in tropical climates. Fuel oil for metallurgical purposes, the "Carline" lubricating oils for the bearings and cylinders of motors, the "S." lubricating oil for air or water cooled motors, and refined French colza for carriage lamps, etc., were also shown. The firm had also a large selection of their petrol storage tanks, which are well known to the trade and the motoring public. They also showed their patent benzine safety lamp. The latter has been especially designed for lighting buildings where motor cars are kept, and can be readily lighted without being opened, and locked so that only a powerful magnet can open it.

The Morris Non-skid.

The MORRIS PATENT NON-SKID TYRE SYNDICATE, of 65, London Wall, London, E.C., take advantage of the occasion to make known the special points of the Morris non-skid tyres, as well as of an improved form of electric lamp for motor-cars. The latter has a new form of lens made of Bohemian glass, into which a 6-c.p. lamp is inserted. The effect is to give a light of exceptional penetrating power at a reasonable price. The Morris non-skid possesses some points of special interest in view of the agitation now going on with regard to studded tyres. In this new type the central part of the tread is grooved, and a chain inserted, the effect of which is to give immunity from slipping. Another form consists in the insertion of small metal troughs about two inches long by an inch wide and three-eighths of an inch deep. These can be of aluminium or heavier metal as desired, and are filled with solid material. The troughs are fixed on the same principle as the familiar metal studs, and each is attached to the other by a bolt, the whole device constituting, it is claimed, an efficient preventative of skidding.

Russian Petrol.

In the Gallery, rows of unfamiliar yellow tins made known to motorists the presence of the PETROLES DE GROSNIY (RUSSIE) SOCIETE ANONYME, of 101, Leadenhall Street, London, E.C., who are placing on the British market the P.G.R. motor spirit in two-gallon tins. It is claimed that this is a source of power for internal-combustion engines that will not soot and that will prove satisfactory as regards speed, power, cleanliness, and economy. The company intend to popularise this Russian product among British motorists during the coming season,

and their representation at the Exhibition should go far in that direction. The annual production of the company is approximately nine million gallons, and three grades of spirit are to be offered, viz., .705-.710, .725, and .750-.760. The first will be of a low density, and will generally be of the .705 degree, the second grade will be uniformly .725, whilst that in the third category will be specially suited for commercial vehicles. Tests and experiments on the Continent have given the new supplies a favourable introduction, and its advent to this market is a matter of universal interest and importance.

The Collex Wheel.

Fitted to a car which was available for daily trial trips, the Collex wheel suggests further developments towards finality in motor-car construction. The rim is collapsible, and enables the cover to be taken off and a new one put on again in a few seconds without any stretching of the beaded tyre or nipping of the inner tube, thus obviating risk of damage. When the tube has been placed in the cover the collapsible rim is placed inside. The security bolts are then put in, and by means of a lever the rim is made up complete. Altogether the device is both simple and effectual. We have seen a car fitted with four of these wheels, which has already run 500 miles with success. With the Collex wheel it is really not necessary to carry a spare wheel, as the tyre can so easily be taken off the collapsible rim and another put on without difficulty. The PATERSON MOTOR WORKS, 40, High Row, Darlington, are the agents for the device.

Speed Indicators.

In connection with instruments for the accurate and reliable registration of the speed of motor-cars, the name of Messrs. S. SMITH AND SON, LTD., of 9, Strand, London, W.C., naturally occurs to the ardent motorist. Their stand at the Show was as complete as ever, and gave a full representation of the numerous specialities offered by the firm. Visitors to the Exhibition were informed of some reductions in prices about to be established, which should have the effect of increasing the hold which their speed indicators and other instruments of precision have upon those who indulge in the joys of speed. These lessened prices have been made possible owing to the gradually increasing output, and the system of standardisation which has been closely followed at the works until economy in production has been brought down to the minimum. It is now possible for the much-quoted "man of moderate means" to obtain an indicator registering up to 40 m.p.h. complete with mileage recorder and clock, as shown in Fig. 11, for a really low price. The acceptance of such indicators to controvert police evidence is now almost a rule in some courts, and, in any case, the indicator is a useful piece of evidence where constables are prone to economise in the use of truth.

Fig. 11.—Smith's Combined Speed Indicator and Watch.

Reference may be made to some of the specialities of Messrs. S. Smith and Son. Their "Runabout" indicator records speed accurately up to 40 m.p.h., and a total mileage up to 10,000. The same mechanism is employed as is used in the firm's "Perfect" indicators, which have been supplied to many Royal motorists. This cheaper form is recommended as especially serviceable for small cars. In addition to speed indicators, the exhibit included the "Perfect" communicator for giving directions to the chauffeur by merely pressing the button in the interior of an enclosed car. Thereupon a bell rings and a light appears on the dial opposite the driver. A combined electric and bulb horn and a new milometer are other new specialities for 1908.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

DETACHABLE RIMS v. DETACHABLE WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Old Motorist,” in your issue of the 11th inst., complains that the detachable wheels do no more than transfer the changing of the tyre from the palpitated flurry of the road to the spacious leisure of the garage; but surely even this is no small thing. There are many things that if done slowly are by no means irksome, while if done in a violent hurry they are extremely distasteful and even dangerous to health. For example, most of us devote from two to three hours a day to eating, and most of us enjoy it, but if this same amount of eating had to be done in a quarter of an hour we doubt very much if this necessary occupation would be so popular as it is now.

Of course everybody admits that if tyres never wore out, or if they could be changed and inflated more easily than is now the case, it would be a great improvement, if at the same time the facilities were not accompanied by other serious disadvantages. But in the present state of the art of tyre making it is surely desirable to enable the motorist to eliminate the delays on the road due to tyre trouble and to ensure that the tyre shall be changed under garage conditions giving ample time and proper facilities for the work, thus avoiding damage to the tyre and unnecessary strain to the operator. —Yours truly,

JOHN V. PUGH.

THE EXPIRY OF LICENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just had a summons from the police for driving a motor-car after the term of my licence had expired. It was taken out just over thirteen months ago with the London County Council and had run out without any notification being sent to me of the fact. To make matters worse my employer has also been served with a summons for employing an unlicensed driver. I should be glad if you would inform me as to the maximum penalty to which each of us is liable, and whether it is in order for the police to summon the employer for something which is not his fault but entirely the act of the forgetfulness of another person. —Yours truly,

CHAUFFEUR.

[As we pointed out in our issue of the 21st ult. the London County Council is one of those authorities which do not trouble to inform the holders of motor-car licences as to the expiration of the terms for which they are granted. In Section III., Sub-section I., it is a contravention of the Act to either drive without a licence or employ a person whose licence has expired, and the police are acting quite within their powers in this matter. The maximum fine allowed by the Act in each case is £20, but this has not, to our knowledge, yet been inflicted, considerably smaller sums being the rule.]

REMOVING SCALE FROM RADIATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that you recommend the use of hydrochloric acid for cleaning out clogged water jackets and radiators, but I would like to draw your attention to a danger which is very serious, if an excess of acid be used: If a weak solution of acid be used, there is no doubt that in the first place it will attack the deposit from the water, but if there be an excess of acid, the metal of the radiator will be dissolved rapidly, and I would therefore advise that a very weak acid solution be used, say about 0.1 per cent., and that the dose be repeated until there are signs that the deposit has considerably diminished. I certainly would stop the treatment whilst there is still a little of the deposit left. —Yours truly,

A. DUCKHAM.

LIGHTS IN MOTOR-CABS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to suggest to the various motor-cab companies the advisability of providing some means of lighting up the interior of their vehicles at night time. In a motor-bus it is possible to read one's evening paper comfortably, but in a motor-cab this is, at present, not possible. The convenience is one which would be, I am sure, much appreciated by many more than—Yours truly,

F. ROBERTSON.

TESTING CARS AND THE EMISSION OF SMOKE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am extremely pleased to see that the Chief Constable of Coventry has issued a circular to the local motor-car manufacturers asking them to endeavour to abate the nuisance caused by the emission of smoke from cars out on test. During the past year or so this trouble has grown to a very serious one, and I sincerely trust that makers concerned will show their appreciation of the manner in which the police authorities have approached the subject by giving strict instructions to their drivers not to over-lubricate their engines when testing cars on the road. I quite appreciate the fact that cars must be tested, but there is

no reason why greater care should not be taken in preventing them from being a serious annoyance to the general public. —Yours truly,

A WARWICKSHIRE MOTORIST.

IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you, or any readers of the *M.C.J.*, could give me any help in connection with the trouble I am experiencing with the engine of my single-cylinder car. I find that sometimes the first spark from the plug is a very good one, but that the succeeding ones gradually get weaker. Is this the fault of the accumulator, coil, or the sparking plug? —Yours truly,

W. STEPHENSON.

[The most probable cause of our correspondent's trouble lies in the accumulator, as the spark being good at first and gradually getting weaker points to the battery being exhausted, though it has enough pressure to start. The result should be the same with both the new and the old plug; but, as our correspondent found the engine would start with his old plug and not with a new one, this result is most likely due to the fact that the points of the old plug were in better adjustment to suit the power available, which would be weak. The voltage of the accumulator should be tested with a voltmeter or four-volt lamp. If the lamp glows brightly for a few moments and then gradually dies away to a dull red, the accumulator requires charging.]

The Star Delivery Van recently supplied by the Star Engineering Company to Messrs. Lever Brothers, Port Sunlight.

The vehicle is provided with a 9-h.p. two-cylinder engine, and has three speeds forward and a reverse. Solid tyres 3½ in. diameter are fitted, and the van is built to carry 12 to 15 cwt. The machine has proved so suitable for the work it is intended for that the Star Company have received an order for a large number of the same.

THE SUNDAY SALE OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad to see that a clause has been added to Lord Avebury's Sunday Closing (Shops) Bill, protecting the sellers of petrol from the penalties which would otherwise have been enforced on them. While there are, of course, many motorists whose cars are in daily use, there are thousands of others whose opportunities for motoring are confined to the week-end, to whom the difficulty of obtaining supplies of spirit on Sunday would prove a real hardship. Even now, without any restriction on the sale of petrol, it is not an easy matter to procure supplies on Sunday, as I found out a year or so ago when returning home from a vacation in the North. We had got as far as High Wycombe, on the Oxford-London road, and, although I still had a quantity of spirit in the tank, I thought it wise to lay in a reserve so as not to be hung up on the road. This was easier said than done, however, as it was only after much delay that I found a place where petrol could be secured. —Yours truly,

W. T. RAWLINSON.

A LAD picked up the front lens of an acetylene car headlight on Sunday afternoon on the Hogsback. The owner can have the same on sending particulars to Mr. H. F. Knight, of Barfield, Farnham, who will transfer any reward to the lad who found it.

REPLYING to “Clifton,” who asks as to the prospects for a motor engineer going from this country to New Zealand, we learn from the Agent General for the Colony in London that he “is not advised that the demand for motor engineers is at all in excess of the supply.”

ROYAL.

THE Marquis of Salisbury, Sir W. H. Manning, the Acting Governor of the Nyasaland Protectorate, the Rev. Bruce Cornford, M.A., and the Rev. R. J. Campbell, M.A., have been elected as individual associates of the R.A.C.

New members of the Royal A.C. include His Highness the Maharaj Rana of Dholpur, the Earl of Malmesbury, Col. the Hon. E. Stuart-Wortley, C.B., Sir C. T. Metcalfe, Bart., and Capt. Sir C. J. Graves-Sawle.

A small sub-committee of the R.A.C. has been appointed to oppose the clauses of the Licensing Bill, so far as they deal with clubs.

The following gentlemen have been elected as stewards of the R.A.C. subject to their willingness to serve:—The Duke of Sutherland, K.G., Lord Stanley, C.B., Sir David L. Salomons, Bart., Sir J. H. A. Macdonald, K.C.B., Sir W. G. D. Goff, Bart., the Hon. Arthur Stanley, M.V.O., M.P., Col. H. C. L. Holden, R.A., F.R.S., Messrs. C. D. Rose, M.P., E. H. Cozens-Hardy, Charles Hardy, P. S. Foster, and F. P. Armstrong.

The R.A.C. Year Book Committee is now composed of Messrs. F. P. Armstrong, C. W. S. Crawley and the editor of the club journal.

At least two members of the R.A.C. are concerned in the recent Ministerial changes. The Earl of Crewe, who now becomes Secretary of State for the Colonies and leader in the House of Lords, joined the club last year. Lord Lucas, the new Parliamentary Under-Secretary for War, has been a member since 1905.

The regulations and entry forms for the speed race to be held in the Isle of Man in the early part of October have now been finally approved. The race is essentially a chassis race, and has been instituted as a sport.

MIDLAND.

HEREFORD has been decided upon by the Midland A.C. as the headquarters of the reliability trials at Easter. On Good Friday there is to be a run from Hereford to Symond's Yat, on the 18th inst. from Hereford to Tewkesbury, and on Easter Sunday from Hereford to the Speech House in the Forest of Dean. The reliability trial will take place on Easter Monday, the route being from Hereford to Ledbury, Gloucester, Newnham, Chepstow, and Monmouth, back to Hereford.

BRISTOL AND GLOUCESTERSHIRE.

THE annual report of the Bristol and Gloucestershire A.C. shows a satisfactory financial position and an increase of nearly forty members during the year, making a total of 142 at the end of the annual financial period. Reference is made to the fact that during the year the Cheltenham Town Council intended to apply for a speed limit order for the town, but upon conference with the club officials it was agreed that the latter should place warning signs at the main road entrances, whereupon the local authorities promised to withdraw their application to the L.G.B.

SOUTHERN.

A SUCCESSFUL house dinner was held on Thursday of last week, followed by a general meeting, in which the runs and competitions for this season were discussed. A large number of members, wishing to show their appreciation of Mr. W. Lorkin, the general secretary, made this the occasion to present him with a silver cigarette box and cigar case.

April 25th is the date of the opening run to the Glen Arms, Ewell.

Messrs. Oscar Cupper and Warwick Wright on their Metallurgique Cars.

The Porthos Cars.

THE CRYSTAL PALACE AUTOMOBILE CLUB'S FLEXIBILITY TRIAL.

Photos by

ing contest only. The two most important regulations are the following:—

"The race is for cars the D²a (diameter of the cylinders in inches squared and multiplied by the number of cylinders) of whose cylinders shall not exceed 64, i.e., whose R.A.C. rating is not greater than 25.6 h.p. Cars fitted with internal combustion engines shall not have less than four working cylinders."

"The minimum weight shall be 1,600 lbs., which shall exclude the driver, mechanic, petrol, oil and water, spare parts, spare tyres, and tools."

In connection with the Nottingham meeting of the Royal A.C. on the 9th prox. the following Nottingham firms have agreed to provide motor accommodation at a uniform rate (viz., to stand cars in garage, 1s. per night, washing 2s. 6d. each):—A. R. Atkey and Co., Ltd., Trent Street; H. Belcher, Parliament Street; Bennett and Co., 2, Talbot Street; R. Cripps and Co., Ltd., Arkwright Street; and the Welbeck Hotel, Milton Street.

MOTOR UNION.

A NUMBER of members have recently communicated with the Union on the subject of the claims which have been made upon them in connection with the use of cars which do not bear a licence plate in respect of certain patents of which Messrs. De Dion Bouton (1907), Limited, claim to be the owners in this country. The matter has been before the Legal Cases and Legal Reports Committee of the Union for some time past, and in view of the large number of members who appear to be involved it is receiving very close investigation. All automobilists upon whom claims have been made of the nature above indicated who are owners of unlicensed engines of this make are requested to communicate with the Secretary to the Motor Union, 1, Albemarle Street, Piccadilly, London, W.

[Campbell-Gray.]

Two attendance prizes, kindly given by Mr. Grottick, are to be competed for this season, for the greatest number of official runs put in by members, ladies and gentlemen respectively. A members' speed-judging competition will be held at an early date, open to all types. An innovation in the club runs will be Thursday evening runs during the summer months.

The following have accepted office for the current year:—President, G. Howlett; vice-presidents, Messrs. W. Howlett, Col. Mark Mayhew, I. H. Mitchell, Staplee Firth, H. L. Doulton, F. C. Patterson; chairman, A. Vicars; vice-chairman, B. Grottick; committee, Messrs. Pugh, Brodie, Patterson, Connor, Worger; sports secretary, A. W. Holt; social secretary, A. C. Belcher; reporting secretary, K. Davies; general secretary, W. L. Lorkin; auditors, J. W. Cufley, G. Fisher; riding officer, F. S. Fitch; Motor Union representatives, Messrs. Vicars, Lloyd, and Lorkin.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

A MEETING of the council of the institution was held at the Institution of Mechanical Engineers, S.W., on Wednesday of last week, when the following were elected members of the institution:—Messrs. R. J. Sully (Cardiff), E. C. Baxter (Assam), A. M. Thomson (London), J. I. Emery (Crowborough), P. A. Sharman (Hitchin).

The following committees were appointed:—

FINANCE.—Messrs. Dugald Clerk, Col. R. E. Crompton, Dr. H. S. Hele-Shaw, T. B. Browne, F. C. A. Coventry, T. C. Pullinger, Henry Lea.
GRADUATES' SECTION.—Messrs. Dugald Clerk, Dr. H. S. Hele-Shaw, A. Craig, L. H. Hounsfield, T. C. Pullinger, A. Sharp, Douglas Mackenzie, D. J. Smith, Chas. Wheeler, F. R. Simms.

PUBLICATIONS AND EDITING.—Messrs. Dugald Clerk, Col. R. E. Crompton, Dr. H. S. Hele-Shaw, L. A. Legros, Douglas Leechman, R. K. Morcom, J. Lyons Sampson, and A. Sharp.

STANDARDISATION.—Messrs. Dugald Clerk, H. Austin, A. Sharp,

C. R. Garrard, Henry Lea, F. L. Martineau, T. C. Pallinger, J. S. Critchley, and Chas. Wheeler.

THE SCOTTISH TRIAL.

IN accordance with Rule No. 7 the Committee of the Scottish A.C. have resolved to accept in any one class only one car of any specific make, type, and horse power. This course has been adopted in all former Scottish Trials and is, in the view of the committee, the most equitable and just to all competitors. In consequence there will be a slight reduction in the number of vehicles competing in the Scottish trial, although it will not affect the aggregate number which will be going over the course.

SCOTTISH MOTOR TRADE ASSOCIATION, LTD.

AN extraordinary general meeting of the members of the Scottish Motor Trade Association, Ltd., was held in the Carlton Hotel, Edinburgh, on Friday of last week. Mr. Thomas Shaw (Messrs. Thomas Shaw, Ltd., Dundee), president, presided. A meeting of the council was also held on the same day. Mr. Thomas Shaw presided. There were also present, Messrs. W. L. Sleigh, J. H. Paterson, James Gibbon, and A. G. Rennie.

The following new members were admitted:—The Maudslay Motor Company (1907), Ltd., 60, Piccadilly, London, represented by Cyril C. Maudslay; Mr. Alexander Paterson, City Motor Works, Elgin; Messrs. J. Cairn and Co., 24, Annandale Street, Edinburgh; John Graham, 362B, Leith Walk, Leith; and W. Blues, The Garage, Pitlochry.

Scottish Motor Trade Association Hill-climbing Competition.—In consequence of the majority of the members favouring a hill-climbing competition confined to its members, the following gentlemen were appointed as a committee to make arrangements for this event, which will probably take place in the autumn. Messrs. J. H. Paterson (convener), Thomas Shaw, W. L. Sleigh, A. G. Rennie, and R. R. Smith. This competition will be of a purely sporting nature, and advertising the results will be prohibited.

Owing to the inroads which have been made into the interests of legitimate motor manufacturers and traders businesses through price cutting and other practices the Scottish Motor Trade Association find that they could not adopt any practical remedy consistent with their memorandum of association, as such questions were out with the objects therein set forth. Accordingly at a recent meeting of the leading Scottish motor traders, called by the council of the Scottish Motor Trade Association, Ltd., it was unanimously decided to form the Scottish Motor Trade Alliance, the primary objects of which are to maintain prices, prevent price cutting and other objectionable practices, and to take every possible means to protect the interests of those engaged in the motor industry. This alliance will be in constant communication with the motor trade societies. In order to be thoroughly effective, the whole trade should combine and work in union, and with this in view the council of the alliance have fixed the annual subscription at a nominal sum of 5s. The council has further authorised the immediate formation of local centres, which will not only increase the sphere of influence of the alliance but will give every trader throughout the country an opportunity of taking an active interest in the protection of his own business without inconvenience and expense. Local centres have already been formed in Edinburgh, Glasgow, Dumfries, Fife, Dundee, Aberdeen, and others will be formed on the application of five members in the district for which the centre is desired. Rules have been framed and are now being issued to the whole motor trade in Scotland. Members desiring to join may obtain full information from the general secretary, Mr. David A. Fairley, G.A., 13, York Place, Edinburgh, or from the undermentioned gentlemen, who are conveners of the local centres already formed. Messrs. Thomas Shaw, 32, Reform Street, Dundee; J. H. Paterson, 10, Bonaccord Street, Aberdeen; A. G. Bennie, 60, North Wallace Street, Glasgow; John Love, Carlyle Road, Kirkcaldy; W. E. Townsend, 56, Belford Road, Edinburgh; and A. G. Penman, Queensberry Motor Works, Dumfries.

CRYSTAL PALACE.

ON Saturday the Crystal Palace A.C. were to have held their open flexibility contest in accordance with the R.A.C. and S.M.M. and T. standards for touring cars. Considerable time was occupied in measuring and weighing the nineteen vehicles in the trials, and when the cars arrived at Bexhill none were allowed on the track, workmen preventing access by laying piping across the road. Thus the officials were frustrated, owing, it was rumoured, to some legal proceedings in progress.

THE Duke of Argyll has consented to become hon. president of the Aero Club of the United Kingdom.

MESSRS. MARTIN, of Magnet Wharf, Bow Bridge, London, E., are making a speciality of dealing in shop-soiled and second-hand commercial motor vehicles, and have in stock a number of well-known types of chassis suitable for cars, motor-buses, or lorries.

REVERTING to the article in last week's issue with reference to the visit of Mr. C. Jarrott to the Continent on his 40-h.p. Crossley car, fitted with Continental tyres, we learn that the latter behaved splendidly and that they were in perfect condition on reaching Monte Carlo.

THE IRISH RELIABILITY TRIAL.

THE following entries have been received:—

SECTION I.—OPEN.

Class A (Chassis price, under £150): E. Lisle, jun., 10-h.p. Royal Starling and 8-h.p. Imperial Starling; H. S. Huet, 10-h.p. Royal Starling; P. L. D. Perry, 15-18-h.p. Ford (two cars); Rover Company, Ltd., 6-h.p. Rover; Phoenix Motors, Ltd., 8-h.p. Phoenix.

Class B (Chassis price, £150 to £200): H. E. Edwards, 9-h.p. Adler; Robert Burns, 10-12-h.p. Swift; Smeddle Kennedy Motors, 8-10-h.p. S.K. Simplex; Chambers Motors, Ltd., 10-12-h.p. Chambers; P. L. D. Perry, 15-18-h.p. Ford (two cars); F. E. Carter, 10-12-h.p. Swift; T. W. Murphy, 8-10-h.p. Rover; Rover Company, Ltd., 8-10-h.p. Rover; Anglo-American Motor Car Company, 9-h.p. Cadillac (two cars).

Class C (Chassis price, £150 to £250): W. Phillips, 10-12-h.p. Humber; Chambers Motors, Ltd., 10-12-h.p. Chambers (two cars); Riley Cycle Company, Ltd., 12-h.p. Riley; J. W. Buchanan, 10-12-h.p. Humber.

Class D (Chassis price, £250 to £350): G. W. Hands, 16-20-h.p., Calthorpe; Russell Fletcher, 16-20-h.p. Calthorpe; Leslie Port-r, 16-20-h.p. Calthorpe; Robert Burns, 18-24-h.p. Swift; J. B. Ferguson, Ltd., 14-16-h.p. Argyll; W. Phillips, 15-h.p. Humber; British Motor Loc Syndicate, Ltd., 18-h.p. Motobloc; P. A. G. Bell, 16-h.p. Bell; A. Rawlinson, 14-16-h.p. Darracq; W. F. Pearce, 12-14-h.p. Gladiator.

Class E (Chassis price, £350 to £450): A. Armitage, 18-22-h.p. C.C.C.; J. Percy Dean, 20-h.p. Scout; D. H. McDowell, 20-h.p. Beeston Humber; H. P. McConnell, 16-20-h.p. Stella; W. G. Wilkinson, 20-h.p. Rover; Anglo-American Motor Car Company, — h.p. Cadillac; S. T. Robinson, 15-h.p. Talbot; A. G. Power, 14-16-h.p. Berliet.

Class F (Chassis price, £450 to £550): F. Eastmead, 20-h.p. Sunbeam; Clement-Talbot, Ltd., 15-h.p. Clement-Talbot (two cars); A. Rawlinson, 25-35-h.p. Darracq; S. T. Robinson, 25-h.p. Weigel; S. T. Robinson, 28-h.p. Minerva; Knox Browne, 22-h.p. Berliet; A. G. Power, 40-h.p. Berliet.

Class G (Chassis price, £550 to £700): Thomas Henshaw, 35-h.p. Daimler; W. F. Pearce, 35-45-h.p. Gladiator.

Class H (Chassis price, exceeding £700): S. F. Edge, 60-h.p. Napier.

SECTION II.—LIMITED.

Class B (Chassis price, £150 to £200): Captain Hamilton, County Donegal, 8-10-h.p. Darracq; J. G. Drury, Dublin, 8-10-h.p. Rover; F. E. Carter, Sunderland, 10-12-h.p. Swift; T. W. Murphy, Dublin, 8-10-h.p. Rover.

Class C (Chassis Price £150 to £250): T. MacGregor Greer, County Tyrone, 12-14-h.p. Shamrock; P. Hallinan, Middleton, 12-18-h.p. Riley.

Class D (Chassis price, £250 to £350): John Browne, Santry, County Dublin, 15-h.p. Coventry Humber; J. H. Kenny, Dublin, 14-16-h.p. Argyll.

Class E (Chassis price, £350 to £450): Colonel Kingscote, County Limerick, 14-22-h.p. Germain; H. B. Browning, London, 20-h.p. Rover.

Class F (Chassis price, £450 to £550): T. MacGregor Greer, County Tyrone, 24-h.p. Minerva; R. W. Morris, Waterford, 18-24-h.p. Gladiator.

Class G (Chassis price, £550 to £700): Thomas Henshaw, Dublin, 35-h.p. Daimler; T. L. Plunkett, Portmarnock, 48-h.p. Daimler; A. N. Johnstone, London, 24-30-h.p. De Dietrich.

CASES UNDER THE MOTOR CAR ACT.

THE CAR AS OBSTRUCTION.

At Bow Street (London), Police Court, J. B. Taneborne, c'auiteur to Col. Sutherland, was summoned by the police for causing an unnecessary obstruction in Exeter Street. The police-constable declared that a motor-car was left outside the Criterion Restaurant for forty minutes, and that he caused an obstruction. On cross-examination by Mr. Staplee Firth he admitted that he did not see the motor-car arrive, and it was shown in evidence that it had not been there more than twenty minutes, and Mr. Marsham dismissed the case.

REAR LIGHTS.

At the Liverpool Police Court a motor-car driver was summoned for not having a light on his car so as to illuminate the identification mark. From his evidence it transpired that he was in charge of a new motor vehicle which he was trying before handing over to the purchaser. A breakdown had occurred on the road which had delayed his getting back before sunset. Despite this explanation a fine of 10s. and costs was imposed.

EXCEEDING THE LEGAL LIMIT.

Half a dozen motorists have been fined sums of £5 and £6 with costs at Kingston for exceeding the ten mile speed limit in Richmond Park.

At the Brentford Petty Sessions several motorists have just been fined for exceeding the legal limit on the Bath road at Hounslow. In one case the defendant objected that that particular thoroughfare was wide and there was no traffic about at the time he was stopped. The chairman of the bench replied that it was only through the action of the magistrates that the inhabitants of that district were prevented from attacking motorists with bottles and stones owing to the excessive speed of many of their cars. Allowing two seconds extra on the time alleged by the police the bench then imposed a fine of £1 per mile for every mile in excess of the legal limit.

THE LORRAINE DIETRICH WORKS AT BIRMINGHAM.

ABOUT the middle of last year, realising the importance of the English market, the Société Lorraine de Dietrich and Co., de Luneville, France, arranged with a few friends in England to form a company for the purpose of purchasing a factory and manufacturing the well-known De Dietrich cars in this country. Immediately £100,000 was privately subscribed, partly by the French company and partly on this side, the Board of the new company being composed of the following:—Lord Ribblesdale, chairman, Sir West Ridgeway, Prince d'Arenberg, Baron A. de Turckheim, M. Henri Estier, M. de Neuville, M. Carnot, M. Leon Turcat, and Mr. W. M. Letts. They then proceeded to look out for a factory, and, realising the importance of Birmingham as a manufacturing centre, bought the Ariel Works, at Selly Oak, with its machinery and freehold land, and at once started to erect more shops. Although the designs were not passed until late in the year the first car was tested and put on the road for the Olympia Exhibition, while, to show that no time has been lost, it may be mentioned the output is now three cars per week, and it is hoped in the very near future to increase this to six.

On Wednesday, last week, at the invitation of the Lorraine Dietrich Company, we, in company with a number of other motorists, paid a visit of inspection to the works and found them well adapted for the purpose, being conveniently arranged and equipped with machine tools of the latest type. The ground floor covers 6,697 sq. yards; the total area of the old building consisted of 25,077 sq. ft., while the new premises represent an addition of 25,439 sq. ft. The number of men employed at the present time is between three and four hundred. The works are under the management of Mr. C. Sangster and Mr. Drummond. The

A Part of the Machine Shop.

THE BROOKLANDS TRACK.

THE following are the entries for races to be run on Saturday, the 18th:—

Third 26-h.p. Standard Class Race: Theo. Masui, 25·6-h.p. Germain; S. F. Edge, 25·6-h.p. Napier; Walter Phillips, 25·6-h.p. Humber; Miss D. Levitt, 25·6-h.p. Napier; J. W. Stocks, 25·6-h.p. De Dion.

Third 40-h.p. Standard Class Race: S. F. Edge, 38·4-h.p. Napier; Walter Phillips, 38·4-h.p. Humber; Marquis de Mouzilly St. Mars, 39·6-h.p. Napier; J. A. Holder, 38·1-h.p. Daimler; Capt. G. Ll. Hinds-Howell, 40-h.p. Iris.

Second Surrey Stakes: S. F. Edge, 38·4-h.p. Napier; Marquis de Mouzilly St. Mars, 39·6-h.p. Napier; Capt. G. Ll. Hinds-Howell, 40-h.p. Iris; G. F. Heath, 41·9-h.p. Darracq.

Brooklands Cup (handicap for private competitors): O. L. Bickford, 22·4-h.p. Ford; G. C. G. Moss, 27·2-h.p. Arrol-Johnston; Howard G. Nalder, 35·7-h.p. Berliet; Anthony van Hoboken, 35·7-h.p. Mercedes; C. A. Bird, 34·5-h.p. Mercedes; J. L. Farmilos, 24·8-h.p. Mercedes; C. L. Woodward, 24·8-h.p. Renault; G. Russell-Miller, 22·4-h.p. de la Buire; O. S. Thompson, 36·1-h.p. Austin; T. Faulker, 24·8-h.p. Mercedes.

Sizaire et Naudin Cup: Baldwin S. Millard, Basil Gill, G. F. Scantlebury, G. A. Schofield, F. G. Linscott, Colonel T. Cowper-Essex, Captain A. Horne, G. Bayard Hynes, Capt. T. C. J. James-Trevor, and R. C. Empson. All these will race on 8·9-h.p. cars.

Spring Stakes: P. D. Stirling, 35·7-h.p. Berliet; Douglas Pigot, 35·7-h.p. Berliet; H. F. W. Farquharson, 35·7-h.p. Berliet.

On Easter Monday the programme will be as follows:

Third 90-h.p. Standard Class Race: S. F. Edge, 90-h.p. Napier;

The Chassis Erecting Department.

THE LORRAINE-DIETRICH COMPANY'S WORKS AT SELLY OAK, BIRMINGHAM.

cars are, however, still being designed by Messrs. Turcat and Mery, and follow the De Dietrich practice.

Lord Ribblesdale presided at the luncheon which followed the inspection of the works, and in his speech welcoming the visitors stated that in 1884 the De Dietrich Company were in existence as engineers in Alsace, afterwards moving to Luneville in 1870, where railway stock, from trucks to magnificent saloons, were at present being made. Ten years ago they started building motor-cars, and had continued with success in this industry. Last year they took further works at Argenteuil, twelve miles from Paris. Already they had a great interest in the Isotta Fraschini works in Milan, and now they had the new works at Birmingham, as they fully realised the patriotic trend in motor-car purchasers. The considerable increase in the output of the De Dietrich Company resulting from the opening up of works in different countries enables the aggregate of its general expenses to be divided over a much greater number of vehicles, and permits the price of each to be correspondingly reduced. Moreover, the division of work over several departments enables each establishment to be set apart for the manufacture of one or two types only, an important factor in the production of high-grade vehicles at relatively low prices.

THE MIDLAND RUBBER COMPANY, LTD., Ryland Street, Birmingham, have reduced the prices of Midland motor tyres, plain, grooved and steel studded covers, tubes and retreading, and have issued a revised list in which the latest prices are given.

ILCO oils have been thoroughly tested for efficiency amongst the motoring public, and have won excellent opinions wherever they have been used. Those motorists who wish to test the oils should drop a note to Messrs. Easton and Malville, 85, Shaftesbury Avenue, W.C., for particulars of their latest introduction.

F. R. Fry, 76-h.p. Mercedes; Ernest de Wilton, 76-h.p. Mercedes; Guy Lewin, 80·4-h.p. Hotchkiss.

Continental Stakes: S. F. Edge, 38·4-h.p. Napier; Marquis de Mouzilly St. Mars, 39·6-h.p. Napier; Clement-Hobson, 48·6-h.p. Brasier; Corry Hurford, 48·6-h.p. Mercedes; F. R. Goodwin, 43·4-h.p. Star; O. Copper, 43·2-h.p. Metallurgique.

Naval and Military Cup: Sir George Abercromby, Bart., 58·1-h.p. Fiat; G. C. G. Moss, 27·2-h.p. Arrol-Johnston; D. G. Watt, 40-h.p. Napier; J. Bullough, 41·9-h.p. De Dietrich; Capt. S. C. Holland, 32·8-h.p. Gohron.

First Brooklands Motor Cycle Race: A. G. Forster, 7·9-h.p. N.L.G.; H. Bashall, 3½-h.p. Triumph; W. G. McMinnies, 3½-h.p. Triumph; W. W. Genu, 7·8-h.p. Minerva; E. Gwynne, 5-h.p. Vindec Special; H. A. Cooper, 3½-h.p. Triumph; E. C. W. Fitzherbert, 6-h.p. F.N.; H. Shanks, 2½-h.p. Chater Lea; G. Schink, 6-h.p. N.S.U.; F. Toman, 4½-h.p. Laurin and Klement; J. B. Hanafin, 5-h.p. Vindec Special; O. C. Godfrey, 5-h.p. Rex; A. G. Reynolds, Vindec Special (T.T. type); O. L. Bickford, 5-h.p. Vindec Special; H. A. Collier, 3½-h.p. Matchless; C. R. Collier, 6-h.p. Matchless; E. Kickham, 7-h.p. Leader (Peugeot engine); W. H. Wells, 5-h.p. Vindec Special; G. L. Evans; H. Reed; W. Pollard; J. C. Davis, 5½-h.p. Rex; F. W. Applebee; C. Hurford, 6-h.p. Griffon.

Tyre Change Plate: S. F. Edge, 25·6-h.p. Napier; J. W. Stocks, 25·6-h.p. De Dion; P. L. D. Perry, 22·5-h.p. Ford; P. L. D. Perry, 22·5-h.p. Ford.

Private Sweepstakes for Private Competitors: Sir George Abercromby, Bart., 58·1-h.p. Fiat; Clement-Hobson, 48·6-h.p. Brasier; Anthony van Hoboken, 48·6-h.p. Mercedes (and others).

The racing will commence at 3 p.m. on each day.

WATER SUPPLY CHARGES IN SCOTLAND.

THE right of water authorities to levy charges on owners for water used for washing cars used for private purposes only was brought before the committee of the Scottish A.C. by a member with a view to an opinion as to the validity of the charge being given in the general interest. The Committee caused inquiries as to the practice generally to be made, and, after taking the opinion of the Club solicitor on the subject, have authorised the publication of the following memorandum:—

Section XII. of the Water Works Act, 1863, makes it clear that where carriages are kept for private use (which includes motor-vehicles), the water used for washing them falls within the domestic supply, and cannot be charged extra. This section is incorporated into many of the Scottish local Acts, and accordingly, to a large extent, rules the question in Scotland.

Under the Burgh Police Act, however, which applies to all burghs in Scotland, with the exception of Glasgow, Dundee, Dunfermline, Greenock, and Edinburgh, or towns scheduled as having Water Acts of their own, authority is given to charge for the supply of water for washing private carriages (which would include motors), and to the extent of which this Act applies, the general provision under which the charge is incompetent is not applicable. Where, however, the burghs have private Water Acts, which have incorporated the provisions of the Water Works Act, 1863, it is believed that the section of the Burgh Police Act, under which it is legal to charge for the supply for private carriages as a non-domestic purpose, would not apply.

The Public Health Act, 1897, empowers the local authority to supply water for domestic use, and also to supply surplus water for other purposes specified in that Act. This Act incorporates the Water Works Act of 1863 in its entirety, and therefore by implication provides that water for washing private carriages is included in the supply for domestic purposes with special charge therefor.

The Committee in the course of their inquiries have discovered that numerous local authorities have been making charges for the supply of water used by hose or otherwise for the washing of private carriages (which include motors), and which charge would consequently appear to be incompetent. Regulations or by-laws or rates of charges made in terms of any Act of Parliament, under which the water supply of any district is administered, cannot create a liability for payment if the Water Works Clauses Act is incorporated in the local or other Act applicable. The Committee are satisfied at the same time that payments already made could not be recovered.

The water used by medical men for the washing of motor carriages used in professional work does not fall within a supply for business purposes.

AUTOMOBILE ACCIDENTS.

AN accident has occurred to a motor party when trying to mount Saddlescombe Hill, half way between Poynings and Brighton. Mr. Williamson was touring in his car and mistook the road after passing Henfield, encountering the very dangerous Saddlescombe Hill. About half way up the car began to run backwards and the sprag was dropped, with the result that the car turned completely over, and the occupants were thrown out. Fortunately they escaped with nothing more than a shaking and a few scratches. A passing cyclist hurried to the nearest telephone office, and in less than half an hour Mr. Moore, of Preston Street, Brighton, was on the spot with a break-down gang of six men and two cars, one of which carried the occupants of the car to friends.

ON Saturday an accident happened in Newcastle Avenue, Worksop. A motor-car belonging to Mr. Crow, of Leeds, in which were three ladies, was proceeding along the avenue, a 'bus used for conveying miners to and from Steeley Pit being in front. Both were on their proper sides and the driver of the motor blew his horn several times heralding his approach. When the car was within a few yards of the 'bus the driver of the latter suddenly drew his horse across the road with the intention of turning up a side lane, the result being that the car dashed into the 'bus with great force, throwing all three ladies out of the car. The splash-board on the left side of the car was torn off, but the car was not otherwise damaged, and although badly shaken the ladies escaped serious injury, and were able to proceed on their journey.

A MOTOR-CAR belonging to Dr. Prendergast, of Hanley, was being driven along Trent Vale, Stoke, on Saturday afternoon, when a boy named Cartlidge dropped off the back of a bread van in front of the motor-car, which passed over his head, causing injuries from which he died the same night.

A MOTOR-CAR, going from the direction of London, on Tuesday, knocked down a six-year-old boy in London Road, St. Albans, inflicting injuries to the head and hands. The car drove straight on. A young man who was with the boy failed to note the number of the motor-car, but says it was a dark brown one. The Herts police are making inquiries into the affair.

A SERIOUS collision between a motor-car and two cyclists occurred at old Windsor on Sunday evening. The cyclists were returning from Windsor, and on rounding the corner near the Wheatsheaf Hotel met a motor-car coming in the opposite direction. The car caught the cyclists, and dragged them over 60 ft. before it could be pulled up. One was pitched against a wall, and was found to be bleeding profusely. Dr. Scott attended to the cyclists, and drove one to the Windsor Infirmary, where he lay unconscious for some time. The occupants of the car took the other back to Shepperton.

ROAD REPORTS.

WHETSTONE.—Whetstone has become a dangerous place so far as motorists are concerned, the watchful police at that point of the Great North Road having lately secured several convictions at the Highgate Police Court.

RENFREW.—Of the expenditure of £9,000 on the roads of the Gorbals division of Renfrewshire, the surveyor estimates that £1,100 is due to heavy motor traffic on the Kilmarnock road as well as by general motor use throughout the district.

LEICESTERSHIRE.—Motorists who tour through the picturesque parts of the Midlands should beware of the well-known village of Evington, near Leicester. On entering the village from either end one is confronted with three of the most dangerous curves in the county, all within a couple of hundred yards. Each curve is bordered with high hedges, rendering it practically impossible for drivers of motor-cars, &c., to perceive or hear any danger ahead.

HAYWARDS HEATH.—The Haywards Heath Urban Council, owing to the reckless speed at which motorists frequently drive past dangerous crossings in the town, have applied to the East Sussex County Council to secure for them a speed limit.

SUSSEX.—The following main roads are being repaired:—Bolney and Handcross; Selsfield and Turner's Hill; Chailey North Common and Gold Bridge, Newick; King's Head, Chailey, and Sheffield Park Station; Ditchling Village and Wivelsfield; Lewes and Isfield; Ringmer and Halland; Hadlow Down and Buxted and Cooper's Green; Five Ash-down and Tunbridge Wells; Stonegate, Ticehurst, and Burwash Common; Brightling and Wood's Common; Wood's Corner and Punnett's Town; Bodiam and Junction Inn; Cripp's Corner and Staple-cross.

MIDHURST.—There is a speed limit in force at Cuckfield—the non-observance of which has led a couple of motorists to the Midhurst Petty Sessions, where fines of £5 were imposed.

The Jackson 8-h.p. Doctor's Car.

The vehicle is provided with detachable dickey seat and rear tool box, side doors, lift-up centre arm, enamelled leather Victoria hood, folding glass screen, &c.

CUCKFIELD.—The Cuckfield Urban District Council has decided to tar about two miles of roads in their area.

MERTON.—The Merton Urban District Council is taking steps to have the speed of motor-cars in the principal thoroughfares limited to ten miles an hour. The roads which are used by great numbers of motorists are High Street, Morden Road, Kingston Road, West Barnes Lane and Coombe Lane. The Surrey County Council has been petitioned with a view to its having the wishes of the District Council brought before the Local Government Board.

BLAIRGOWRIE.—A section of the Blairgowrie District Committee of the Perth County Council is considering a list of fifty dangerous places in the district which the surveyor suggests should have red triangle warning notices erected. The surveyor has also reported that it will be necessary to increase the thickness of metal coatings on the road to at least one third more than formerly in consequence of the growing motor traffic.

EDINBURGH.—At the Convention of Royal Burghs, held at Edinburgh, the Assessor for Melrose moved a resolution to the effect that Town Councils should have power to impose the ten-mile speed limit on motor-cars where they consider necessary, and that the matter be remitted to the Annual Committee. The question of the speed of motor-cars, he held, should be in the hands of the Town Council entirely, and he would safeguard this by the condition that the Town Council would not be at liberty to impose a limit until they had a majority of three-fourths or two-thirds of the Council. After some discussion it was agreed that the motion, as moved by Mr. Dunn, be adopted.

We learn that the recent successes in Norway and Sweden of the Darracq car have called forth such a number of enquiries that Messrs. A. Darracq and Co., Ltd., have decided to send Mr. H. B. Cook, with a demonstrating car, to establish an organised representation in Norway. Mr. Cook left London on Friday last week for Christiania, from which centre he will make an extended business tour throughout the surrounding countries, to fix up agencies.

FORTHCOMING EVENTS.

APRIL.

- 16th (Th.).—Leicester A.C. at Ashby-de-la-Zouch.
 16th—20th.—Easter Tour of the Motor Cycling Club.
 17th (Good Friday).—Lincs. M.C.C. meet at Mablethorpe.
 Meet of the Leeds, Newcastle, Sheffield, and Bradford M.C.C.'s at Richmond.
 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.
 20th (M.).—Hull A.C.C. and Scarborough M.C.C. at Bridlington.
 25th (Sat.).—Open Motor-Cycle Hill Climb of the Hertfordshire C.A.C.
 Opening meet of the Yorkshire A.C. at the Hotel Majestic, Harrogate.
 Quarterly trial of the A.C.U.
 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F.
 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Epping.

MAY.

- 2nd (Sat.).—Impromptu pace judging competition of the Sheffield A.C. at Ollerton.
 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
 10th (Sun.).—Targa Florio Race.
 16th (Sat.).—Fifty miles Consumption Trial of the Hertfordshire C.A.C.
 Liverpool A.C.'s opening meet of the season.
 21st (Th.)—25th.—Reliability Trial of the Irish A.C.
 23rd (Sat.).—Clipstone race meeting of the Notts A.C.
 Meeting of the Yorkshire A.C. at Helmsley.
 Meet of the Motor Union at Lincoln.
 25th (M.).—Industrial Vehicle Competition of the A.C. de France.
 26th (Tu.).—Motor Gymkhana on the links of the Ross Golf Club at Alton Court—Mr. T. H. Coombes, "Montrose," Rose, is the hon. secretary of the event.
 28th (Th.).—Visit of the Aero Club to Aldershot.
 30th (Sat.).—Meet of the Herts C.A.C. at Hatfield Park.
 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
 6th—6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
 Start of the International Touring Car Trial of the R.A.C.
 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
 17th.—Close of Prince Henry Touring Competition in Germany.
 13th (Sat.).—Hill climb of the Notts A.C. at Oakmoor.
 Speed Trials of the Lincs. A.C. at Grimsthorpe.
 15th—19th.—Scottish Reliability Trial.
 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
 27th (Sat.).—Saltburn beach races.
 Buxton meet of the Manchester and Lincolnshire clubs.
 Members of the Cheshire A.C. will participate in the Gymkhana of the Manchester A.C.
 28th (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
 6th (M.).—Grand Prix A.C.F. (Voiturette section).
 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
 11th (S.).—Provincial meet of the R.A.C. at Hereford.
 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
 18th (Sat.).—Annual Gymkhana of the Herts C.A.C. at The Grove, Watford, by permission of the president, the Earl of Clarendon.
 Meet of the Liverpool and Cheshire A.C.'s at Delamere.
 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club.
 Annual Open Hill Climb of the Midland A.C. at Shelsley Walsh.
 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

AUGUST.

- 29th (Sat.).—Meet of the Lincolnshire Motor Club at Lincoln.
 30th (Sun.).—Southend M.C. run to Great White Horse Hotel, Ipswich.

SEPTEMBER.

- 5th (Sat.).—Aston Hill climb of the Herts C.A.C.
 Provincial meet of the R.A.C. at Norwich.
 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

Secretaries of automobile clubs are invited to forward their programme of fixtures as soon as arranged.

BUSINESS NEWS.

MR. F. BULLOCK has opened large new motor showrooms, garage, and workshops in Strangeways, Manchester.

THE hire department of the Daimler Motor Company, Ltd., is now located in new premises at 112, Wardour Street, London, W.

CAGNO, who is to drive one of the team of three Itala cars in the Grand Prix, has, we learn, been doing his utmost to find a weak spot in the Dunlop detachable rims, with which his car, like those of the Bayard, Porthos, Motbloc and Austin teams, is fitted. His tests have included such performances as tearing around the course at racing speed, taking corners almost on the "wrong" side in an endeavour to wrench tyres and rims from the wheels, driving a circuit with both rear tyres deflated, at sixty miles per hour, and driving a circuit with the toggle-joints of one fore and one rear wheel rim unfastened. In short, he has done everything conceivable to separate tyre and rim from wheel, but in 200 miles, hard trying he has failed to strain, unlock, or in any way damage the Dunlop rims.

AMONGST the numerous users of Stepney spare wheels in India are the following:—H.H. Maharaja of Cooh Behar, H.H. Maharaja of Balrampur, H.H. Newab of Rampur, Maharaja of Natore, Raja Bahadur of Dighapattya, Maharaja Sir Prodyat Tagore, Raja Durga Prasad Singh Bahadur of Jherria, and the Raja Bahadur of Mahisadal.

THE models issued by the Daimler Company of their 30-h.p. car have met with a great reception by the motoring public. Although attention was first drawn to these nearly four months ago, requests are still being received, and their post-bag the other morning contained, amongst others, a postcard from Salisbury, Rhodesia, asking for one of these models, while the next turned out to be an acknowledgment from Winnipeg, Canada.

"EVERYTHING for the Motor Car" is the heading given the new catalogue of the Motor Accessories Company, of 55, Great Marlborough Street, London, W. In the course of seventy pages it fully acts up to this title, the accessories illustrated being comprehensive of everything likely to be required by the motorist on tour.

OF varied interest was the aeronautical section organised by Messrs. Spencer Bros., Ltd., at Cordingley's Show, whose photographs of scenes taken from the cars of balloons in mid-air were a centre of observant criticism. Messrs. C. G. Spencer and Sons were also busy during the week arranging for passengers for forthcoming balloon ascents, while their airships attracted much attention. Mr. J. Tucker had a good selection of aeronautical outfits. The model of the Farman aeroplane was a popular exhibit, and several types of gliders interested the public, while the three-cylinder "Buchet" motor lent by Major Baden-Powell was also on view.

WE are glad to learn from the Clement-Talbot Company that the sales of Talbot cars during March, as compared with the sales during the corresponding month of 1907, show an increase in monetary value of 70.5 per cent. That this is not simply a sudden rush of orders can be gauged by the total increase of the business over the past five months, which is 63.5 per cent. in cash value, as compared with the same period a year ago.

IN connection with the Motor Car Exhibition to be held in Moscow next month, the Organising Committee have appointed Messrs. Langstaff, Ehrenberg and Pollak, 17 and 18, Basinghall Street, London, E.C., the official shipping agents for the handling and clearance of goods for the show. The firm are in a position to give inclusive rates from any place in England to free stand Moscow, either by water via Riga or by rail via Paris, from which place they will despatch a special train consisting exclusively of goods for the exhibition.

THE receiver and liquidator of the Enfield Autocar Company has sold the assets of the company, comprising the freehold factory, plant, and stock, including a number of finished cars, to Messrs. Alldays and Onions, Ltd. We understand that it is the intention of the new proprietors to continue the manufacture of Enfield cars at Redditch, as well as the Allday cars at their Birmingham works.

FOR some time past a rumour has been prevalent in Paris that Mr. Darracq, the managing director of Messrs. A. Darracq and Co., Ltd., has the intention of resigning his position at the close of the company's current year of operations, viz., September 30th next. We are, however, officially informed that there is no ground whatever for the report in question. The existing engagement of Mr. Darracq does not expire until September 30th, 1910, and, provided his health and strength continue, he has neither the desire nor the intention to alter his relations with the company, in any case, anterior to that date.

THE DUNLOP RUBBER COMPANY, LTD., of the Manor Mills, Aston, Birmingham, have issued a new catalogue of their Dunlop solid rubber tyres for motor-buses, carriages and cabs.

MESSRS. W. GALLOWAY and Co., Gateshead-on-Tyne, have opened a depot for the sale of Stanley steam cars at 13, West Street, Shaftesbury Avenue, London, W.C.

A RECORD order for Stepney wheels has just been received by the Stepney Wheel Company from a French Cab Company, namely for 1,160 wheels.

ONE of the largest dealers in motor and cycle accessories in the Midlands is Mr. Felix Chapman, Steelhouse Lane, Birmingham. His chief lines are lamps, accumulators, plugs, oils, electric horns, chains, jacks, tyres, volt meters, &c. He has just issued a comprehensive list, which will be forwarded on application.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, APRIL 25, 1908.

[No. 477.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

A BILL providing that dog owners shall be responsible for any injury caused by their dogs, without any evidence as to previous misconduct on the part of the animal, has been introduced by Mr. J. Dundas White, the member for Dumbartonshire. Dogs have always been a nuisance to motorists, who owe many accidents to them. In the past, however, it has usually been impossible to get any satisfaction from the owner unless it could be proved that the dog had been known to bite or attack people. The Dogs (Injuries to Persons) Bill also provides that damages under £5 can be recovered under the Summary Jurisdiction Act, and in view of the forthcoming second reading our readers should endeavour to enlist the support of M.P.'s on behalf of the measure.

Roads and Wheel Design.

Not often do the provincial daily journals so seriously consider questions relating to automobilism as the "Manchester Guardian," which has just published a suggestive article by Mr. A. J. Metcalfe, C.E., who affirms that "after repeated tests and trials it has been demonstrated that a bituminous or tarry grouting or binding material for macadam roads is the most satisfactory, and when the roads are treated properly in good weather dust and mud are almost abolished, and at the same time disintegration of the road-surface is prevented." After considering various reforms in the manner of constructing roads he points out how, in the case of the railway, the permanent way and the rolling stock are always looked at relatively to each other—a point of view that he brings to bear in considering the question of roads and motor-cars. In order to cause the rain to drain quickly from the road-surface a certain amount of cross-fall or convexity is required, and to meet this convexity the wheels of traction engines, motor lorries, and so forth should be bevelled so that an equal pressure will be distributed over the whole width of the wheels and the tendency to cut or grip the road-surface will be thereby abolished.

An Engineer's Suggestion.

MOTOR lorries, according to Mr. Metcalfe, should have the driving wheels increased in diameter, if not in width, as wheels of small diameter allow but limited contact with the road-surface, and thus give a more concentrated grip, with greater grinding action and quicker wear. Motor-cars should have more free vertical space given between the road-surface and the "under-run" of the chassis or car-body, and all abrupt projections there should be prohibited, as they increase immensely the eddying and scurrying of the wind under the car as it rushes along, and blinding clouds of dust are the consequence on ordinary macadam roads. Drivers of traction engines and motor lorries could assist the road engineer by not keeping in the same track repeatedly, and so could motor-car drivers by taking turns and bends at easier speeds, which would considerably lessen the cross-friction and wear at these places and also make the roads safer for themselves and other users.

No Speed Limit for Belfast.

At length the Local Government Board for Ireland has given its decision with regard to the application made at Belfast for a speed limit of ten miles per hour. Upon full consideration of all the evidence given at the inquiry, the Board does not feel justified in consenting to the proposal, so that the matter remains as it was before the application. We congratulate the Belfast motorists upon the success of their opposition. This will, doubtless, have a good effect in assisting their organisation into a Club, in order to watch any future inroads which may be made upon the rights of those who own cars in the North of Ireland.

A Welsh Declaration.

IN connection with this matter of the speed limit we are pleased to learn that the Glamorgan County Roads and Bridges Committee, which has been considering the report of the Royal Commission for some months, has just come to the conclusion that the speed limit of twenty miles per hour should be abolished, and that the police and other authorities should rely solely upon the clause relating to driving to the public danger in connection with prosecutions. This is certainly a step in advance, for not many local bodies have yet publicly proclaimed in favour of this abolition. Those, however, that have given the matter careful consideration are gradually realising that the arbitrary twenty miles per hour cannot be supported on the ground of public safety. At the same time, we would suggest that there is need for a clear definition of what is meant by "driving to the public danger," and it should be well established that where no one is upon an open country road nor in sight the police have no authority to charge motorists with driving with disregard to the safety of those who are absent.

Advertising on Trial Routes.

THE extensive advertising which was adopted last year by tyre manufacturing companies over the Scottish Trial route gave rise to a deal of comment on the part of the public and of local authorities generally. In view of a possible repetition of the enterprise the Scottish A.C. recently took up the matter with a view to arriving at some agreement which would prevent the disfigurement of the landscape in this fashion by the erection of huge placards, hoardings, and the like during the ensuing trials. Approaches were made to the leading manufacturing companies and suggestions given to this effect which were so favourably received that a definite proposal was put forward, by which all the companies were to enter into an agreement so that from a given date until the expiry of the trials they would not send out or erect any more prominent roadway signs or placards, except, perhaps, in one or two principal towns through which the trial may pass. The Continental, Dunlop, North British Rubber, and Palmer Companies have expressed their concurrence in the proposal and their willingness to enter into an agreement on the lines suggested; but the Club inform us that the Michelin Company have written regretting that they cannot enter into any arrangement in view of the fact that they have already made arrangements for erection of road signs on

most of the principal roads in Scotland, and that these, not being yet completed, will be receiving attention at the time of the trials. Consequently the committee regret that they cannot proceed further in the matter.

Naval Men as Mechanics.

FROM time to time we have referred to the interest which naval and military men have taken in the examinations promoted by the R.A.C. for efficiency in driving and proficiency in mechanical matters. Another instance of this enthusiasm was seen at Plymouth the other day, when about 30 candidates attended an examination by the Club inspector at the motor school of Mr. Frank Davis, in Buckwell Street, Plymouth. During the last six months soldiers from various regiments stationed there have received instruction at the School, and the sailors had attended classes organised by the Admiralty. After the usual written and *viva voce* examinations a driving test was conducted through the most crowded streets of the town, including George Street, West Hoe, Mutley and Peverell. At most of the naval and military stations similar good work is being done, equipping the defenders of our country for suitable employment when returning to civil life.

Sir Charles Simeon King, Bart., and his new Argyll 16-20 h.p.

The "Reliance" Motor 'Bus.

IN Ireland, as in England, the motor-bus is becoming a recognised factor in the conveyance of people from point to point. Those responsible for the development in the Emerald Isle appear to be christening their vehicles after the manner of Hancock, Gurney, Church, and other early workers on this side. Thus, "The Reliance" is the cognomen of a motor-bus which has just gone into service in the north of Ireland for the convenience of the inhabitants of Portaferry and the regions beyond as far as Newtownards, thus linking up a district that has been without quick transit with the Belfast and County Down Railway Company's line. Parcels as well as passengers will be carried.

For Road Inspection.

CROYDON, some of the residents of which are anxious to impose a restricted speed limit on motor-cars passing through the borough, is now to employ a motor vehicle. At the last meeting of the Town Council, by a majority of two to one, it was decided to adopt a recommendation of the Road Committee to hire an automobile for the use of the road surveyor. They had obtained estimates and had ascertained that the cost of hiring a mechanically-propelled vehicle would not exceed the amount annually paid for horses and trap, the pre-

sent cost of horses, trap, and driver being £235. In moving the recommendation Councillor West pointed out that in Croydon there were 122 miles of roads; the committee employed 500 men and the surveyor was responsible for the spending of a sum of about £100,000. It was necessary, therefore, that the Surveyor should be able to get about quickly and supervise the work, and it was expected that a considerable saving would result. In the course of the discussion Count Denning said that Croydon was only a small place and suggested the purchase of a Welsh cob and a light trap—a suggestion that Councillor West regarded as extraordinary coming from a gentleman who used two motor-cars in his business.

Cars in Croydon.

THE movement to reduce the speed limit of motor-cars in Croydon, and to secure a better regulation of traffic, has received a further impetus from a meeting at which the West Ward Ratepayers' Association unanimously adopted resolutions in its support. On the other hand, the Thornton Heath Ratepayers Association, one of the largest in the borough, having discussed the same resolutions, adopted one in favour of reducing the speed of all traffic in the borough, it being pointed out that it would be ridiculous to allow tradesmen's carts and trams to go through the streets at a faster rate than motor-cars. At both meetings it was agreed that an eight-mile speed limit from West Croydon to the Swan and Sugar Loaf Hotel was desirable. At the Thornton Heath meeting a letter was read from Dr. Jackson, the borough coroner, in which he mentioned that he had held several inquests on people killed in the borough by motor-cars, but in no case had there been any proof whatever of fast or reckless driving. He believed the public outcry against motor vehicles, and the heavy penalties inflicted, had done much to impress motor drivers of all sorts with the risk they ran in travelling up to anything like the present legal limit in main roads, such as the Norbury-to-Purley route. Personally he was not in favour of doing anything at present.

On the Sands at Saltburn.

THE arrangements have now been completed for the holding of the annual speed trials of the Yorkshire Automobile Club on the sands at Saltburn on Saturday, June 27th. Owing to considerations of tide it will be necessary to commence operations at half-past eight o'clock in the morning, but, although this may cause a little inconvenience, it will remove many of the difficulties which occurred last year, when the trials began at two o'clock. The course itself will be a kilometre in length, but the sands will be roped off for a distance of two miles. The finishing post will be opposite Agar's Gap, which allows half a mile for the cars to pull up in. It is hoped that many prominent racing motorists will take part in the trials. The Hon. A. Lee Guinness will attempt to create a world's record for the flying kilometre. Amongst the other competitors who are expected to take part are Mr. Warwick J. Wright, Mr. A. Farnell (Bradford), and Mr. R. Winn (Leeds). There will be fifteen events in all, and amongst those who have promised cups are Earl Fitzwilliam (president of the club), Mr. D. H. Thornton, of Birkenhead (vice-president), and the various branches of the Yorkshire A.C. In our "Club News" we refer to the programme in greater detail.

An Australian Hill Climb.

ON the 14th ult. the Automobile Club of South Australia held a hill-climbing contest at Burnside, near Adelaide, over a course 4 m. 148 yds. long, and with gradients ranging from 1 in 25 to 1 in 8. In that district the speed limit for motor vehicles is 20 m.h.p., and for "this occasion only" the Attorney-General had suspended the operation of the Motor Vehicles Act passed by Parliament last year—a concession that was necessary, as the winning car made an average speed of nearly 26½ m.p.h. The contest was the third and last of a series for a trophy presented by the president, Mr. T. Barr Smith. On the first trial

there were more than thirty contestants; they fell to seven in the concluding event, the first three in the end being Mr. H. Low Smith on his 20-h.p. Talbot, Mr. R. Morton on his 12-16-h.p. Talbot, and Mr. V. Lewis on his 10-12-h.p. Talbot, their respective times for the climb being 9 min. 17 sec., 11 min. 13 sec., and 14 min.

A Ballooning Party.

MOTORING having lost its early excitement, country folk are now taking to the air, and the balloon party at Lord Llangattock's lovely place near Monmouth at Easter is evidence of the advance. The well-known aeronauts, Count d'Oultremont, president of the Belgian Aero Club, and Count Castillon de Saint Victor, one of the founders of the Aero Club de France, came to England to join the country house ballooning party which was given by Lord and Lady Llangattock for their son, the Hon. C. S. Rolls, at their seat, The Hendre, Monmouth. Four balloons were taken down to Monmouth for ascents in the neighbourhood on Saturday, Monday, and Tuesday. Among the guests were the Hon. Claude Brabazon, who took part in the Gordon Bennett race in America last year; Captain Grubb, R.E., of the War Office, who

regis of the Institute of Chauffeurs will prove useful in encouraging chauffeurs to a high standard of automobile excellence. We like the idea carried out by the Manchester A.C. at their Bamford meeting the other day, when, without any previous notice, the engines of the cars taking part in the trip were inspected for general condition and cleanliness, prizes being awarded to those most notable in these respects. These inspections will be conducted periodically by the Manchester Club, and the chauffeur who obtains the most marks at the end of the season will be given some special mark of distinction.

Seeing London.

LAST summer the Great Western Railway Company brought passengers from the country and enabled them to see London before returning home in the evening; now the system of inspecting London from the motor char-a-banc is being developed, and on Monday a number of sightseers boarded such a vehicle in Adam Street, Strand, and were driven around the historical parts of the City. In the afternoon the West End was similarly invaded, and apparently the motor char-a-banc for sight-seeing purposes is being successfully instituted as a feature of the growing varieties of automobile traffic in the Metropolis.

Racing at Brooklands.—A View of the Spectators' Enclosures on Easter Monday.

was with Mr. Rolls in the balloon race from Brussels, in which they landed on the Biscayan coast; Mr. Philip Gardner, who recently made a night trip from London to the Jura mountains, in Switzerland; Mr. Frank Butler, one of the pioneers of automobilism; Lieutenant Hilhouse, R.N., and Dr. Lockyer, a director of the South Kensington Observatory. Count Castillon de Saint Victor was identified with Count de la Vaulx in the world's longest balloon voyage from Paris to Russia, and Count d'Oultremont once crossed the Channel from Paris to Hull.

Encouraging Drivers.

It is gratifying to find automobile organisations recognising the importance of the chauffeur in the public appreciation of the motor movement. That he can play a leading part in bringing the opprobrium of the non-motoring public upon our heads is well known; that when he takes the car out without authorisation something discreditable often happens is proved week after week. When such delinquencies become known he expects some sort of disapprobation finding expression. This being the case, he has a right to look forward to some meed of praise when meritorious work is done. In London, the competitions initiated by those responsible for the Argyll and Napier cars has done something, and that now in progress under the

American Organisation.

THE motorists of the United States apparently have faith in organisation, and the American Automobile Association has no fewer than thirty State associations, comprising at least 200 clubs, within its ranks. Gradually they are endeavouring to secure something like uniformity in the legislation of the various States, and hope ultimately to get rid of the chaos that now prevails, resulting in uncertainty as to speed, &c., whenever motorists cross the boundary line of any State. Much good work is thus being done, with commendably little friction.

MOTOR char-a-banc excursions to places of interest in the neighbourhood, which proved so popular last season, were resumed at Bexhill on Good Friday.

AT Westcliff-on-Sea a number of taximeter cabs arrived in the town on Saturday, and will be placed on the cab-ranks as soon as the necessary licences have been obtained.

THE number of visitors to the Southampton district for the Easter holidays has been much greater than usual, and an important development in motor traffic has begun here with the Eastertide. There are to be daily excursions through the New Forest and other beautiful spots in Hampshire.

HOLIDAY NOTES FROM BRIGHTON.

IT would be no exaggeration to say that, during the Easter holidays, Brighton became the great central rallying point of the English motoring world. Mind you, even the most patriotic Brightonian will condescend to admit that there are other seaside holiday resorts in the country, but he rejoices in the knowledge that the perpetual attractions and traditional fascinations of his own beautiful town are a natural magnet, drawing in its direction every week-end all the year round the biggest stream of petrol-driven traffic known on any highway out of London. To some extent the motorist might almost be hailed the saviour of the situation in Brighton, for the sovereignty of the once-vaunted "Queen of English watering places" has diminished considerably in lustre—not so much through any fault of her own as because of the levelling influence of modern progress, aided and abetted by the now extraordinary accessibility of her foreign rivals. "Long-stayers" among her fashionable visitors are not so numerous as they used to be, by any means, and yet, thanks mainly to the motor-car's inspiration, her vogue as the paradise of the metropolitan week-end is stronger than ever. The business people of Brighton are hoping that Mr. Joseph Lyons' dazzling scheme for the creation of a magnificent kursaal right down on the sea front will enable the town to cry an exultant "Quits!" with Monte Carlo, Ostend, and the rest—but that is a goal that the uncertainties of Parliamentary inquisition and different factors of local opposition to the project may render a very distant outlook yet awhile.

IN the meantime, fully recognising the importance of the motoring patronage it enjoys, Brighton has risen to the emergency within the last two or three years. Spacious public garages continue to multiply in the land, and the principal hotels lay themselves out, as it were, to win the suffrages of the car-whirled, road-borne strangers within their gates. And yet a certain influential gentleman, who shall be nameless, recently tried to persuade the people of Brighton that, on the whole, her motor-travelling patrons do her no good, because of the here-to-day-and-gone-to-morrow spirit that mostly determines their movements. The enduring fascination of the car undoubtedly is a temptation to be continually "on the go"—but the Brighton hotel-keepers have their own opinions on the subject as to which class of visitor spends its money the more freely. The railway company, by-the-by, counts on "getting its own back," if the projected kursaal becomes *un fait accompli*, by means of luxurious Pullmans that are to do the journey from town within the hour.

BY Saturday night the Brighton garages, like the hotels, were crowded literally to overflowing, and it was often heart-breaking work for late-comers to secure accommodation for "man and beast." At the structurally gigantic, socially smart, and essential "goey" Metropole they had motoring visitors by the score—Mr. Alfred du Cros a unit among them—though the harassed book-keepers, appealed to for information on the subject, protested their inability to pick them out from the crowd, while the garage manager had no time to take more account of the cars committed to his charge than their numbers. The Grand Hotel hard by was bubbling over with a similar superabundance of prosperity, and its recognised garage close by, that of the Brighton and Sussex Motor Works, Ltd., which, of course, accommodates the cars of visitors elsewhere, was in a state of mechanical turmoil practically all day long. Sir John and Lady Bell, the Lord Mayor and Lady Mayoress of London, left their car there, as also did Mr. Wertheimer, of artistic renown, Lady Hope, Colonel Wyllie, Mr. Simpson Hinchcliffe, and Mr. E. Wormald, to mention just a fractional part of its Easter clients.

WITH such a plethora of traffic on the front—big touring cars and dainty landaulets gliding disdainfully past fussy, rattling, clanking little "runabouts," taxi-cabs, quite a recent

importation to Brighton, rushing to answer the imperious calls constantly ringing from the hotel porticos, and a few patrician horse-carriages and common or garden cyclists looking rather bewildered in the whirr and bustle of things, it was difficult to pick out anything particularly notable, though there was lots of it about. But one of the finest turn-outs noticed on Saturday was certainly a handsome 40-h.p. Napier, all dark green and gleaming silver, belonging to Mr. Tyzbek, of Haywards Heath. One noticed it at leisure in the garage of the Old Ship, amongst the visitors at which historic hostelry, with its nearly two centuries-old assembly room, where the fine ladies and their cavaliers of the Regency period, when George IV. kept gay Court at Brighton prior to his accession to the Throne, danced many a lively measure, were Mr. C. H. Stephens, Mr. D. B. Atkins, and Mr. L. H. Phillips, who had motored down south from Birmingham and district.

THE startling change that came over the aspect of nature on Easter Sunday qualified the charm of the road considerably. Visitors who motored down to the seaside in a fairly sunny though decidedly wintry morning were not enamoured of the return journey prospect by any means. For an hour or two during the afternoon Brighton was dim as November twilight, and a regular blizzard bore down on the scene, with driving sleet and blinding snow that ensured wholesale cancelling of arrangements for car drives in the neighbourhood. The Royal York Hotel, perhaps the most popular rendezvous of the motoring fraternity, had many callers for luncheon, and well-known personages in the professional and industrial car world. Among its visitors were Mr. F. C. Baisley, of the Gladiator company, Mr. Warwick Wright (Metallurgique), who brought a small party with him, and Mr. Bell, the manager of one of the principal metropolitan taxi-cab enterprises, who was accompanied by M. Lotery. Miss Kitty Gordon, the well-known musical comedy "star," motored down with her husband, Captain the Hon. T. Beresford, to sing at the Palace Pier concerts on Monday, while Miss Constance Collier and Miss Margaret Cooper were other artistic celebrities arriving at the Royal York.

MR ALFRED VANDERBILT, the young American multi-millionaire who is going to revive the old-time coaching traffic 'twixt Brighton and London on May 4th, and will himself drive ordinary paying passengers up and down day by day during the next six weeks, arrived by motor on Sunday morning and lunched at the Metropole.

THAT hotel, too, was the *locale* of a festive little gathering of London pressmen and others invited by the directors of the Electrobus Company to celebrate the first long-distance run of an electrically-driven omnibus out of London. Unfortunately, the vehicle itself, with about twenty expectant guests on board, fired its axle on the way, and arrived at its destination nearly two hours late. The luncheon had to get along without them, for other members of the party had taken the precaution either to motor down in the ordinary way or come by train. Mr. Thomas Garlick, representing Sir Henry Dering, who was unable to be present, presided at the "festive board," supported by Mr. Jacob Atherley, Captain Taylor, Mr. Musgrave, Mr. Roberts, and others interested in the Electrobus venture. Several of these new vehicles will soon be running in the streets of Brighton, and their many points of superiority over the petrol-driven type—with the noise and other drawbacks of which some of the populace are unpleasantly familiar—were duly emphasised during the more or less convivial speeches that succeeded a perfectly Lucullan display of hospitality. "SAXONIAN."

"TURCO" specialties of importance to the motor trade and motorist alike include the matting paint and the tyre paint of the Union Rubber and Chemical Company, Ltd., Manchester. The latter is for renovating the appearance of tyres which have become soiled or discoloured from use or long acquaintance with shop or repair establishment.

CONTINENTAL NOTES.

The Prince Henry Reliability Tour.

The entry list at ordinary fees for the Prince Henry Reliability Tour, which is to be held in June next, closed on the 15th inst., when it was found that no less than 145 cars had been entered. Germany is represented by twenty-four makers and 107 vehicles; France by seven manufacturers and nine cars; Belgium by four and eleven respectively; Italy by three and five; Austria by two and five; Switzerland by two and three; and England one maker and one car—a Napier.

The Elastic Wheel and Tyre Competition.

The spring and elastic wheel and tyre competition organised by the "Auto" of Paris came to an end in the French capital last week, when of the twenty-one cars which set out for the journey to Nice eleven safely arrived home. Each class was divided into two sections:—(a) In which no repairs and replacements of wheels or tyres could be made, and (b) in which they were permitted in those cases where the reservation had been provided for in the entry form. The awards are as follows:—Class 2, cars of a minimum weight of 1,000 kilogs.—Section A: 1, Vulpes car fitted with Ducasble tyres and driven by

Prince Henry of Prussia as Inventor.

Prince Henry of Prussia, who, as is well known, is an ardent motorist, has just applied for a patent for a method of keeping the glass wind-shields of motor-cars free from mud or other dirt which might prevent the driver from having a clear view. It is a simple apparatus, composed of two movable bands of rubber placed on each side of the glass screen. A handle within convenient reach of the driver sets in motion the two bands which pass rapidly to and fro over the glass, thus cleaning it whenever the operation is necessary.

Light Cars in France.

The tendency amongst French motor-car manufacturers to cater for the growing demand for light cars is growing apace, for it is now announced that the C.G.V. Company, who have hitherto devoted their attention to cars of relatively high power, are now introducing an 8-10-h.p. two-cylinder model and a 12-14-h.p. four-cylinder vehicle.

A Useful Warning.

In view of the exodus of cars from Paris at Easter, the notice issued last week by the Chairman of the Touring Committee of the A.C.F. urging motorists to drive their vehicles with prudence came as a timely warning. The notice points

Rigal at the Wheel of one of the Clement-Bayard Cars for the A.C.F. Grand Prix Race.

Barriaux, no time lost due to tyre troubles. Section B: 1, Darracq car with Sider tyres, 1 h. 20 min. delay; 2, Ours car with Touzelt wheels, 1 h. 45 min. delay. Class 3, cars weighing over 1,250 kilogs.—Section A: 1, Mors with Ducasble tyres; no time lost. Section B: 1, Rebours car with Sider tyres, 4 h. 55 min. delay. Class 4, cars over 1,500 kilogs.—Section A: 1, De Dion with Ducasble tyres; no time lost. Section B: 1, Rebours car with Sider tyres, 4 h. 5 min. delay; 2, Delaunay-Belleville with M.Y.G. tyres, 1 h. 58 min. delay; Class 5, cars over 1,750 kilog.—Section B: Peugeot with M.Y.G. tyres, 5 h. 42 min. delay.

Speed Trials in Algeria.

As briefly mentioned in our last issue, a series of flying kilometre speed trials was held by the Algerian Automobile Club on the 12th inst. on the road between Algiers and Boufarik, when the best time of the day was set up by Gerin on a Renault 1907 Grand Prix racer (29 sec.). In the single-cylinder car class Baron de Vivier was the fastest on his Sizaire-Naudin (55 3-5 sec.). The four-cylinder (91 to 100 mm. bore) class resulted in a win for J. Narbonne on a Pilain (49 sec.), while in the 111 to 125 mm. bore four-cylinder section the fastest time (48 3-5 sec.) was set up by Mesquich on a Turcat-Méry.

out that just now, when the French Parliament is considering the question of motor regulations, any excessive speed or imprudent driving may have serious consequences on the development of the automobile movement.

Miscellaneous Items.

Six entries have so far been received for the St. Petersburg-Moscow race, which is to be held on May 31st, viz., a Die-rich, a Fiat, two Lion Peugeots, a Diatto-Clement, and a Humber. —Three Ital'as, three Isotta-Fraschinis, three S.P.A.s, a Berliet, a Junior, and two Zusta have so far been entered for the Targa Florio race, which is to be held on May 10th. —Prince Borghese has placed an order in France for an aeroplane built to his own designs, with which he intends to carry out a series of experiments near Rome. —The Association Touriste du Morvan (France) is organising a hill-climbing competition for May 31st over a four-kilometre course on the Autun-Montgen road. —The first of the new Panhard racers for the A.C.F. Grand Prix event is now being tested on the road. —A public-motor-car service is to be established at the end of May between Reichenhall and Thunsee, Germany. —A new 24-seated single-deck steam bus built by La Société des Générateurs Économiques has just made its appearance in Paris.

A Public Motor Car Service has recently been started between Enghien, St. Gratien, and Deuil, France.

The vehicles employed are of the De Dion 12-h.p. two-cylinder type, and have accommodation for eight passengers. The illustrations above depict (1) the Garage, (2) Buses waiting at the railway station at Enghien, (3) Loading up, (4) Two of the buses hired by a wedding party, (5) One of the stopping places, (6) Passing through Enghien, (7) the terminus at Deuil.

GOSSIP FROM PARIS.

ONE of the numerous motorists who have been practising on the Dieppe circuit declares he covered it eleven times in one day. If he really did accomplish that feat, and if he should meet with no accident in the Grand Prix race, his car, which is not one of the best known, may carry off the prize. To cover the circuit eleven times in a day the speed must have been formidable or the endurance of the driver almost phenomenal, as a motorist, who has won several big prizes and who has driven round the Dieppe circuit more than twenty times, tells me that, with the good racing car he had, he could not cover the circuit in less than 50 or 55 minutes on account of the necessary slackening of speed in the towns and villages. It may be his competitor's car is swifter, and in that case the result of the Grand Prix of 1908 will be a great surprise to the motoring world.

"PUT a beggar on a horse and he'll ride to the d—l" is an old saying with much truth in it. But with the best will in the world it is impossible to drive a 6-h.p. motor-car up-hill at the speed of thirty miles an hour. A gentleman touring in the Department of the Drome, and approaching the little town of Tain, which counts only about 3,000 inhabitants, was, however, last week stopped by an officious gendarme, who pretended he had been guilty of furious driving! The owner of the little car protested in vain that the vehicle was incapable of committing the offence, so he will have to appear in the police-court to hear himself condemned to pay a fine, if not to imprisonment, because the police magistrates always take the word of the policeman or gendarme as gospel and never listen to the defence. Even if the little car, which is not much bigger than a bath chair, were to be dragged into court to prove its incapacity to infringe the speed regulations its owner would be condemned all the same. On appeal, the "delinquent" will surely be acquitted, but the stupidity or excess of zeal of the Tain gendarme will have cost him a lot of worry and several louis. Tain should be marked with a red cross as dangerous on the way-book of all English tourists.

MOTORISTS travelling from Calais to Paris must make a short *détour* on account of the building of a new bridge at Saint Rémy. On arriving at that place they should follow the road to Coquerel, Longpré, Bettencourt, and Airaines, to rejoin the main road there. In running from Paris to Calais the best road is, on arriving at Liancourt, to proceed to Bray-les-Mareuil, Caubert, and Abbeville. Among the English motorists at present in France are Mr. and Mrs. Woodward and party, 30-h.p. Dietrich; Mrs. Thurlow, 30-h.p. Delaunay-Belleville; Mrs. Fitzgerald, 35-h.p. Renault; Mr. and Mrs. Bridgeport, 30-h.p. Brasier; Mr. Cardwell, 40-h.p. Mercedes; Mr. and Mrs. Peavey, 28-h.p. Delaunay-Belleville; Mr. and Mrs. Rhodes Emmot, 20-h.p. Talbot; Lord Dunleath, 40-h.p. Siddeley; Captain C. Hamilton, Napier; Mrs. Hassell, 20-h.p. Dietrich; and Mr. Dempster, 35-h.p. Daimler.

M. ARCHDEACON is a convinced believer in the utility of offering prizes. He told me the other day that nothing could further the interests of aviation so effectually and so cheaply as the offering of big prizes. He with M. Deutsch had put up the prize of £2,000 won by Henri Farman. Well, if he and M. Deutsch had used that money in making an aeroplane he admits it is quite likely it would have been a bad one and that it would never have left the ground. Thus but little if any progress would have been made. On the contrary, by offering the prize a great impetus had been given to the movement for the conquest of the air, in which inventors had already spent ten times more money than the amount of the coveted reward. When the £2,000 were captured M. Archdeacon feared the ardour of the inventors would slacken, so he at once set to work to get other rich people to institute prizes. He rejoiced to see M. Armengaud offer his £400 to the first man who shall remain a quarter of an hour in the air, and applauded Messrs. Michelin for instituting their challengecup and £800 for the longest distance

covered every twelve months for a period of eight years, and their grand prize of £4,000 for a flight from Paris to Clermont Ferrand. But that is not enough for M. Archdeacon. He wants annual prizes of £40,000 or at least £20,000 during five years. With that reward in sight he is sure inventors would set their wits to work and effect the definitive conquest of the air in an incredibly short time. He has, with the object of founding those prizes, written to numerous millionaires, and among them Mr. Carnegie, Mr. Pierpont Morgan, Mr. Gould, Mr. Vanderbilt, Mr. Rockefeller, &c. If it is necessary he will, he says, go to America to demonstrate to them that they will never have a better opportunity of showing their generosity and of, at the same time, securing for themselves the eternal glory of having aided in the solution of a problem destined to transform the world for the better. M. Archdeacon is an enthusiast, and it is a pleasure to hear him speak of the considerable improvement in the physical and moral condition of the peoples of the world which he foresees will follow the conquest of the ethereal element by man.

Touring in France.—The Rue de l'Eglise, Dunkirk.

THE weather has not been favourable for the flights of aeroplanes, but the high wind which has prevailed many days has not prevented the flight of "canards." They have flown across the Atlantic and from all parts of Europe to the French capital. According to several of them the feats of Farman and Delagrange are nothing to those which will be achieved very shortly by the new machines being built in various countries. No doubt the Michelin prize of £4,000 for a flight from Paris to Clermont Ferrand will be captured one of these days, but, perhaps, not so quickly as some inventors imagine. Even the Brothers Wright seem to acknowledge that. Indeed, if the report which comes from Dayton is authentic, they have sold their secret to M. Lazare Weiller for the moderate sum of £20,000. I say "moderate," because not very long ago those inventors demanded four or five times that amount. I have not the pleasure of M. Weiller's acquaintance, and have not been able to ask him if the report is true, but the cablegram speaks of the sale of "patents," and till now the world had imagined the Brothers Wright had none.

MARNEY.

THE BROUHOT 9-H.P. BELT-DRIVEN CAR.

IN several recent issues we have had occasion to refer to the increasing attention which French motor manufacturers are now devoting to the construction of cars of much smaller power than those they have hitherto turned out. The Renault and De Dion concerns have, of course, always been well to the front in the manufacture of light cars, but the Brasier and Brouhot firms have not previously been associated with this class of automobile. The new Brouhot vehicle, of which we are this week able to give a description, is particularly noteworthy, inasmuch as the design is of an exceedingly simple character, the main drive being by belt—a form of transmission which has, in France, been usually looked upon with disfavour.

The frame, which is of pressed steel construction, is supported on semi-elliptic springs at the front, while those at the rear are, as will be seen from Figs. 1 and 2, of special design, they being practically halves of long semi-elliptics. The engine is of the vertical single-cylinder type, 105 mm. bore by 130 mm. stroke; it has mechanically-actuated valves, and is mounted at

Fig. 1 and 2.—Elevation and Plan of Chassis of Brouhot 9-h.p. Belt-driven Car.

right angles to the usual position—that is to say, the crank shaft is parallel with the axles. The ignition is by high-tension magneto, and the water circulation on the thermo-syphon system, no pump being employed. A special form of carburettor furnishes the mixture, the air and fuel inlets being varied in accordance with the position of the throttle. Coming now to the transmission, reference to Fig. 2 shows that, mounted on the side of the extended crank shaft, is a pulley driving through a long wide belt a similar pulley on the end of the change-speed gear shaft in front of the rear axle. Three speeds and a reverse are available; the second and third speeds are direct to the live axle through one or other of two pairs of pinions, while the first speed and reverse are obtained by intermediary gears. The belt, which is entirely protected from mud and dirt by an undershield, has not to be shipped on to loose pulleys to disconnect the engine from the driving wheels as in the old form of belt transmission; instead a cone clutch is mounted within the rear belt pulley so that this can be converted into a fast or loose pulley as desired, by means of a pedal. The usual order of brake control is reversed—a pedal actuates the internal ex-

panding brakes on the hubs of the hind wheels, while a hand lever brings the enclosed one on the differential into action.

Before putting the new car on the market the Brouhot Company, whose works are at Vierzon (Cher), France, have submitted it to extended trial and claim that the vehicle, from its general simplicity and liberal proportions, is extremely low in up-keep cost. It is being made in two lengths of chassis, one for a two-seated car and the other for a light side-entrance four-seated phaeton.

SOME USEFUL NOTES.

MOTOR-HORNS which have been exposed to the rain and dust occasionally refuse to sound. If the india-rubber bulb is taken off and a piece of thin paper passed between the lips of the horn this will clear the obstruction. Care must, however, be used not to open out the lips when doing so.

IN engines which have separate exhaust pipes and no compression taps a cylinder which is missing may easily be detected by dropping a little—a drop or two is enough—water on the exhaust pipes. Needless to say, the water is not converted into steam by the exhaust pipe of the offending cylinder.

A LEAKING or broken petrol pipe is a somewhat annoying accident to be met with on the road, but it may be temporarily repaired by cutting out the leaky portion and joining the severed ends by means of a short length of rubber tubing of suitable size, the connecting ends of the rubber being bound by wire to their respective ends of the copper pipe. In the absence of a soldering iron for making a permanent repair, or of rubber tubing, one may be able to drive a few miles with the following makeshift:—Take narrow strips of cloth, torn from a handkerchief, soap them well, and wind tightly over the junction of the broken ends, which should first have been filed off squarely; then take adhesive tape and wind firmly over the cloth, beginning at quite a distance beyond it in each direction.

THE best method of getting at an unknown trouble, *e.g.*, loss of power, is to eliminate the different probable sources of trouble one by one, as by this method the cause of the difficulty can always be found. After trying and renewing, if necessary, the inlet valves, do likewise with the exhaust, and whilst with the exhaust examine the timing and make sure that this has not been interfered with. Next pass on to the ignition, and see if the accumulators (if these are used) are fully charged, or, at any rate, showing four volts. Many a time have weak accumulators been found at the bottom of an unknown trouble. Unless the car is missing fire badly the contact may be left alone, as this cannot alter; but, of course, if the car has been in other hands, it is well to see that the firing cam is correctly set. The carburettor is an article which, unless it is either stopped up, or flooded, cannot alter itself. A thorough cleansing of a carburettor with petrol is, however, a very good thing.

IN the work of taking apart the mechanism of a car great care should be taken to so arrange matters that no mistakes may be made when the parts are put together. When gears are unmeshed which have to do with the timing of the valves or the ignition, they should be so marked that they can be remeshed in the same relation. The usual way of accomplishing this is to mark the tooth of one gear of a pair and the two teeth of the other gear, between which this tooth meshes, by means of a prick punch and hammer. If the caps are taken off any bearings or bushes are removed it is essential, unless the exact manner in which they should be replaced is perfectly obvious, that these parts should be so marked as to permit of no doubt. The mixing of the halves of split bushes from different pairs of the same sizes should be guarded against, and the confounding of upper and lower halves should be avoided. Unless these precautions are observed, it is quite possible to bind a shaft in reassembling.

ARIEL MOTORS, LTD., have lately supplied a 30-40-h.p. Ariel car with special double phaeton body to Senor Joao da Fonseca Cruz, of Lisbon.

In Bondgate Without, at Alnwick, the Northern Garage, Ltd., have an extensive depot, from which they conduct a large business in hiring motor cars.

OUR advertisement columns often contain interesting news, as, for instance, last week's *Journal* had an invitation from the Municipal Council of Johannesburg for tenders for a self-propelled ambulance carriage.

THE Board of Trade has ordered the promoters of the Barton-Immingham Light Railway to provide a bridge in lieu of the proposed level crossing of the road in the parish of Barrow-on-Humber—a policy that should become general.

THE long distance Trial of Elasties-filled tyres has come to an end. Up to the time when we went to press more than 2,700 miles out of the 3,000 entered for had been completed, and a non-stop performance had characterised the run each day from the start.

THE value of the motor-cars and parts exported from the United States during February last amounted to only £69,672 as compared with £88,740 in the corresponding month of last year. The United Kingdom heads the list with £25,470, Italy being second with £12,756.

THE Oxford Watch Committee have received a formal application for the licence of twenty motor-cabs, to commence plying for hire on May day. It is stated that local cabdrivers will be given an opportunity to drive the new vehicles, and in this way the displacement of labour will be avoided as far as possible.

WHAT is the greatest height to which a car has ever been? Messrs. Willways, motor agents, Bristol, have just received a letter from a gentleman who is in the Government employ in India, who writes that he has driven his 10-12-h.p. Humber four-seater to a height of 4,300 feet above sea level. On the drive they rose 4,000 feet in twenty miles, and some of the corners required three reverses to negotiate.

A POLICEMAN in plain clothes has been signalling drivers of motor-cars passing through Llanfair to stop. One of his victims, who was charged at the Menai Bridge Petty Sessions, explained to the magistrates that all kinds of people tried to stop him, and on one occasion after he had been stopped he was told that his wheels had been revolving—not, by any means, an isolated instance of such obvious knowledge being communicated to motorists.

THE official opening of the garage of the Oldham Motor Company, Ltd., at the Harding Carriage Works, Werneth, Oldham, was an occasion of much local interest. Councillor W. T. Cooper is the chairman, and Councillor Bulloch the vice-chairman of the directorate, with Mr. R. R. Eglin as manager. The concern promises to attain considerable prominence among the business establishments of the town. There is accommodation for over thirty vehicles in the garage, and a very large shop for repair work.

AMONG the lubricators that have attracted attention at both the Cordingley and Olympia Shows has been the Noakes system of positive sight feed lubrication shown by Messrs. B. M. and W. D. Fair and Co. By means of this device the oil is forced direct to the cylinders and bearings, the motorist being able to watch it doing its work. By a few movements of the compressed air pump a pressure of 15 to 20 lbs. is indicated on the dial, which is all that is necessary until the oil tank requires refilling. The oil is forced through a liquid (half glycerine, half water), and rises in any required number of globules per minute, and from thence, still under pressure, through the feed pipes direct to the engine and bearings. The valves regulating the supply can be quickly adjusted, and automatically lock themselves on the patent locking bar. The liquid magnifies the oil passing through it, and a stoppage in any particular feed pipe can be instantly detected by the oil ceasing to rise through the corresponding sight-feed glass.

THE receipts from motor-fine in the Kingston Petty Sessions Division for the quarter ending March 31st amounted to £1,000.

By nineteen votes to sixteen, the Bradford City Council has authorised an application for power to borrow £1,250 for the purchase of a petrol fire engine.

THE Atlas Engineering Company, Ltd., Manchester, has been registered with the Registrar of Joint Stock Companies. The primary object of the concern is to manufacture on a large scale their patented resilient road wheels, which are now being used, among other firms, by the Daimler Motor Company, Ltd., the Wolseley Co., and the Vanguard Motor Omnibus Company, Ltd.

WE illustrate herewith a new type of silencer, which is being supplied by Reo Motors, Ltd., as a standard fitting to the new 18-22 h.p. Reo "Flying Greyhound," which renders the exhaust most silent with a minimum back pressure. It will be observed that the silencer is of exceptionally large diameter, and that the end plates are securely fixed to the main part of the apparatus by four long bolts, which pass through its entire length. The photograph also clearly shows a "cut-out" which is fitted at the end of the union of the exhaust pipes. The

powerful spring seen at the extreme left closes the free passage, when naturally the exhaust gases pass through the silencer. When the wire cable is pulled, the spring is then extended and the cut-out is opened. One of the special features of the device is the method by which it is brought into operation, this being by a small pedal placed on the extreme right of the footboard; a small catch is fitted so that it is not necessary to keep the foot continuously on the pedal when it is desired to make use of the cut-out.

DURING the Easter holidays many London motorists went as far as Marlborough, seventy-five miles from town, where the Ailesbury Arms Hotel has a good garage with two inspection pits.

THE Institute of Chauffeurs, Ltd., are organising a Proficiency Competition which is free to all professional chauffeurs in private service. This closes on July 31st, and those desiring to compete for the gold and silver medals as well as the money prizes should attend with their cars at the Victoria Street Garage, 94, Victoria Street, Westminster, S.W., any week day on or before that date between the hours of 3 and 5 p.m. The winners adjudged will be those who obtain the highest number of marks in the following order:—(1) references, (2) condition of engine and gears, (3) condition of body lamps, brass work, &c., (4) general smartness and civility, (5) an examination paper on special points in driving and roadside repairs.

IN Union Street, Plymouth, Messrs. Collins and Sons have an extensive motor repair shop.

THE Earl of Ilchester has ordered a 42-h.p. chassis from the Daimler Motor Company, Ltd.

A MOTOR depot and garage has been opened in the St. Andrew's Road South, St. Anne's, by Messrs. Richard and Herbert Lonsdale and Mr. Preston.

MESSRS. G. MAIN AND CO. have a well-equipped garage and motor work shop in the Parade, Leamington Spa, which has been well patronised during the holidays.

THE Daimler Company have again been honoured with an order for a Daimler car from the Prince of Wales. His Royal Highness has now purchased four cars of this make.

THE Legislature of Prince Edward Island has voted a resolution favouring the exclusion of motor-cars from the province, and will shortly introduce a Bill to carry out the resolution.

SOME interesting tests have lately been carried out at the works of the Electric Ignition Co., Ltd., Sparkbrook, Birmingham, which demonstrate the high degree of operation and low current consumption which have been attained with the E.I.C. ignition coils. The tests, which were made on a four-cylinder single trembler coil, using a 4-volt current throughout, were as follows:—A, running at continuous discharge with gap at atmospheric pressure; B, running at continuous discharge with gap under pressure; C, running through commutator with gap

at atmospheric pressure; D, running through commutator with gap under pressure. The results obtained were:—Test A—Current used $1\frac{1}{2}$ amps., sparking perfectly regular, 9,000 sparks per minute. Test B—Highest pressure 200 lb. per square inch, current used $1\frac{1}{2}$ amps. Test C—Sparking regular, one spark per commutation up to 5,000 revs. of engine; current used $\frac{3}{4}$ amp. Test D—Sparking regular at one spark per commutation up to 5,000 revs. of engine, under 150 lb. pressure per square inch, current used $\frac{3}{4}$ amp. The E.I.C. coils, of which we give an illustration, are of the highest grade manufacture and are guaranteed for two years.

AT a meeting of the Mechanical branch of the American Association of Licensed Automobile Manufacturers lately held in New York, Dr. Charles Edward Lucke, of Columbia University, who has been making some very exhaustive tests with alcohol, as a fuel for internal combustion engines, delivered an address on the subject. Dr. Lucke's remarks were principally in making comparisons in the tests he had made with the use of alcohol for automobile engines as compared to those for stationary use. He pointed out that with certain types of motors he could start with alcohol as easily as petrol by the use of a spray carburettor with the ordinary needle valve. He did not feel that the time was opportune for a universal adoption of alcohol for practical use, especially in automobile engines, owing to the absolute necessity for a minute adjustment of the carburettor and the ignition which could not be had in motor-cars, owing to the inexperience of many drivers and owners.

A MOTOR garage together with repair shop is being opened in Denmark Street, Middlesbrough, by Messrs. Day and Hanson.

THE Daimler Company have received an order from the Right Hon. the Earl of Harrington, of Elvaston Castle, for a 36-h.p. Daimler detachable limousine.

MR. R. C. LEHMANN, M.P. for Harboro', while motoring near his house at Bourne End, Bucks, last week, sustained a broken wrist through the back-firing of his car.

THE Corporation of Glasgow have consented to draft a new bye-law making it an offence to throw on the streets glass or other materials objectionable to users of rubber tyres.

WHAT is claimed to be the oldest house in the United States has lately been converted into a motor garage. It is located at St. Augustine, Fla., and was built 343 years ago, in 1565.

THE Briarcliffe Trophy Race, which is to be run on the 24th inst., is attracting considerable attention in the United States. The contest is over a course of 300 miles, and the competing cars include a Maja, Fiat, Bianchi, Renault, Panhard, as well as several of American origin.

THE New York Taxi-Cab Company has adopted the word taxi-cab as a trade mark, and, claiming that they coined the word on or about May 9th, 1907, and have since continuously used it, are issuing a general notice warning all persons and corporations against the use in any manner, shape or form of the word "taxi-cab" in respect to motor-cabs or vehicles of any other kind.

MUDIE'S SELECT LIBRARY, LTD., have recently instituted a system of book delivery by motor-vans within a ten to twenty mile radius of London. Each car is in charge of a competent man, who fully understands the whole of the inner working of the library service, enabling books to be exchanged as advantageously as at the head office. The service is, we learn, running quite smoothly and satisfactorily, and will be a permanent feature.

MR. E. R. HEWITT, who has been experimenting with alcohol for industrial motor vehicle purposes, recently gave some interesting data on the results of his work, at a meeting of the Mechanical Branch of the American Association of Licensed Automobile Manufacturers. Mr. Hewitt adapted an engine to the use of alcohol for a five ton truck. On petrol, with a full load, the vehicle ran $4\frac{1}{2}$ miles per gallon. On using the motor without readjustment, only over two miles per gallon of alcohol could be obtained, but on raising the compression from 75 to 120 pounds he was able to get over five miles to the gallon of alcohol. He pointed out that it was necessary in this case to place the carburettor as near the engine as possible in order that the mixture would be sent into the cylinder at not less than 72 degrees. In cold weather he was able to overcome the loss in the vaporisation by surrounding the admission pipes with the water jackets, which kept an even temperature for the vapour until discharged into the cylinder.

THE Victoria Garage, St. Stephens Road, Norwich, have recently installed a special electro-magnetic dynamometer in their garage. By its means the purchaser of a vehicle can ascertain whether he has the horse-power that is guaranteed by the seller. The device consists of six essential parts, viz.:—(1), the magnetic brake; (2), the brake shaft and rollers; (3), the idle shaft and rollers; (4), the tachometer; (5), the holding back and holding down chains; and (6), the controlling switchboard. The machine is so arranged as to enable the operator at the latter to control the speed and braking effect on any car fixed to it. The brake is capable of absorbing, under normal conditions, energy amounting to 40-h.p. when running at 760 r.p.m. The idle shaft, as its name denotes, is used to run idly and act merely as a guide to keep the motor wheels in their proper place. The holding back chains are for the purpose of preventing the car leaving the rollers. They are attached to the back axle, and can be adjusted to the required extent by the use of an ordinary spanner. The tachometer is arranged so as to give direct readings in miles per hour, and also in revolutions per minute, the latter being used for calculating the horse-power, and the former to enable the driver of the car to know the speed at which he would be travelling if he were on the road.

EASTER NOTES.

OWING to the very cold and wintry weather, there were not so many motoring visitors to Cheltenham this year as last. Among the visitors to the Queen's Hotel were Sir Walter Vaughan Morgan, of Brecon, on his Panhard, Mr. E. W. Hann, of Aberdare (Lanchester), Mr. Morice, of Datchet (Siddley), Mr. Johns, of Winchester (Winton), and others on various cars, including six Daimlers, three Minervas, two each Darracqs, Humber, Itala, and Mercedes, as well as Argyll, Berliet, De la Buire, De Dietrich, Fiat, Napier, Thornycroft, and Belsize.

DROITWICH, as a motoring centre, is becoming more generally recognised, to which the well-made macadam roads radiating from the town naturally contribute. The motoring visitors at the Worcestershire Brine Baths Hotel during the Easter Holidays included Messrs. G. Neilson (40-h.p. Napier), E. H. Thurburn, of Rothiemay, N.B. (15-h.p. Siddley), A. L. Wigley, of Nottingham (20-h.p. Beeston Humber), F. Johnson, of Mansfield (15-h.p. Humber), and D. M. Hollins, of Manchester (50-h.p. Leon Bollee).

A LARGE number of motoring parties have been visiting the town of Fowey.

COMPLAINTS of the excessive speed of motor-cars in Weston-super-Mare have lately been frequent, especially in the Locking road (i.e., the Bristol road). If the speed is persisted in there will be trouble. At present police traps are almost unknown in this county, and local car-owners strongly object to strangers giving the police an excuse to take action.

THERE were a goodly number of motorists at Leamington Spa for the holidays, several well-known faces from Coventry being seen at the Clarendon Hotel.

IN view of the fact that the steam roller is generally *en evidence* in the Lake District in March and April, motorists journeying thither have paid particular regard to the road-repairing work on the Windermere-Grasmere-Keswick road, as well as others in the locality. Beyond Ambleside the road has been in excellent order as far as Dunmail Raise. The new descent to Wythburn is in perfect order, but motorists who wish to take the western shore of Thirlmere will find the turn at the bottom even more awkward than before, the angle being acuter. Another £20 would have doubled the value of this improvement. Keswick has just got rid of the roller from its streets, and the continuation of this road to Cockermouth by either side of Bassenthwaite Lake is free from trouble. The Borrowdale road from Keswick is damp and bumpy as usual up to Lodore, and then is in average condition up to the head of the vale, as is the alternative route along the west of the lake. A new road has been made by the Honister Slate Quarries up to the summit of the pass, which can be used on payment of 1s. for a motor-car, as we learn from the "Manchester Guardian." It dives off with a bold zigzag to the right immediately on leaving Seabothel, and, having a more uniform gradient, will in time be a much easier road.

AT Dover the proportion of motorists among the visitors was distinctly notable. Just before the holidays a second large garage was opened, in connection with the Lord Warden Hotel, for the accommodation of visitors' cars. Both garages were crowded with vehicles during the Easter.

AT Matlock Bath many motorists have been staying, and among the visitors at the Royal Hotel, Matlock Baths, during Easter were Messrs. Wade, Hull (Daimler), Moor, Hull (Darracq), Jonas, Sheffield (Darracq), Howell, Sheffield (Daimler), Adams, Sheffield (Humber), Tallent, London (Ariel), Gamble, Rainhill (Fiat), Harris, Calne (Daimler), and Allen, Worksop (Swift). Elsewhere in Derbyshire many motorists were seen on the road, and quite a record number passed through Buxton, where Mr. G. W. Hodgkinson's garage was busy in attending to their wants.

AROUND LAMPETER BY MOTOR-'BUS.

MOTOR-'BUS services are now getting into swing for the season, and from all quarters news of the popularity of this means of reaching unknown corners of the land reaches our office. Motor char-a-bancs, too, will be largely employed, and altogether the public employment of motor vehicles is likely to receive a great impetus this year.

Meanwhile the Great Western Railway Company is getting its fleet of a hundred motor-buses into order, and we are able to reproduce a familiar scene outside the railway station at Lampeter. It is through the ancient and interesting capital of Carmarthenshire, and by the line running thence northwards through the "sweet shire of Cardigan" to the sea coast, that the holiday-makers of Swansea, Cardiff, the Southern Marches, Bristol, Bath and the West of England generally reach the "Garden of Wales." The vehicle has seemingly only just quitted Carmarthen when the traveller finds himself amongst the oak-clad gorges of the Gwili, and begins to realise the fact that the approaches to the "Garden of Wales" are scarcely a whit less beautiful than the Garden itself. Now he looks down on winding brooks as clear as crystal, on thatched cottages of indescribable quaintness, on gardens bright with flowers, on verdant hedgerows, or on broad expanses of common land thickly studded with patches of golden gorse; now the eye rests

on tree-covered slopes, shady glens, and, looking upwards, on mountain tops standing out boldly against a sky almost Italian in the deepness of its colouring.

Lampeter is only nine miles to the north of the haunts of Lewis Glyn Cothi, and as we descend into the valley of the Teify (declared on competent authority to be the finest trout stream in all Wales, to say nothing of its salmon and sewin) a view may occasionally be enjoyed of the Carmarthenshire lowland, spreading away seaward in the direction of New Quay, Aberayron and Aberystwith. It was a place of note long before it became the Alma Mater of the Welsh "Church Establishment," and there arose on the banks of the Teify certain collegiate buildings of reposeful aspect, sufficiently important to remind one forcibly both of the Cam and the Isis. The modern stronghold of Welsh clericalism is every whit as picturesquely situated as the citadel of the Calvinistic Methodists. St. David's College has the power of conferring degrees, and possesses a hall, quadrangle and chapels with the other architectural appurtenances of the educational system practised at Oxford and Cambridge. Lampeter is certainly one of the beauty spots of the Cardigan hinterland, and is always looked upon with affection and veneration by those who receive their classical and religious training within the walls of Bishop Burgess's useful and carefully maintained foundation. From Lampeter four or five most agreeable excursions may conveniently be made. There is a public motor service to Aberayron, and then the visitor can go by the same means of transit on to Aberystwith, keeping close to the coastline and passing through Llanrhystyd, or, by arranging for a special car, one may follow the course of the Teify to its junction with the sea beyond Cardigan.

ACCESSORIES FOR SPRING TOURING.

AMONG non-skids which have attained considerable popularity with motorists is the Ryley detachable device, introduced by Mr. J. A. RYLEY, 234, Martineau Street, Birmingham. This is of the chrome leather type, and is fitted with steel rivets securely inserted. The "Ryley" detachable non-skid has merits of durability, and those who favour this type will be interested in the ease with which it can be taken from the tyre. In the new list for the season which Mr. Ryley has issued are illustrations of many standard accessories, including the "Heron" motor pump, in a size which makes it specially suitable for garage use, in which connection it will doubtless be seen by motorists when on their spring tours.

Exhaust Valve Removers.

In our last issue we referred to the B. K. Simplex valve spring compressor brought out by Messrs. BRANSOM, KENT AND CO., LTD. This is illustrated in the accompanying sketch. The same firm have also an exhaust valve remover, adjustable to suit any type single-cylinder engine. The "Duplex" adjustable valve spring compressor for two, three or four cylinder engines is also marketed by Messrs. Bransom, Kent and Co. This compresses two springs, at the same time holding spring and collars in position, while the inlet or exhaust valves are removed for examination, cleaning or regrounding.

Fig. 1.

Wind Screens.

One of the important matters which motorists will do well to see to at this season of the year is the fitting of wind screens calculated to effect the purpose of protection from the weather with the least possible trouble in getting into position. One of the first firms who recognised the necessity for the folding screen for motor-cars was Messrs. LOWE, BEVAN AND CO., of the Clarence Works, Birmingham, and they have a selection of such devices for cars of all types. One of their notable patterns is the "Pioneer," in which the top glass frame is automatically raised by patent telescopic tubes fitted with springs, and regulated to the required line of vision by thumb screws in the centre of the telescopic tubes. No time need be occupied in unscrewing the glass frame, this being released by its fastener, and automatically rising to the required position. The "Combination" folding wind screen is another interesting device. This can be used in five different ways, namely, (1) as a straight screen, (2) half, (3) bottom half angled, (4) top half to open outwards, (5) bottom half straight and top half angle towards the steering wheel. We have also seen the "Kenilworth" folding screen, the fittings of which are so arranged that the bottom half of the device can be regulated at any required angle. It can also be used with the bottom half in upright position and the top portion inclined towards the steering wheel. If necessary, the "Kenilworth" wind screen can be used as a straight screen, and should it be desired, half folded down to form a half screen. It does not matter in which of these positions the screen is placed, as all the divided glasses are wind and rain proof. These specialties of Messrs. Lowe, Bevan and Co. are characterised by substantial work, and good finish, which combined with excellent design, have given them favour among motorists.

A Safety Lamp for Garages.

Too great care cannot be taken with regard to the avoidance of fire in houses and stables where motor-cars are kept. It is generally known among those who own cars, considerable risk is caused by the ignition of the vapour from petrol by the use of open lights in garages. Even in ascertaining the causes of breakdowns on the road at night-time, care should be taken. Hence we welcome the excellent safety lamp for the use of motorists brought out by the UNITED MOTOR INDUSTRIES, LTD., of 45 and 46, Poland Street, London, W. These are made in two sizes, viz., (1) that for the inspection of the car in the motor house and for the repair outfit on the car, and (2) that specially designed for fixing in garages. The lamps occupy but little space, and will burn well in a high wind, while the low prices at which they are supplied should commend them to our readers as an economical and efficient precaution against fire and explosion.

The Rotax Speed Indicator.

In the spring the motorist's fancy rightly turns to thoughts of travel. Then it is that the desire to know something of the extent of his

journeys comes upon him; more than that, the magisterial procedure in police courts has warned him of the wisdom of having some accurate mechanical answer to the assertions—often mechanically made by force of habit—of the constabulary officers who waylay those who motor. Recently we investigated the merits of a new indicator and recorder, which the ROTAX MOTOR CO., of 43 and 45, Great Eastern Street, London, E.C., are bringing to the notice of motorists. This not only registers the speed at which the car travels, but it declares with unerring fidelity the actual rate at any particular period of the journey, thus giving the owner a most effective answer should constables exaggerate and sergeants set down aught in malice. The device is in a compactly arranged case, and combines a timepiece, a mileage indicator, a trip recorder and a speed recorder. As will be seen from Fig. 2 there are four dials plus that which occupies the central position, but which is removed for the purpose of the illustration, in order to explain the mechanism more clearly. At the top is the clock, set by means of the key which opens the instrument. Three dials are employed in connection with the mileage recorder; that to the right indicates distance 0 to 100 miles, and is intended for daily use. To the left are smaller dials, one showing up to 1,000 miles, and the other indicating up to ten times that distance. The speed dial gives the speed in miles per hour. The Rotax instrument has a flexible shaft, with a screw connection to the recording device. The other end is fitted to the front wheel of the car. Every working part of the device is gear driven. In the sketch M is a sealed compartment, within which is a disc, which receives motion from the shaft, and communicates it to a wheel. The turning movement affects a screwed spindle, the motion of which is checked by gearing mechanism at the lower portion of the device. Below M in our illustration is seen the spindle engaging with the indicating pointer on the front of the instrument.

Fig. 2.

The recording takes place on a tape contained in N. This is unwound, passing behind the time-indicating pointer T. From this it is led behind the carrying roller P. R is a spring on the winding roller S, which secures the tape in its taut position. The tapes are supplied in any readings—4 to 30 m.h.p., 10 to 80 m.h.p., 15 to 120 m.h.p., and so on. The recording pointer consists of a steel point, which scores a white line on the blue perforated paper, and enables the motorist to see at what particular speed his car was travelling at any particular hour. The machine has the appearance of being a "good engineering job," is strongly constructed, and admirably designed. The Rotax Motor Co. have such confidence in their device that they guarantee every speed indicator for twelve months—an assurance that is warranted by the excellent lines upon which it is made.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

POPULARISING BROOKLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The authorities at the B.A.R.C. have not yet learned the way to draw the crowds; the relaxation of much of the stringency that disconcerted early friends of the course has done something to create a better feeling, but much has yet to be done.

Cannot the public be interested? On Monday the thing that the public liked best of all was to see the way in which the tyre of the Ford car was inflated and the vehicle speeding again before the De Dion was set going. That provided the element of uncertainty in full view of the spectators. They were not quite sure of the result until they saw the cars under the winning flags. And they voted that the best event of the day.

Now we need not transform Brooklands into a circus; but more of such events will have to be introduced if the crowds are to flock to Weybridge on race days. Why not let the starts and finishes all be in full view of those who pay half a crown to have a fleeting impression of a car travelling in the distance.—Yours truly,

ONE WHO WENT.

owing to unequal wear on the cams, also wear of the tappet guides, and it is rather a tedious job to be continually taking up wear in these parts. I always try to keep my own car accurate, and am glad to say I get very good results, but, candidly, it is a trouble, and one which very few people will probably take.

As we are on the subject of valve setting, what have some of your correspondents to say about the Adams engine which was shown at Cordingley's Show? This engine, it will doubtless be remembered, had an auxiliary exhaust, the piston uncovered small holes about $\frac{1}{2}$ in. from the bottom of the firing stroke. This relieves the exhaust valve of all pressure when it opens on the up stroke, and in my opinion, if the cooling is properly effected round the auxiliary exhaust, this system should effect a complete scavenge and give more power. This system, or rather one closely resembling it, has been tried on gas engines, but the difficulty was with the cooling of the auxiliary exhaust. Unfortunately, I had not time to go well into the Adams engine, so I cannot give details of the inlet valve setting, which I am curious to know, as the speed claimed for this engine is, I believe, about 3,000 revs. per min.—Yours truly,

INTERESTED ENQUIRER.

Mr. and Mrs. Charles Friswell on their "Standard" Six-cylinder Car in Bombay.

TWO SHILLINGS PER YARD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read that at Midhurst Petty Sessions, before Sir Hugh Wyndham and other magistrates, a farmer was fined 20s. and costs for being drunk when in charge of a horse. Evidence proved that he was trotting down hill, the cart was overturned, the horse bolted, and a constable was dragged ten yards and his arms and feet were injured.

At the same court, on the same day, before the same Sir Hugh and presumably the same other magistrates, five motorists were fined £5 each for exceeding the speed limit, and, mark you! not a word of public danger.

We submit, for the consideration of Sir Hugh and the other magistrates, that if a drunken man be allowed to drag a constable ten yards for 20s., by the rule of three, a sober motorist should be allowed the privilege of dragging a sergeant fifty yards for £5.—Yours truly,

HENRY MOORE.

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very pleased to read the letter from Mr. R. H. Grahame. A letter like this from, I presume, a private owner, is practically conclusive as to the value of this setting for this particular engine—I say "practically," as there is no mention as to whether anything else was altered. It is a well-known fact that the majority of engines can be made to run slow by carburettor alterations, but I presume in this case the valve setting was the only thing disturbed. The letter from "Ajax" is of interest, and while I quite agree with him that mathematical accuracy is desirable in valve setting, the only unfortunate part is that the valves will not remain mathematically accurate for very long,

SCREW-PROPELLED RACING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note with particular interest in a recent issue an illustration of Mr. Farman's proposed application of the aerial propeller to racing cars (terrestrial). Of course it is quite practicable, and the system has advantages, providing always that a propeller worthy of the name is used, i.e., one that does not waste half the power applied.—Yours truly,

SIDNEY H. HOLLANDS.

A CHOKED FLOAT CHAMBER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I have received many useful hints in the past from the columns of the *M.C.J.*, I venture to send you some particulars of a difficulty I recently experienced which may be interesting and useful to other readers. For some time past the engine of my single-cylinder car has caused me considerable worry. Everything appeared to be all right; in the stable it would start up on the first turn of the handle and run continuously. On the road, however, it would only run about half a mile, and then, after a slight popping sound, come to a stop. After a few minutes' delay I got the engine going again, but with the same result—another stoppage in about half a mile. Thinking the matter over quietly, I came to the conclusion that I must take the carburettor down and thoroughly examine it. During the Easter holiday I devoted a morning to the task, which proved by no means an easy one, as the nuts and bolts appear to be placed in the most inaccessible places. However, I eventually got it down, and then carefully took it to pieces. The jet, the float, the needle valve, all seemed in order. Below the float chamber I noticed four nuts; these I removed, and by a little gentle force I de-

tached the union which connects the petrol pipe with the float chamber. It was here that I found the cause of the trouble. The union is T-shaped, and was choked with a dull-red sediment, as was also a fine wire gauze—of the existence of which I was previously unaware—between the union and the float chamber. After giving all the parts a good clean out I re-assembled them and after some delay got the carburettor once more into place. Although the work took considerable time it was well spent, as the annoying stoppages have ceased to trouble me. In future I mean to give occasional attention to the clearing out of the union, notwithstanding its inaccessibility.

While on the subject I should like to give vent to a grumble against designers. Why do they put those parts that require attention in such unget-at-able positions? On my car, for instance, not only is it difficult to clean out the carburettor, but it is almost impossible to do anything to the water circulating pump.—Your truly,

SUBURBANITE.

DETACHABLE RIMS v. DETACHABLE WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having been a reader of your most valuable journal for some time, I noticed in a recent issue that "Old Motorist LC 6325" is in trouble with mounting tyres. Detachable rims are a little comfort, if only to

so great a convenience at all times that I think my experience may prove of interest to many of your readers who may not be aware of its advantages.—Yours truly,

C. G. E. STEVENS NASH.
Capt. R.G.A.

THE LOCATION OF THE ACCELERATOR PEDAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No car is now reckoned complete without an accelerator pedal, and the position in which this is placed has an important bearing on the general ease of control. Its usual position is to the right of the brake pedal, and more often than not much too closely adjacent to the latter for safety. Some drivers habitually keep the right foot resting lightly on the brake pedal in towns, so as to be ready for any emergency, disengaging the accelerator pedal and controlling the engine speed entirely by the hand lever. The majority of drivers, however, prefer the contrary method, setting the throttle lever for slow running position and using the right foot indiscriminately for braking or speeding up the engine, enabling the foot to be rested flatly on the floor board in the intervals of free running. A tight squeeze, such as a child suddenly darting across a road, discloses the inadequate means of control, for in the hurry of doing something without deliberation or thought a mistake can easily be made,

The Hon. Mrs. Peel and her Humber Car at the gates of Cassiobury Park, Hertfordshire.

prevent one getting locked up for using strong language on the roadside. I am of the same opinion as your correspondent, as I find stiff tyres and strong language go together, as the former seem as if they will not go on at all until the latter is added to the work. I am pleased to think I can give your correspondent the information he requires. There is a detachable rim that is patented and being tested at the present time; it is to be known as the F. P., and only requires one minute to take off the tyre or to take out the tube and put in a new one of any make. He will be able to take off his rim and fix it again in three minutes, making a complete change in four minutes. I have seen it done and timed the man, so can speak from facts.—Yours truly,

R. FLINT.

SOME USEFUL ACCESSORIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 11th inst. I see that you state you will be glad to hear of any accessory which has been found of value in actual use. The pedal guard illustrated in the same issue is a case in point. I have used one of these on a "Baby Peugeot" for about a year, during which period I have driven in all weathers. The guard has enabled me to use an apron without any fear of it fouling the pedals. I have found it

the accelerator being depressed instead of the brake. On two occasions, when seated beside the driver, I have seen bad accidents only averted by the narrowest of narrow shaves owing to this very reason, and by making careful observation of the vagaries of quite a number of professional and amateur drivers I have become convinced that many otherwise inexplicable accidents are due to this very cause.

I venture to suggest, therefore, that to obviate trouble the accelerator pedal should be at the minimum distance of 4 in. to the right of the brake pedal. It would also be well to arrange the two pedals—the accelerator and brake—so that they work in opposite directions, one being pressed down and the other pushed forward, so as to render it a physical impossibility for a driver to make a mistake. Perhaps some of the readers of the *M.C.J.* will give their views on the subject.—Yours truly,

HARROGATE.

THE Automobile Association will be glad if the firm whose trade identification marks are F.M.F. will be good enough to communicate in confidence with the secretary, at Prince's Buildings, Coventry Street, London, W.

EASTERTIDE MOTOR RACING AT BROOKLANDS.—Dunlop tyres were fitted to more than half of the cars securing "places" in the events of the Brooklands Easter race meeting.

RACING AT BROOKLANDS.

THE cold, unseasonable weather which prevailed may have been largely responsible for the lack of public interest in the opening race meeting of the season on the Brooklands Track, Weybridge, which was held on Saturday last. So far as the officials were concerned everything was done to not only render the programme an attractive one, but to carry it through without any needless and tiring waits between the events. But, notwithstanding this, the number of spectators did not show any increase over those at last year's meetings. It would seem that, from the general public's point of view, something more will have to be done to induce them to swell the "gate." At present all that they can see is the parading of the favoured few in the paddock, the cars slowly running down the straight to the starting point, and, after a long wait, the cars dash along the fork at the back of the enclosure, and, finally, they sprint along the finishing straight to the winning post. Added interest in the proceedings would be given to the spectators if it could by any means be arranged for the starting line to be located nearer the enclosure than at present, as then they would be able to watch the operations of marshalling the competitors and furthermore of noting how they get into their stride. As it is many of the events are started almost out of sight, and it is only by the sounding of the bell that the public are made aware that the race has commenced.

The first event of the day was the Spring Stakes of 5 sovs. each, for cars propelled by means of internal combustion engines only, of a cylinder dimension 81 to under 91. Weight 2,500 lbs. Distance, about five miles. There were only three competitors, all driving 35.7 h.p. Berliets, the winner being Mr. D. Pigot, Mr. P. D. Stirling being second, and Mr. H. F. W. Farquharson third. The winner's speed was equal to sixty-two and a quarter miles per hour.

The second race was a novelty, inasmuch as it was confined to Sizaire-Naudin single-cylinder cars (120 mm. bore and stroke). The contest was over a distance of three miles, the Sizaire et Naudin cup being offered to the winner and a medal to the second. Ten entries had been received and of these nine faced the starter. Mr. J. F. Scantlebury led the way home and finished about ten yards in front of Mr. B. S. Millard, Mr. J. A. Schofield being third. An average speed of 39½ h.p. was attained by the winning car.

Event No. 3 was the third 26-h.p. race of 82½ sovs., for cars of a cylinder dimension 61 or under. Weight, 2,000 lbs. Distance, about 3 miles. Five competitors turned out, including two Napiers, a Germain, a Humber, and a De Dion. Newton on a chain-driven Napier was quickest away, but round the top banking Browning, also on a Napier, made a splendid effort to overtake him, the two coming down the finishing straight almost abreast. The result was F. Newton (Napier), 1; J. F. Browning (Napier), 2; J. W. Stocks (De Dion), 3; C. W. A. Brown (Humber), 4; and J. de Puelle de la Nippe (Germain), 5. The latter was put out of the contest by a broken valve tappet spring.

The next event was the Brooklands Cup, a handicap for private competitors, the entrant of the winner to receive the cup, and the entrant of the second a medal. For cars of a cylinder dimension 105 or under, to be entered and driven by private competitors of the Brooklands Automobile Racing Club. Distance, about five miles. There were eight starters, the result being: Mr. H. G. Nalder, 35.7 h.p. Berliet (1,051 yds. start), 1; Mr. G. Russell-Miller, 22.5 h.p. de la Baire (1,844 yds. start), 2; Mr. C. A. Bird, 34.5 h.p. Mercedes (scratch), 3. The winner went ahead on the completion of the first lap, and entered the finishing straight with a good lead.

There were only five competitors—two Napiers, a Daimler, an Iris and a Humber—in the third 40-h.p. race of £82 10s. for cars of a cylinder dimension 100 or under. Weight, 2,500 lbs. Distance, about 3½ miles. The Daimler retired early owing to ignition troubles, but the others kept close together until about the half distance. Newton on the Marquis de Mouzilly St. Mars' Napier, however, drew away and won by about two lengths; F. G. Cundy (Napier), being second; W. G. Tuck (Humber), third. A speed of 62½ miles an hour was attained by the winner.

The last race of the day was the second Surrey Stakes of 5 sovs. each, for cars of a cylinder dimension 95 to under 105. Weight, 300 lb.; distance, about three miles. There were only three competitors—two Napiers and an Iris—and for almost a lap the trio of cars ran almost bonnet to bonnet. The Napiers, however, pulled away, and entering the straight they ran practically side by side until just before the tape Draper (Napier) managed to forge ahead, and win by half a length. F. G. Cundy (Napier) was second and E. S. R. Thorne on Capt. G. Ll. Hinds Howell's Iris third.

On Easter Monday there was a better attendance than on the Saturday, and popular interest was evident in the first and last events, of the programme, viz., the Continental Stakes, in which Mr. O. Cupper's victory by about a length gave a tinge of excitement to the proceedings. Again, in the Tyre Change Plate the celerity of Mr. H. A. Bates in changing his tyre provided the spectators with the "something to see" that had been lacking. The first motor-cycle race on this track provided another novelty, but the riders were quickly scattered over the course, where they seemed somewhat lost. The fastest time of the day was made by Newton on the 90-h.p. Napier in a race which produced the only protest of the Easter meeting—a protest which, however, was unsustained. The contest for the Naval and Military Cup was run in a snowstorm, driving the public to shelter, and constituted an element of danger for the succeeding event. Punctually to the hour of three the

first race was run, this being the Continental Stakes over a five-mile course, starting from the railway side. Unfortunately Mr. Cory Hurford was a non-starter in this, the best race of the day. Mr. Oscar Cupper on his 48.2-h.p. Metallurgique made a splendid start and kept going well, F. Draper going in hot pursuit past the fork. The lead of the Metallurgique was maintained, and coming into the straight victory was secured at the rate of 78½ m.p.h., the win being extremely popular. Draper, who drove the 39.6 Napier of M. de St. Mars, was second, a length or so behind. E. G. Cundy (38.4-h.p. Napier) was third; F. R. Goodwin (43.4-h.p. Star) fourth; and Clement Hobson (48.6-h.p. Brasier) fifth.

The first Brooklands motor-cycle race was over a course of 5½ miles, and was won by W. Cook on Mr. A. G. Forster's 7.9-h.p. N.L.G. two-cylinder machine at a speed of 63 m.p.h. Quite half a mile separated him from the second, E. Kirkham, on a 7-h.p. Leader. C. R. Collier, 6-h.p. Matchless, was third, other competitors returning in the following order:—W. McMinnies, 3½-h.p. Triumph; W. H. Wells, 5-h.p. Vindec; M. Geiger, 6-h.p. N.S.U.; J. Slaughter, 3½-h.p. Triumph; J. C. Davis, 5½-h.p. Rex; E. Fitzherbert, 6-h.p. F.N.; F. W. Applebee, 5-h.p. Rex; H. Reed, 7-h.p. Dot; G. Adams, 6-h.p. Griffon; H. A. Collier, 3½-h.p. Matchless; H. A. Cooper, 3½-h.p. Triumph; H. Shanks, 2½-h.p. Chater; E. Gwynne, 5-h.p. Vindec; W. W. Genn, 7-h.p. Minerva.

The Naval and Military Cup was for cars owned and driven by commissioned officers on the active list. The weight was 2,800 lb. for vehicles of a cylinder dimension 100, and 3½ lbs. allowed or added for every 0.1 difference of dimension. A five-mile course was run, the winner being S. Gore Browne on Capt. S. C. Holland's 47.6-h.p. Gobron. His speed was 64½ miles per hour. J. Ballough (41.9-h.p. Districh) was second, 43.2.5 sec. behind the Gobron. G. C. Moss (27.2-h.p. Arrol-Johnston) had trouble with water in the petrol, and Sir G. Abercromby (58.1-h.p. Fiat), after running the leader close nearly the whole course, had to stop owing to the breaking of an ignition tappet.

As the Naval and Military Cup race had been run in a snowstorm, the track was damp for the next event, in which the skidding of the cars

The Brooklands Race Meeting.—Newton on the 90-h.p. Napier.

was very noticeable. This was the third 90-h.p. event over a 5½-mile course, and brought out a quartette of competitors, who finished in the order named:—F. Newton, on 90-h.p. Napier; Resta, on 76-h.p. Mercedes; F. Guy Lewin, on his 80.4-h.p. Hotchkiss; and E. de Wilton, on his 76-h.p. Mercedes. Resta, on his 76-h.p. Mercedes, got well away, but Newton steadily gained, and we had the enjoyment of a really keen contest. On the Byfleet banking Newton travelled at a great pace, and, taking a wide sweep, seemed likely to pass the Mercedes, but his car appeared to slide down the banking and touch the rival vehicle. Expert handling of the steering wheel got the cars clear, and he came along the straight 100 yards ahead. On examination in the paddock, the spokes of both the wire wheels on the left-hand side of the Napier were seen to have been cut and bent, while on the right hand side of the Mercedes the metal of the front wheel hub cap was torn away as well as several of the hub plate bolts. Resta lodged a protest on the ground of a foul, but the stewards overruled it on the ground that such must be either wilful or negligent.

The Private Sweepstakes, arranged as a handicap, brought out a quartette of competitors, the winner attaining a speed of 70½ m.p.h. In the result, Clement Hobson, who started from scratch on his 48.6-h.p. Brasier, won by 100 yards, the other competitors being A. Van Hoboken, 48.6-h.p. Mercedes, 600 yards start, who finished second, followed by Sir George Abercromby's 58.1-h.p. Fiat, which was on scratch, and F. N. Lloyd's 20.1-h.p. Clement-Talbot, which had 1½ miles start.

The concluding event of the meeting was the Tyre Changing Plate, in which, at a specified place during the race, the complete tyre of the right hand back wheel had to be replaced by the spare tyre carried; this had to be duly fixed and inflated by hand pumping. F. Newton, on the 25.6-h.p. Napier, was the first to reach the changing station, the driver of the 25.6-h.p. De Dion being second. H. A. Bates and E. Anthony, on 22.5-h.p. Fords, were third and fourth, and both got away before the De Dion, the ultimate order of the finish being: 1, Newton; 2, Bates; 3, Anthony.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE next meeting for the consideration of the applications of candidates for membership of the club will be held on the 6th prox. The club has now 3,424 members, not including associates enrolled under the new scheme. The number of associates elected up to the present is 225.

Examinations have been held during the past two weeks at Southport, Plymouth, and Colchester. Examinations will be held at the Naval Motor School, Portsmouth, on April 24th; Royal Hotel, Plymouth, on May 2nd; and Spa Hotel, Tunbridge Wells, on May 16th.

The Kent Automobile Club is presenting a gold medal to the candidate who obtains the highest relative number of marks for mechanical knowledge at the examination on May 16th, and as this examination is open to owners of cars in addition to professional drivers, a large entry is anticipated.

MOTOR UNION.

A MEETING of the Committee of Medical Motorists which has been appointed by the Motor Union to protect the interests of the general body of medical men using motor-cars was held at 1, Albemarle Street, London, on the 15th inst. Dr. C. B. Lockwood, F.R.C.S., was elected chairman of the committee, and Dr. J. L. Lock, M.A., M.B., vice-chairman.

The question of the position of doctors in reference to the proposed taxation of motor-cars was considered, and it was resolved that a letter be sent to the Chancellor of the Exchequer embodying the following resolution:—"That in the opinion of medical motorists any additional

We illustrate above a smart little 6-h.p. Rover just turned out by the Rover Company to a special order.

It will be noticed that the body closely follows the well-known lines of the Continental racing cars, and is somewhat after the type used in the small cars in the French Voiturette Race of last year. Anticipating a demand for this type of small car, the Rover Company propose shortly to standardise it.

taxation upon motor cars would not be equitable and would press with special severity upon medical men who use motor vehicles to enable them to carry out their professional duties."

The new tariff of the Metropolitan Water Board for water for washing cars was considered, and it was resolved that the proposed charge of 20s. per car per annum was excessive and unfair as compared with the rate for water for horse carriages, and it was resolved to approach the Board upon the matter.

The Finance Committee of the Motor Union, in their monthly report to the General Committee, state that the receipts from January 1st to March 31st amounted to £6,151 3s. 1d., as compared with £4,248 14s. 5d. for the corresponding three months of 1907.

THE MOTOR UNION AND SCOTTISH A.C.

CORRESPONDENCE has passed between Mr. W. Rees Jeffreys, secretary of the Motor Union, and Mr. R. J. Smith, secretary of the Scottish A.C., relative to the recognition of hotels and repairers north of the Tweed. In the first letter Mr. Smith drew attention to the fact that the Motor Union were communicating with hotels on the official list of the Scottish A.C., and went on to say that his committee "would be sorry to have to put themselves into communication with those holding the Club's official appointment and to have to recall the existing certificate, but the committee instruct me to state that, unless your circular is immediately withdrawn, they will have no alternative but to take action in the matter at once." Mr. Rees Jeffreys replied that "The Motor Union could not obviously again place itself in a position by which it could be peremptorily deprived of its local correspondents, its local solicitors, its local repairers and hotels, by the action of a body over which it had no control. Direct

official appointments by the Motor Union have become necessary, but there is no reason why the Motor Union appointments should not run side by side with those of the Scottish A.C. My committee are anxious to co-operate with your Club, both to exchange information and to reciprocate benefits. Your committee will, however, recognise that the interests of its Scottish members, as well as of those motorists from England, Wales, and the United States, who tour in Scotland during the season under the aegis of the Motor Union, demand that it should have an organisation which is under its direct control."

The final letter is from Mr. R. J. Smith, whose committee "regret your intimation that the Motor Union is unable to discontinue the appointment of official hotels and repairers in Scotland. My executive have instructed the recall of the existing certificate. They cannot see how, after your action, your committee could expect these certificates to be exhibited alongside those to be issued by the Motor Union, and consequently are unable to see how their recall and replacement by others from which the Motor Union name is omitted can, as you suggest, be interpreted as an act of open hostility to the Motor Union. They would respectfully suggest that the Motor Union have opened hostilities."

WOLVERHAMPTON.

THE Wolverhampton A.C. have commenced their season's out-door work with the customary meet in the West Park. This year the official return of the members to the road was made under favourable conditions and between sixty and seventy cars of all sorts and conditions were assembled. The gathering was particularly interesting in view of the contrast it afforded between some modern examples of the motor-vehicle and one of the earliest products of the industry. This car was one of the little Mabley's, seating two persons, and running about on three wheels.

Those who attended the meet included Messrs. T. A. Stirk, 10-12-h.p. Sunbeam; F. F. Sharp, 16-20-h.p. Sunbeam; T. T. Mills, 18-h.p. Daimler; Walter E. Evans, six-cylinder Napier; S. Bayliss, 20-h.p. Sunbeam; T. Cureton, 16-20-h.p. Sunbeam; J. Dyke (Willenhall), 10-12-h.p. Sunbeam; G. Evans, 30-h.p. Austin; J. W. Davis, 28-36-h.p. Daimler; E. Genna, 20-h.p. Sunbeam; J. H. Jones, 16-20-h.p. Sunbeam; F. Eastmead, 20-h.p. Sunbeam; E. Lisle, 16-h.p. Star; Joseph Evans, 28-36-h.p. Daimler; C. H. Shacklock, 20-h.p. Aster; Leigh, 20-h.p. Turner; F. Gibbons, 20-h.p. Minerva; Eason, 10-12-h.p. Starling; Dickinson, 9-11-h.p. Talbot; Truselle, 9-11-h.p. Talbot; S. R. Rhodes, 12-h.p. Star; J. Lisle, six-cylinder Star; Holman, 12 h.p. Star; Shaw, 10-h.p. Starling; Dr. Scott, 14-h.p. Star; William Evans, 11-24-h.p. Austin; F. Carr, 14-h.p. Sunbeam; Major Haden, 14-h.p. Sunbeam; A. S. Weaver, 16-20-h.p. Sunbeam; Brownhill, Mabley car; Lee, 20-h.p. Lanchester; Clark and Sons, 12-14-h.p. Adams and 10-h.p. Adams; Dr. Hunt, 14-16-h.p. Argyll; G. W. Hands, 16-20-h.p. Calthorpe. The Star Engineering Company were also represented by a 7-h.p. Star, 14-h.p. Star, two 12-h.p. Stars, 30-h.p. Star, 20-h.p. Star, 10-h.p. Royal Starling, and 9-h.p. Star landaulet, and the Sunbeam Motor Company had a 20-h.p. Sunbeam, two 16-20-h.p. Sunbeams, a 20 h.p. Sunbeam limousine, and a 20-h.p. Sunbeam landaulet.

NEWCASTLE MOTOR CLUB.

AN extraordinary meeting of the Newcastle Motor Club has been held at the Royal Oak Hotel, Newcastle, under the presidency of Mr. W. Dunn. Mr. J. E. Hodgkin (secretary of the North-Eastern A.A.), intimated that in a private interview with Mr. F. Straight (secretary of the A.C.U.), he advocated the formation of a northern centre of the A.C.U., and mentioned that, as the N.E.A.A. embraced the majority of northern motor-cyclists in their membership, they were in a strong position to take the initiative in the movement. It was decided to affiliate with the North-Eastern Automobile Association, and request that body to appeal to the A.C.U. to form a northern centre to govern all competitions and other matters on the lines suggested by Mr. Hodgkin.

YORKSHIRE.

THE speed trials of the Yorkshire A.C. will be held on the Sands between Saltburn and Marske, on June 27th, with Mr. C. P. Wilson, of Basinghall Buildings, Basinghall Street, Leeds, as secretary of the meeting. Entries will be received by him up to 12 noon on June 17th. The R.A.C. formula will be used in the classification and eleven events will be open only to members of the Yorkshire A.C. and its affiliated branches. The open contests will be for touring cars carrying four passengers, the chassis price of which does not exceed £800, for racing cars not exceeding in weight 1,000 kilograms, and for racing cars of any weight.

MANCHESTER.

THE Manchester A.C. held their second run of the season at Bamford, in Derbyshire. About thirty cars foregathered at the Marquis of Granby Hotel for afternoon tea, having made the journey either via the Snake or Chapel-en-le-Frith or Buxton and Tideswell.

An interesting competition was improvised at Bamford for the encouragement of chauffeurs. Without any previous notice the engines were inspected for general condition and cleanliness. Messrs. A. E. Jonas, A. E. Crowdy, and D. A. Parkyn officiated as judges, and unanimously awarded the first prize to Mrs. D. W. W. Parry's chauffeur.

whose Renault engine was excellently kept. The second prize was obtained by Mr. V. F. O'Neill's chauffeur, whose Berliet engine was also in fine condition.

BROOKLANDS.

At the next race meeting, to be held on the 9th prox., the events will include 26-h.p., 40-h.p., 60-h.p. and 90-h.p. races, a motor-cycle handicap, a touring race over an 8½ miles course, a handicap for private competitors, a limit sweepstakes for cars not to exceed 60 m.p.h. during the race, and a private competitors' sweepstakes. Entries will close on May 1st.

LINCOLNSHIRE MOTOR-CYCLE.

The Lincolnshire Motor Cycle Club are to be congratulated on the success of their hill climb at Waddington on Monday. There were sixty-seven entries and some splendid runs in each of the four classes.

Dr. Lowe won the 2½-h.p. class with his 2½-h.p. Ariel. Mr. A. E. Brunning, Lincoln, 3½-h.p. Fafair, won the 4-h.p. class. The twin cylinder class fell to Mr. W. G. Clark, Louth, 5-h.p. Rex, who made far the best time of the day. Mr. Eric Longden, 7-9-h.p. Minerva, won the passenger class.

SOCIETY OF MOTOR MANUFACTURERS AND TRADERS.

The sixth annual general meeting of the Society of Motor Manufacturers and Traders was held on the 15th inst. at Maxwell House, Arundel Street, London. Mr. E. Manville presided. The report and accounts were adopted, and a vote of thanks accorded to the secretary, Mr. T. Woodfine, the exhibition manager, Mr. H. A. Blackie, and to the other officers of the society.

The following were declared elected to the new council:—Ordinary members: Messrs. E. M. C. Instone, J. D. Siddeley, C. Jarrott, E. Powell, S. F. Edge, E. Gascoigne, F. Lanchester, H. G. Barford, C. Johnson, T. H. Woollen, A. Brown, H. Austin, Harry Smith, J. E. Hutton, R. Dennis, S. Straker, W. G. Williams, G. du Cros, P. Richardson, H. du Cros, jun., E. Lisle, H. Sturmev, T. Clarkson, W. M. Letts, H. Johnson, F. Coleman, H. J. Swindley, H. J. M. yses, and F. R. Simms. Associate members: Messrs. A. R. Atkey, G. Prosser, G. Mann, W. Parker Thomas, A. Farnell, A. C. Hills, H. Carver, Major F. Lindsay Lloyd, H. J. Lloyd, and H. G. Atkinson.

A vote of thanks to the president for his services to the society during his twelve months of office was accorded.

ROADS IMPROVEMENT ASSOCIATION.

The annual report of the Roads Improvement Association for 1907 has been issued. Its main features are well known to our readers. The expenditure in connection with the tar spreading competitions was £855 5s., and the receipts therefrom £851 14s. 2d.

SCOTTISH.

In connection with their sign-posting scheme the Scottish A.C. are having a post bearing the club badge and the word "Scotland" erected on the boundary between Scotland and England on each of the main roads leading from the south, thus intimating to the drivers from the south that they have passed into Scottish territory and giving the distances to various places further north.

WELSH.

PREPARATIONS are being made for this year's trials. The hill-climbing competition will probably take place on June 4th at Philadelphia Hill, between Carmarthen and Porthrhyd. There will be competitions for both cars and motor-cycles, and the club also intend having a two days' trial for cars over a route from Swansea to Haverfordwest, St. David's, up Fishguard Hill to Brecon and Aberystwith. At the last named place the competitors will stay the night, and the return journey next day will probably be via Llangerrig, Builth, and Brecon.

TRACK RECORDS.

ON the 15th inst. Mr. F. Newton, driving a 90-h.p. Napier, succeeded in lowering the 90-h.p. standard "short" record for the Brooklands track, lately created by Mr. D. Resta. Mr. Newton had intended to endeavour to create new speeds for the flying half-mile and the ten laps—the short and long standard distances. His first three laps were made at speeds of slightly over 71, 78, and 83 miles per hour. After the first three laps had been completed the Napier greatly quickened its speed, and lap after lap was completed at speeds varying from 92 to 97 miles an hour. After completing the ten laps Mr. E. de Kodakowski, the clerk of the course, pronounced that Mr. Newton had failed to lower the "long" ten-lap record of over 89 miles per hour made by Mr. Resta on his Mercedes the previous Friday, but that Mr. Newton had created a new one for the "short" half-mile sprint, with a flying start.

The official rate of speed for the half-mile was at the rate of 102.85 miles an hour, the time being 17½ seconds. The Napier accomplished an average speed of over 88 miles per hour for the ten laps. The Dunlop tyres stood up well and showed no signs of wear. They were pumped up only to 70 lb. pressure per square inch for the front tyres and 75 lb. pressure for the back driving wheels.

CASES UNDER THE MOTOR CAR ACT.

NO LIGHT.

At the Clontarf Police Court, several motor-cyclists as well as drivers of motor-cars have lately been fined for having no lights on their vehicles. There seems to have been quite an epidemic in such cases around Dublin lately.

EXCEEDING LEGAL LIMIT.

At the Grantham (Spittlegate), Police Court, four motorists have been fined amounts varying from £2 to £5 for driving motor-cars at an excessive speed on the Great North Road.

Eight motorists were fined sums ranging from £1 to £10 and costs at the Chichester County Bench on Saturday. Most of the alleged offences took place on the Chichester and Arundel road at Westhampnett.

On the 15th inst. four motorists were fined £3 each at Kingston for exceeding the legal limit; two others were similarly fined for identical offences at Barnet, and four convictions were recorded at the Wimbledon Petty Sessions.

AN APPEAL AND AN ARRANGEMENT.

At the Surrey Quarter Sessions Mr. Ernest Hargreaves, of Kensington, appealed against a conviction by the justices of the Kingston Division, who fined him £10 and suspended his licence for three months for driving to the danger of the public on February 2nd. Mr. R. O. B. Lane appeared for the justices and Mr. G. Elliott and Mr. Walter Pain represented the appellant. Mr. Lane opened the case and said it was a very bad one, and was exceptional in character from the fact that it was not a police prosecution, but was instituted on the information of independent gentlemen of good standing. Mr. Hans Hamilton, of Claygate was called to give evidence, and had just commenced when a

A New Use for the Stepnay Spare Wheel.

It has remained for Mr. E. E. C. Mathis, the leading motor-car agent of Strasbourg, Alsace, to discover a new use for the Stepnay spare wheel. When new chassis, minus tyres, arrive at the station, instead of mounting them on horse-drawn trolleys, Mr. Mathis fits Stepnay spare wheels to the road wheels and drives them to his depot.

consultation took place between counsel, as the result of which Mr. Lans said after a careful consideration of the facts he had come to the conclusion that the justice of the case would be met by a reduction of the fine to £5, and the removal of the suspension of the licence, the appellant to pay a fixed sum for costs which had been agreed upon. Mr. Elliott, on behalf of the appellant, agreed to this course. After a long consultation with his colleagues, the Chairman said it was unfortunate that the case could not be heard properly because of the absence of an important witness, and under the circumstances the court would allow the arrangement that had been come to.

THE USE OF THE TRADER'S MARK.

At the Woking Police Court Mr. A. Humphreys, of the Falcon Motor Garage, Falcon Road, Guildford, pleaded not guilty to having driven an unregistered car.—Mr. W. Triggs Turner defended.—Supt. Marks said that on March 21st defendant called at Woking Police Station to inquire the whereabouts of a stranded car. Witness obtained the information by telephone, and then noticed that defendant was driving a car which bore a manufacturer's identification mark, P 1 A G. Defendant said he was going to see the car at Ottershaw, with a view to having it removed to his works. Witness asked him whose car he was driving, and he said it had been sent down from London for repair. Witness pointed out that as the car was not on trial it should have been registered. Defendant said he had removed the owner's plates, and substituted his own mark. Mr. Turner said his client was a dealer, and paid an annual fee entitling him to use a general identification mark for any car on trial after completion, or being tried by an intending purchaser. He had arranged to take this car to another dealer, Mr. Smith, London Road, Camberley, to be tried by a prospective customer, and before starting out received instructions from a Mrs. Peters to remove her husband's stranded car from Ottershaw to Guildford. Instead, therefore

of going direct to Camberley, he went first to Ottershaw to arrange for the removal of the broken-down car, and from there to his destination, where he gave the trial. Mr. Turner contended that his client was not compelled to go to Camberley the shortest way, and that he was entitled to use the car as he did without its being registered. The Bench found defendant guilty of having used an unregistered car for the purposes of his business, and a fine of 10s. was imposed, defendant's licence being endorsed.

AUTOMOBILE ACCIDENTS.

A SERIOUS motor-car accident occurred at Shepperton-on-Thames on Saturday night, in which a motor-car belonging to Mr. C. E. Howard, of Twickenham, was much damaged, and the occupants, five gentlemen, were seriously injured, and narrowly escaped losing their lives. Mr. Howard had taken four friends on his 30-h.p. Renault to play golf at Sunningdale. They were returning to Twickenham in the early evening when, as they were passing through Shepperton, and nearing the cross roads there, Mr. Howard slowed down to four or five miles an hour, and constantly sounded his horn. Just as he was passing the cross roads the 40-h.p. Iris car which had taken part in the races at Brooklands was seen approaching at right angles. Mr. Howard applied his brakes, and brought his car to a stand in a few yards. The other car swerved to the side to avoid a collision, and the front of it passed the stationary car, but the rear part collided with it with great force, dragged it round, and then turned it completely over, throwing the five occupants into the road, inflicting severe injuries and rendering two of them unconscious. Save for the loss of a rear wheel the Iris car was not much damaged.

At the inquest at Reading on Saturday on Mr. R. C. Guille, who was killed in a motor-car collision in Reading while cycling, the jury

Mr. Elwood Haynes, of Kokomo, Ind., U.S.A., on the Car he built in 1893, preparing for the recent Carnival in New York.

This 15-year-old car has reposed in the Smithsonian Institute at Washington, U.S.A., for some years, and was loaned by the officials for the carnival, when, after a little tuning up, it ran to such effect that Mr. Haynes was stopped by the police for exceeding the legal limit and running a car without a number plate.

found a verdict of "Accidental death." They added a rider, however, stating that they considered that the motor-car was travelling at too great a speed, and recommended the Town Council to secure the limitation of the speed of motor-cars in the borough to six miles per hour.

SEVERAL motor mishaps occurred in Croydon on Monday, and during the day three persons injured by motor vehicles were conveyed to the hospital.

AN inquest has been held at Hammersmith concerning the death of a traveller's agent named Edward James, who was knocked down by a motor-car in Sheen Lane, Barnes. A man who witnessed the accident said the car was travelling at the rate of twenty miles an hour. Thomas Yapp, a cabman, said he saw James hesitate as he crossed the road. He went forward again, and was then struck by the front of the car. If he had gone straight across the road in the first instance the accident would not have occurred. A constable stated that after the accident he had to protect the chauffeur from the hostility of the crowd. The chauffeur said he was coming down Sheen Lane at not more than ten miles an hour. James walked off the kerb, right in the front of the car. The brakes were immediately applied, and the witness did all he could for the man afterwards. The jury returned a verdict of "Accidental death," exonerating the chauffeur from blame.

A SERIOUS motor accident, resulting in the death of one man and injuries to another two and a woman, occurred in Oxford Street, London, about two a.m. on the morning of Friday of last week. At that time a water van was watering the south side of Oxford Street when it was overtaken at the corner of North Audley Street by a motor-car, which skidded, with the result that the two vehicles came into violent collision. The chauffeur, named Grosvenor, was killed, the driver of the water-van was severely injured, and the passengers, a lady and gentleman, were taken to the Middlesex Hospital for medical treatment.

An inquest concerning the death of the chauffeur was held on Tuesday when J. Hostelle, an interpreter, and his wife, who were in the car, gave evidence as to the unexceptional pace of the vehicle. The driver of the water cart said that the car came upon him suddenly. The owner said the deceased had full authority to take the car out, and after summing up by the coroner, who referred to the growing number of motor-car accidents in London, the jury returned a verdict of "Accidental death." They asked the Coroner to frame a rider drawing the attention of the authorities to the excessive speed in general of motor-cars in London.

MOTOR-CYCLING.

FAVoured with fine weather, the motor-cycle race meeting on the Canning Town track on Good Friday attracted about 3,000 spectators. The most interesting event was the five miles race for touring machines with 26 in. wheels, engines not exceeding 90 by 90, or the equivalent, and geared at not more than 4 to 1. F. E. Barker, 2½-h.p. Rex, got off well, and, leading throughout, won very narrowly in 7 min. 4-5 sec. H. A. Collier, 3½-h.p. Matchless, was second, and H. V. Colver, 3½-h.p. Matchless, a good third. C. R. Collier and H. V. Colver were matched together in races over one and three miles, and they also engaged in a five miles pursuit race.

In the mile race, Collier won rather easily in 1 min. 27-4-5 sec. The three miles race was far more evenly contested. The two competitors kept well together for the whole distance, and Colver eventually finished 3 sec. ahead, in 3 min. 42-2-5 sec. There was very little difference between them in the pursuit race, Collier finishing only 1-1-5 sec. in front of Colver, in 6 min. 4-1-5 sec. The other events resulted as follows:—

Five Miles Handicap (engines not exceeding 76 by 76, or equivalent).—Heat 1: D. R. Clarke, New Century (10 sec. start), 1; C. R. Collier, Matchless (scratch), 2. Heat 2: H. V. Colver, Matchless (5 sec.), 1; C. E. Bennett, Mansfield (scratch), 2. Final: H. V. Colver (5 sec.), 1; C. R. Collier (scratch), 2; C. E. Bennett (scratch), 3. Time, 5 min. 52-2-5 sec.

Five Miles Scratch Race (engines not exceeding 76 by 76, or equivalent).—Heat 1: C. R. Collier, Matchless, 1; D. R. Clarke, New Century, 2. Heat 2: H. V. Colver, Matchless, 1; C. E. Bennett, Mansfield, 2. Final: C. E. Bennett, 1; C. R. Collier, 2; H. V. Colver, 3. Time, 5 min. 55-1-5 sec.

H. V. Colver made an attempt on the ten miles' world's record, but he was outside record time, and finished in 11 min. 55-3-5 sec., this being 31 sec. slower than the record for ten miles.

ROAD REPORTS.

EAST MOLESEY.—The Highway Committee of the East Molesey District Council have reported that they had been asked by the Hurst Park Syndicate, Limited, whether they would be prepared to cover the road from Hampton Court Bridge to the members' carriage entrance with some dust-preventing compound, providing the company paid half the cost of same, during the summer months. After going carefully into the matter they recommended the Council to experiment on the road in question with the preparation of the Hahnite (1907), Limited, for one season, providing the Hurst Park Club Syndicate will pay two-thirds of the estimated cost, viz., £80. This course has been approved.

WANDSWORTH AND PUTNEY.—The Wandsworth Borough Council has resolved to tar spray the carriageways of Kingston Road, Putney Embankment, Disraeli Road, part of Oxford Road, between Disraeli Road and Upper Richmond Road, Putney, and Huguenot Place, Wandsworth, at an estimated cost of £200.

HORSHAM.—At the annual meeting of the Horsham Rural Council just held the following resolution was adopted:—"That, in view of the great and increasing danger to the public, and the unbearable nuisance of the dust arising from motor-cars, this Council again urges the West Sussex County Council to take immediate steps to restrict the speed of all motor-cars to eight miles an hour when passing through the villages of Roffey, Broadbridge Heath, and Southwater."

WOKING.—All the roads in the vicinity of Woking are being carefully watched, and Superintendent Marks is directing the operations of the police. "Controls" have been established at Sandhurst Bridge, Ripley, and Burnt Common, all leading to the Woking Police Court.

INTERNATIONAL TOURING CAR TRIAL.

It has been decided that the routes for this trial shall not be published until just before the beginning of the event. The stopping places each night, however, will be issued shortly. Entries at double-fees will be received up to 12 o'clock noon on Tuesday, April 21st, and on that day the entry list will be finally closed.

The committee has asked for drawings of the competing cars to be submitted for inspection, and these are required by May 1st.

In the report presented at the annual meeting on Wednesday, the directors of Messrs. A. W. Gamage, Ltd. referred to the increased factory, workshop and garage accommodation that is being made in connection with the re-building of some of the premises adjoining their Holborn headquarters.

AN INSURANCE POINT.

IN the Court of Session (Scotland) Lord Guthrie has issued a judgment in an action concerning the insurance of motor-cars. The case was raised by A. Donaldson and Co., Ltd., Edinburgh, against the Horse Carriage and General Insurance Co., Ltd., with whom the pursuers were insured. Only one of five claims, amounting to £38 8s., was dealt with in the present judgment.

On October 21st, 1906, while a 16-h.p. Albion car belonging to the pursuers was being driven from Ayr to Edinburgh the driving chain broke and the car was upset. The cost of the repairs (£38 8s.) was not disputed, but it was maintained by the defenders, in the first place, that the claim was excluded on a sound construction of the policy of insurance. In the second place, they maintained they were not liable in the case of motors for any mishap to the motor (however accidental in the sense of being involuntary on the part of the driver and owner, and independent of the condition of the motor), unless the accident happened through collision, or being run into.

Lord Guthrie found that the accident was not due to any of the excepted clauses enumerated in the policy of insurance, and, consequently, that the defenders were liable to the pursuers in the cost of the necessary repairs to the car, which he assessed at £38 8s. With the finding the cause was put to the roll for further procedure, and the question of expenses was reserved. His Lordship pointed out that it was not without difficulty that he held the pursuers' claim to be within the contract. With regard to the defenders' second contention, he was of opinion that there was no presumption in favour of such limitation of liability as was contended.

THE PERFECT CHAUFFEUR.

WHO is the Perfect Chauffeur, who is he
That every motor man should wish to be?
Tis he whose law is reason, who depends
Upon that law as on the best of friends.
'Tis he who wisely regulates his speed,
"The road for all" the first words of his creed.
'Tis he who feels it is not sport or just
To smother others in a cloud of dust,
But when a straight, clear road before him lies,
Open his throttle and along he flies,
Through peopled places goes a sober pace
And drives with courtesy in every case.
This, his plain duty, yet when this is done
His serious work is just begun.
A chauffeur needs must be a man of parts,
Versed in bucolic and domestic arts;
Cows he must know to drive, and flocks of sheep,
Carters awaken from their slumbers deep,
Horses convince what folly 'tis to shy,
Chickens restrain from 'neath motor wheels to fly.
Be to each goose philosopher and guide,
Prevent dull dogs committing suicide;
Make yokels comprehend the rule of road—
That left is right—so runs our British code.
To daring schoolboys, babes that stray alone,
Needs give the care that he would give his own.
With him it rests to make the deaf man hear,
Albeit deafen not the churchman's ear!

Impress on all this truth profound and deep,
The public road is not the place to sleep!
So he drives alert throughout the day—
This is the Perfect Chauffeur, this is he,
That every motor man should strive to be!

CHAS. W. FURRER in "Automobile Topics."

CLAIM AGAINST MOTORIST.

BEFORE Sir William Selfe, at the Marylebone Court, Edward Newman sued Mr. Louis Sinclair, ex-M.P., to recover £10 in respect of damage done to a bicycle. Mr. Sinclair had paid £1 18s. into court as being an adequate sum to cover the damage done. The plaintiff's case was that he was cycling out of Maida Vale into Belsize Road when Mr. Sinclair in his motor-car turned the corner, and when on his wrong side of the road came into collision with the bicycle, which was practically ruined. Mr. Sinclair, on the other hand, stated in evidence that a number of cyclists were riding in front of him on their wrong side of the road, and the defendant seemed to "wobble" as if he were uncertain which way to go, and then his bicycle struck the motor-car, which, at the moment of the accident, was stationary. His Honour gave judgment for the plaintiff for £2 12s. 6d., less the £1 18s. paid into court.

ONE of the specialties marketed by Messrs. G. T. Riches and Co., of Store Street, London, W.C., is the "Rich" detachable air tube, for motor-cycles, tri-cars, &c. A great saving in time, trouble, and expense is effected by using these tubes in that a tube can be replaced without unscrewing a single nut on the machine in less than five minutes.

COMPANY NEWS.

HEAD NON-SKID TYRE COMPANY.—£5,000. Agreement with Mr P. H. Head. Cannon Street Buildings, 139, Cannon Street, E.C.

RESILIENT TYRES.—£60,000. Minimum subscription, 10,000 shares. First directors, Messrs. C. Roberts (chairman of London and South Coast Motor Service, Ltd.), L. Rolfe, E. T. Holloway, and F. W. Carpenter. 11, Ironmonger Lane, E.C.

MOTOR CAB COMPANY OF GREAT BRITAIN, LTD.—March 26th. £50,000 (£1). As title. Minimum subscription, 100 shares. First directors (not less than three nor more than seven) to be appointed by signatories. 100 shares. As fixed by company. Offices, 14, Regent Street, London, S.W.

DUNLOP PNEUMATIC TYRE.—For the six months ended March 31st the directors propose interim dividends at the rates of 8 per cent. per annum on the ordinary shares, and 5 per cent. per annum on the deferred shares.

MOTOR REPLACEMENTS AND REPAIRS.

IN Frederick's Row, 326A, Goswell Road, London, E.C., is the engineering works of the B.K. Manufacturing Company—the ground floor of which is well equipped with the latest machines. The company make a speciality of re-boring cylinders and fitting new pistons and rings, their set of piston patterns including all the well-known makes of engines. Gear work is another department by which they are able to be of service to motorists who wish to replace parts without delay. With the aid of modern plant and an efficient staff, the B.K. Manu-

F. EBLE. HENRY. HANRIOT.
The Drivers of the Benz Cars in the A.C.F. Grand Prix Race.

facturing Company is able to undertake the supply of every type of motor replacement parts, thus facilitating the work of repairers not so favourably situated.

MOTORING IN MALAY.

SHORTLY after the purchase of the Daimler 30-h.p. car, Mr. Tan Tat Yan, of Malacca, determined to undertake a run from Malacca to Penang, which, in view of various difficulties, few people thought could be accomplished. But so resolute was he that even when, on the eve of the undertaking, he received a wire from a European friend in Kuala Lumpur couched in the following discouraging terms:—"Road from Tanjong Malim to Slim under repair, impossible for car to go over," he coolly said, "Now or never," and a start was made on the morning of February 22nd last. The roads up to Palau Sebang greatly impeded the car, but eventually the motorists reached Kuala Lumpur, where the night was spent. A start was made early the next afternoon, and although the road here was certainly very good, it was so hilly that nothing beyond eighteen miles could be covered in an hour. Though still alive to the fact contained in the above-mentioned telegram, the foolhardy tourists dashed on, only to realise the fact, and to consequently trace their way back to the last halting place, where they were obliged to stay the night. The next day the tourists and their car were railed to Slim, whence they motored to Ipoh in four hours. Leaving this place early the next morning, they reached Perak River in one hour and twenty minutes, crossed over the long pontoon bridge, passed Kampar, ferried across the Krian River, and without further difficulty reached Penang, where they were met with a hearty welcome at the hands of the members of the Chinese Club.

FORTHCOMING EVENTS.

APRIL.

- 25th (Sat.).—Open Motor-Cycle Hill Climb of the Hertfordshire C.A.C. Opening meet of the Yorkshire A.C. at the Hotel Majestic, Harrogate.
 25th (Sat.) to May 25th.—Industrial Vehicle competition of A.C.F.
 26th (Sun.).—Southend M.C. run to Thatched House Hotel, Kpping.
 29th (Wed.).—Quarterly trial of the A.C.U.

MAY.

- 2nd (Sat.).—Impromptu pace judging competition of the Sheffield A.C. at Ollerton.
 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
 10th (Sun.).—Targa Florio Race.
 14th (Th.).—Mr. G. H. Baillie at the R.A.C. on Petrol and Petrol Tests.
 16th (Sat.).—Fifty miles Consumption Trial of the Hertfordshire C.A.C. Liverpool A.C.'s opening meet of the season.
 21st (Th.).—Reliability Trial of the Irish A.C.
 23rd (Sat.).—Clipstone race meeting of the Notts A.C. Meeting of the Yorkshire A.C. at Helmsley. Meet of the Motor Union at Lincoln.
 25th (M.).—Industrial Vehicle Competition of the A.C. de France.
 26th (Tu.).—Motor Gymkhana on the links of the Ross Golf Club at Alton Court—Mr. T. H. Coombes, "Montrose," Ross, is the hon. secretary of the event.
 28th (Th.).—Visit of the Aero Club to Aldershot.
 30th (Sat.).—Meet of the Herts C.A.C. at Hatfield Park.
 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.

JUNE.

- International Aeronautical Federation conference in London.
 5th-6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
 Start of the International Touring Car Trial of the R.A.C.
 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
 17th.—Close of Prince Henry Touring Competition in Germany.
 13th (Sat.).—Hill climb of the Notts A.C. at Oakmoor.
 Speed Trials of the Lincs. A.C. at Grimsthorpe.
 15th-19th.—Scottish Reliability Trial.
 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
 27th (Sat.).—Saltburn beach races.
 Buxton meet of the Manchester and Lincolnshire clubs.
 Members of the Cheshire A.C. will participate in the Gymkhana of the Manchester A.C.
 28th. (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
 6th (M.).—Grand Prix A.C.F. (Voiturette section).
 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
 11th (S.).—Provincial meet of the R.A.C. at Hereford.
 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
 18th (Sat.).—Annual Gymkhana of the Herts C.A.C. at The Grove, Watford, by permission of the president, the Earl of Clarendon.
 Meet of the Liverpool and Cheshire A.C.'s at Delamere.
 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club. Annual Open Hill Climb of the Midland A.C. at Shelsley Walsh.
 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

AUGUST.

- 29th (Sat.).—Meet of the Lincolnshire Motor Club at Lincoln.
 30th (Sun.).—Southend M.C. run to Great White Horse Hotel, Ipswich.

SEPTEMBER.

- 5th (Sat.).—Aston Hill climb of the Herts C.A.A. Provincial meet of the R.A.C. at Norwich.
 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

Secretaries of automobile clubs are invited to forward their programme of fixtures as soon as arranged.

ENGLISH AS IT IS WRITTEN.

THE following is a copy of a letter lately received by a firm of motor-car builders from a provincial motor-car repairer:—"I was at your Place last Novemb about a mout wich I have of you mak. I have don what you told me but it will mot go the plug is all Right I think it dont make the gas it dont seem to go to the top do you think the Ring is Right. I got them out but thay look all Right I shaud be glad of a Book of the Moter it is aut of mote Boat I have fixed it in my Shop to drive a Lathe but it will not go I lost no end time trying to go I shoud be Gad to now the cause of it if you think it the Ring I should be Gad of New one if you send me book I may find something out. I have fitte white mettle in Bering but it Just the same P let me now by Return of Post."

BUSINESS NEWS.

THE Star cars of the Star Engineering Company are being introduced into Holland by the N.V. Auto-Rijtuig-Onderneming of Rotterdam.

MESSRS. ASHWORTH AND WILSON, of 265, Deansgate, Manchester, have altered their telegraphic address from Berliet to "Ignition," the former word no longer being suitable to their business.

THE Continental Tyre and Rubber Company of Great Britain, Ltd., announce a reduction in the prices of their Continental tyres.

MR. R. B. WHITEHEAD, the celebrated engineer who gave to the world the torpedo bearing his name, has now in use quite a fleet of Italia cars, the latest addition thereto being a six-cylinder model.

FROM the London and Paris Exchange, Ltd., Motor Agency we have received a copy of their fortnightly list of second-hand cars. In addition to the ordinary catalogue are some trade notes of current interest.

THE bodywork of the Daimler cars has always been admired and looked upon as the acme of perfection, and purchasers have always had a large number of designs to select from. Yet another type has been added to the already comprehensive list for the current season; this time it is an open touring body having ample accommodation for five passengers, which will be known as the "Bexhill." It will be fitted to the 30-h.p. and 38-h.p. live axle chassis.

FROM the Ariel Motors, Ltd., comes a copy of a new illustrated brochure they have just issued, giving full particulars of the 20-h.p. Ariel car they have lately introduced. A feature of the list is the numerous designs of open and covered bodies, which have been specially prepared to suit the chassis.

SO great has been the rush of applications for the oxydised copper ash trays offered to readers of the *M.C.J.* by the Swift Motor Company, Ltd., that the stock has been exhausted, notwithstanding that they had to order several hundred more trays.

THE Easter programme at Llandudno included the inauguration of the motor services through Snowdonia. These will continue daily throughout the season.

MESSRS. STANFIELD AND WHITE, LTD., have an extensive garage in Sidwell Street, Exeter. It is fitted with a turntable and every necessary plant for the repair of cars.

A 24-32-H.P. Vinot car, fitted with a limousine body by Messrs. Cole and Sons, Kensington, has lately been acquired by Mr. D. Stewart Dawson, of 12, Hyde Park Terrace, London, W.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

COMMENTS.

A CASE of some importance to motorists in and about Glamorganshire is reported on another page. In this a driver was summoned for driving a car "without having the identification plate so fixed that every letter and figure was easily distinguishable." It appeared that this was the first instance of a car fitted with a swinging plate having been stopped by the police, although a large number have been sanctioned by the Glamorganshire County Council, and have never been objected to by the chief of the police of the county nor of the city of Cardiff. The Order issued by the Local Government Board under the authority of the Act leaves the fixing of the identification marks under the direction of the registering council, and in Glamorganshire the swinging plate has, apparently, been officially sanctioned. In dismissing the case the magistrates drew the attention of the Council to the fact that the plates should be "fixed," and suggested that they should obtain and issue a bye-law to that effect. The position is somewhat exceptional, and it would be well if, in future regulations, no room for doubt was left by the L.G.B.

Berkshire A.C.

A MOTOR club that merits distinction in the home counties is that of Berkshire, which has Earl Roberts, K.G., for president and Major E. R. Portal as chairman. But for the active and disinterested support of this club, the tar-spreading competition held last year would probably have been of meagre extent, the splendid help of Major Portal's committee being a substantial factor in the success. On Saturday the club held its annual meeting, when the snowstorm that was raging kept many who would have been of the company away. That the members are appreciative of the good work done by their officers was, however, demonstrated by the presentation to Captain Waring, whose constant efforts to promote the social pleasures and local influence of the organisation are well known. In our "Club News" on another page we make reference to other interesting matters relative to the Berkshire A.C.

In the Upper Alps.

THE report in the daily Press of a serious accident to a party of British motorists in the Hauts Alpes revives painful memories of an accident which happened to our own party in the same neighbourhood some four years ago. We had travelled from Monte Carlo to Gap—a long journey, in the mountains most of the time, and where the ground was at all level, numbers of caniveaux—the previous day. The following morning we started at five for Le Puy and Clermont-Ferrand—a terrific journey, still over the Alps—but had not gone a dozen kilometres before we met three teams, a man driving one, and the other two walking loose behind. The third one came right across the road; swerving, we ran into a tree, and our party of four was scattered all over the road. The car was wrecked, and the sight generally was one that will live in our memory. The car was a 60-h.p., and we were on top speed. Fortunately, a

regiment of mountain artillery came along in a few minutes, and with them was a surgeon-major and men with red cross appliances. The doctor spent five hours with us, and we were then conveyed into Gap to the Hotel de Negotiantes, where if we had been in our own homes we could not have had greater attention paid to us. The nurses were the Little Sisters of the Congregation de la Providence. The name of the English family injured in the recent accident was Krummer, and they were conveyed to the above hotel at Gap, where we trust they will make a speedy recovery.

Where are the Police?

A BATCH of motorists were recently summoned before the Guildford County bench for exceeding the speed limit at Godalming, the net financial result to the county being the addition of about £20 to the revenue. In the course of the defence of Mr. L. W. Pullman, of Guildford, his solicitor asked the sergeant what would happen if crimes were committed when the police were drawn off to superintend motor traps. His reason for putting the question was that an organised gang of roughs in the Godalming district were in the habit of stoning motorists as they passed. He submitted that while the police were tracking the drivers of cars there were no officers to protect the motorists from the hooligans. This is a point that has been raised before, and is one which those who instigate the police to devote so much attention to the alleged delinquencies of those who travel should bear in mind. Whilst those responsible for the safety of public and property are thus diverted from their legitimate duty, rogues and ruffians make congenial holiday.

The "Extended" Trap.

MAJOR LANG is extending his system of police supervision of motorists and instead of the "short trap" is now indulging in what we suppose he would call the "long pull." Recently, several daily papers have gravely announced this as an innovation in police methods, but we remember that it was adopted by Lieutenant-Colonel Daniel, in Hertfordshire, almost at the inauguration of the present Motor Car Act. He, as chief constable of the county, had motorists timed over stretches of road of four or five miles. Major Lang is now said to have extended this system, and by a method of timing motor-cars in various places on the main roads and taking their numbers as they pass has added to the excitement of motoring on southern highways, at the same time circumventing those who have hitherto warned motorists when they seemed to be proceeding at a too great speed on the highway. Doubtless this will lead to the discovery of many devious ways to the seaside, for there is more than one way to Brighton from town.

Honours Even.

IN the "Daily News" on Tuesday the figures of the Board of Trade returns with regard to automobiles were set forth by Mr. J. S. Critchley, with a view to showing that, although "there may be excessive competition, the trade is very large." According to this expert there are seventy-six foreign makers advertising their goods for sale to the British public, giving a choice of 238 different models of cars, ranging from 6.8-h.p., and costing complete £159, to models having a

h.p. of 62.5, and costing over £1,000 without body work. On the other hand, there are said to be eighty-five manufacturers of motor vehicles in Great Britain offering to the public 215 different models. Mr. Critchley goes on to say that the average price of British cars is less than the foreign price, and, further, the price per h.p. is less. It is somewhat remarkable that the mean h.p. of the British and foreign models should be nearly equal, and it is further found that 46.9 per cent. of the British cars listed and 47 per cent. of the foreign cars are rated at over 30-h.p. This, in the view of the "Daily News" contributor, therefore goes to prove that the British and imported cars are, generally speaking, on an equality.

Motor-cars and the Cinematograph.

THE motor-car plays quite a prominent part in many of the cinematograph displays which, nowadays, form a popular feature of the programmes of music halls and other places of entertainment. One of the most amusing is that of a runaway car, which, driverless, proceeds on its way regardless of all obstructions. A new cinematograph film, in which an automobile and a dog form the subject, is that known as "The Dog outwits the Kidnapper," lately brought out by the Hepworth Manufacturing Company, Ltd. Outside the gates of a large house a motor-car draws up, and the sole occupant gets down,

"The Dog that Drove the Car."—Mr. Cecil Hepworth's dog "Blair" at the wheel of a motor-car.

and stoops down so as not to show his head above the gates, and, creeping up, peeps into the garden. Anxiously he waits, keeping a sharp look-out, until he sees a small child walk from the house down the carriage drive. All unconscious of the watching eyes, the child pushes her wooden horse along, and a collie dog freely dashes round her. As she turns to walk into the house again, the dog rushes in before her, leaving his mistress momentarily unattended. At this moment the kidnapper silently opens the gates, and, seizing the child in his arms, he places one of his hands firmly over her mouth, and, in spite of her frightened struggles, places her in the car and drives off at a break-neck speed. The man in his success does not notice that the dog is following to watch over his mistress. Road after road is traversed, and the car is not pulled up until a considerable distance has been covered. The man ultimately pulls up at an inn, and, with strict injunctions to the child not to move, goes to have a refresher. The dog, capering round the car for a moment, jumps up beside the child, and, putting his paw on the wheel, takes charge of the car. The animal, with wonderful sagacity, copying the style of drivers he has observed, slowly turns the vehicle round and takes his little mistress and companion home quite safely. Dashing open the front gates, he returns in a few moments with the child's mother, who, with tears of joy in her eyes, fondly grasps the child in her arms.

Motor Ambulances.

IN the course of an inquiry by the Southwark coroner testimony as to the value of the electrical motor ambulance has again been made. During the inquiry it was mentioned that the deceased had been taken to Guy's Hospital on a hand ambulance, when Dr. Waldo, the coroner, remarked, "Surely it would be better to have an electric motor ambulance similar to that we have in the City." He added the information that the police had informed him that by its use an average of 11½ minutes was saved on a journey. That, it should be remembered, is in the City with its "one square mile." It is obvious that in the larger area of the county of London the saving in time would be materially greater. The house surgeon at Guy's Hospital added his testimony to that of the coroner with regard to the motor ambulance, and urged that it would be desirable to have a similar ambulance in Southwark and localities equally closely congested.

The Speed Limit.

WISDOM seems to have prevailed at the meeting of the Pembrokeshire Main Roads Committee when they considered an application from the Tenby Town Council inviting the County Council to apply to the Local Government Board for regulations fixing the speed of motor-cars within the borough to ten miles per hour. The chairman, Colonel Ivor Philipps, M.P., pointed out that such regulations, if made, would react upon the prosperity of Tenby in a way that the promoters of the suggestion had not fully realised. If it were known that a speed limit of such a restrictive character was in force in the district it would be regarded as a place for travellers to avoid. So far as the dangerous streets were concerned the police already had powers to deal with motor traffic therein, and he urged that the application should not be persisted in. Other speakers pointed out that such regulations would be suicidal to the interests of Tenby and it was decided not to go forward with the application. The matter is of special interest just now, when so many towns which depend upon visitors for their prosperity are considering means of attraction. Certainly, if they wish to keep motorists away, they cannot do better than invite the Local Government Board to impose irksome restrictions. Probably at the end of the season the Tenby Town Council will realise that the Main Roads Committee of the county has acted wisely in the interests of the place.]

A Question of Garaging.

A CASE throwing some light on the rights of garage proprietors has been heard at Bournemouth, when Captain Cheesewright sued Mr. Mark Briant for £5 15s., alleged damage for the wrongful use of plaintiff's motor-car, or in the alternative, damages for breach of agreement. In outlining the case, Mr. H. Harker said the plaintiff was bringing the action as a matter of principle. The principal part of the claim was damages for unlawfully moving the car from one set of stables to another. Owners did not like other people tampering with their cars, and it was for that reason, and to establish that garage owners had no right to move cars without the owner's sanction, that the case was being brought and supported by the Automobile Association in the interest of motorists generally. Captain Cheesewright said it was agreed to garage the car at the Priory stables at the rate of 10s. per week. Witness left the car and called on the following evening to find out how early he could have it on the next morning. To his surprise he found the car was not there, and was told it was at the Belle Vue stables. For the defence it was contended that there was no stipulation expressed or implied that the car should remain at this particular stable. In summing up his Honour said he did not think plaintiff would have made any demur if he had been spoken to about the removal, but people did not like an alteration of that kind being made without it being mentioned. He did not think defendant was entitled to any portion of the 10s. for

garaging. He thought that 3s. would be reasonable for cleaning the car, but he could not allow 2s. for moving the car. Defendant would, therefore, have to pay back 14s. of the bill, and there would be judgment in addition for the plaintiff for 40s. damages.

Snow-bound Motorists.

THOSE, especially the motorists who happened to be in the south-west of England, who were out motoring last week-end had a unique experience. At Southampton over two feet of snow fell, while at Bournemouth, where the writer was staying, it snowed continually for ten hours, and there was a depth of eight inches of snow. The previous day we had motored to Weymouth, where we met Mr. C. I. Thornton, who has recently purchased a six-cylinder Berliet, which he seemed to appreciate very much. With him also was Mr. Gwinneer, on a 40-h.p. Mercedes. Several slight falls of snow occurred that day, but nothing serious. On waking up on Saturday morning we found the ground was white and the snow was steadily falling. Just after two o'clock Mr. Thornton turned up at the Canford, Cliffs Hotel—a most charming and comfortable

coroner, who uses a motor-car when "on circuit," was snowed up in his car thirty miles from home and had to return to Bournemouth by train. At Yeovil, in Somerset, the motor mail was snowed up, other means having to be adopted to convey the mails to their destination. One motorist returning to Worksop from Llandudno encountered a blinding snowstorm in Derbyshire on Easter Tuesday and he was three hours getting over the Snake. The L. and S.W.R. motor-omnibus plying between Farnham and Haslemere was prevented by the snow from getting further than Churt, and had to return. The snow-drifts were four or five feet deep. From the railway the great track at Brooklands looked like an oval frame for a conventional Christmas landscape. On Saturday the snowstorm lasted all day in Hampshire, and Mr. F. G. Lucas, of London, who was motoring with friends through the country, had to have his car dug out of three feet of snow near Winchester. Motor-cars also got snowed up in the streets of the city itself. In one thoroughfare a car got fast in a drift, and was followed by a wagon. A carriage was just behind, and then other conveyances drove up. Great difficulty was experienced in getting the road clear. Curiously enough, while the snow has been so severe in the south, we learn from Braemar that they have had no

MOTORING IN THE SNOW.

The above illustration does not depict a Swiss scene, but is reproduced from a photograph taken on the Hindhead on Sunday last.

hostelry—and awaited the arrival of his friend. They were determined to make an effort to get through to London, although they were informed that several cars were already hopelessly stuck and abandoned in the New Forest. However, we heard afterwards they had to give up the journey and spend the night at Bournemouth. On the Sunday Mr. Ernest Owers, who was staying in the same hotel with us, essayed the journey to London on his six-cylindered Napier, but he also reappeared at the hotel, having had to abandon the journey. For ourselves, we were returning on the Monday, but, considering discretion the better part of valour, left our car behind and came to town by train.

In the Snow.

EXTRAORDINARY has been the weather of the last few days, and it is extraordinary as we go to press. Arctic and pitiless in its alternating unpleasantness it has rendered motoring anything but a joy. Curiously enough the south seems to have suffered even more severely than the more northerly parts of Britain. In many parts of Essex, on the night of the 23rd ult., the automobile traffic was entirely suspended and the East Essex

snow recently. The general snowstorm of last week amounted to less than half-an-inch of a fall there, and that disappeared very rapidly. As we went to press on Wednesday the sun re-appeared after many days' absence from town.

The Trader's Register.

WHEN the novelists write sequels to popular works they are invariably unsuccessful; similarly Superintendent Marks has failed in his Gilbertian effort to create an impression on the mind of a Guildford motor agent. Last week we reported how Mr. E. A. Humphreys was summoned for driving an unregistered motor-car under circumstances which were fully and adequately explained—from the common sense point of view. Since then Mr. Humphreys has been brought before the court again—this time for not keeping a record of the number of the car which was unregistered. Fortunately the magistrates were able to see the absurdity of the case urged by Superintendent Marks and his men and dismissed the matter. The police failure was rendered all the more mortifying by the refusal of the Bench to their application to state a case in view of an appeal.

MR. JOYNSON HICKS, M.P.

THIS year Mr. Joynson Hicks has had two elections—one to the chairmanship of the Motor Union, the other to the House of Commons as the representative of North-West Manchester. It is rather remarkable that both the great national motoring organisations should have their spokesmen in the Commons, where, from opposite sides, they should be able to watch any legislation that is introduced with regard to the movement of which, in a special sense, they may be said to be the titular chiefs. Mr. C. D. Rose, M.P., of the R.A.C., and Mr. Joynson Hicks, of the M.U., should constitute effective leadership of the Motorists' Parliamentary party, in which Sir Henry Norman, the Hon. Arthur Stanley, and Mr. T. D. Berridge and others have conspicuous places.

The new M.P., who took his seat in the House on Wednesday, is no academic motorist, but has long been the owner of cars, his latest acquisition being a 35-45-h.p. Maudslay. As to the types that were prominent during his election campaign, their number is legion, with those of British origin predominating.

Mr. Joynson Hicks has already "won his spurs"—if the phrase be not regarded as a paradox—in connection with motoring matters. As solicitor to the National Traction Engine Owners and Users' Association he has been engaged in most of

the big cases involving questions of "extraordinary traffic," and his knowledge of the Law of Heavy and Light Mechanical Traction on Highways in the United Kingdom has been demonstrated in the work with that title which he wrote in the early part of 1906 in conjunction with Mr. C. A. M. Barlow, LL.D., M.A. This was published in 1906 by Sir Isaac Pitman and Sons, Ltd., and has become recognised as the standard volume on the subject with which it deals. Quick to see the possibilities of the motor vehicle in relation to commerce, as well as to pleasure, Mr. Hicks was one of the first members of the legal profession to specialise on that part of the law.

The chairman of the Motor Union is a cheery fighter, and it is characteristic that when his party lost several seats in Manchester at the General Election, he almost alone of the defeated candidates bade them be of good cheer and quickly prepare to secure a reverse of the position. He certainly has set the example. Doubtless the same tenacity of purpose will be shown by Mr. Hicks in presiding over the deliberations and securing the development of the Motor Union.

THE Board of Trade is considering whether the utilisation of the Union Jack in advertisements of foreign goods in this country constitutes an offence under the Merchandise Marks Act.

MOTORING NOTES FROM BOURNEMOUTH.

BOURNEMOUTH does not appear to have been by any means a Mecca for motorists this Eastertide, and the activity at the garages has not resembled that which was witnessed at Easter last year, when the accommodation was so taxed that many cars were "boarded out." True, in the intervening twelve months several additional garages have sprung into being, thus causing a more general distribution of favours. One of these was opened just a day or two before Good Friday, and so happily is it situated on the main road at Boscombe that space there was speedily at a premium. The garages in "Beautiful Bournemouth" are mostly public, the proprietors of the numerous well-appointed hotels preferring to avoid whatever risk might attach to having petrol and other inflammable liquids in proximity to their premises. There can be no question, however, that motor visitors are well catered for in Bournemouth. A recent visit to the Imperial Motor Works, near the Lansdowne, afforded evidence of this. Here there have been extensive enlargements during the past few months. Mr. E. J. M. Morant, of Brockenhurst Park, is joint proprietor of these works with Mr. H. G. Alexander, and his numerous motoring friends will be pleased to know that Mr. Morant and Mrs. Morant are thoroughly enjoying their present motor tour through France, Italy and Austria. The most conspicuous visitor of late leaving his car at Mr. Morant's garage is Lord Hartington, while other notable automobile enthusiasts seeking this friendly shelter have included Lord Atkinson, Major Wynne, Sir Francis Coxey-Wright, Mr. J. P. Shrubbs (ex-Mayor of the neighbouring town of Lymington), and last, but by no means least, Lord Montagu. His lordship has exerted great influence in automobile matters in Hampshire, especially in uniting motorists, and many still cherish memories of the "meet" which took place a few months back at his charming New Forest seat at Beaulieu.

At the "Motor Mac's" garage, opposite the Imperial Works, mechanical activity is always manifest. Motor Mac, by the way, is Mr. McArdle, who, during the Emperor of Germany's stay in the district last November, had the honour to act as official guide to the royal party, and was afterwards presented by the Kaiser with the Order of the Red Eagle. He, more recently, had another royal favour, supplying a car to the Princess Christian during her visit to Bournemouth. To his garage, naturally, go most Daimlers, he being the authorised agent for the Daimler Company in Bournemouth.

THE "Evergreen Valley," as Bournemouth continues fittingly to be described, has hitherto enjoyed an extraordinary immunity from snowstorms. It did not, however, escape the blizzard of last week-end, and as a consequence the pleasures of motoring had either to be reduced to a minimum or had to be abandoned. It is many years since a storm of such terrific violence and persistency has swept over the southern counties, and its effects were sadly felt at the different garages, hotels, and large boarding houses so far as motor guests were concerned. Until the fall of snow the roads, particularly the main ones, had been in very good condition. Christchurch, renowned for its historic Priory Church, is situated on the main road from Bournemouth to Southampton, and its local governing body, it is pleasing to note, is attempting to grapple with the dust problem, by experimenting along about a mile of road with a composition which it is believed will materially minimise the nuisance.

THE few cars which ventured out amid blizzard conditions on Saturday last had exciting experiences, some of which their chauffeurs refrain from commenting upon; although the weather was materially changed on Sunday, motorists declined to travel over the still dangerous roads. Since then the snow has rapidly disappeared, but rain has fallen so heavily that the roads, fairly loosened by the thawed snow, have now become so terribly sodden that cars travel under considerable strain, and are almost unrecognisable through bespattered mud. WESSEX.

GOSSIP FROM PARIS.

MR. HENRI FARMAN has shown me some of the letters he has received from persons of both sexes and of all classes of society in pretty nearly every country of the world, including China and Japan, since his successful flight. Among those missives the begging letters are so numerous that to satisfy the demands he would have to gain at least a dozen Deutsch-Archdeacon prizes. Then there are the applications of inventors who have made marvellous discoveries in aviation. One of them, living at Cape Town, has fathomed all the mystery of the flight of birds. The principle of that flight is so simple and so easily applied to a mechanical apparatus, that the discoverer abstains from putting it on paper, because if anyone at all acquainted with flying machines were to read it he could in a few days make an aeroplane capable of remaining in the air an almost indefinite time. He therefore demands nothing more of Mr. Farman than the money to pay his passage from the Cape to France to enable him to explain the matter to him. Presuming that a cheque will be sent to him by the next mail, the writer expresses confident hope that Mr. Farman will advance him the capital necessary to build his marvellous flying machines, and in that case the inventor would give him a fourth part of the net-profits of their sale!

SIMILAR letters have arrived from Russia and Austria. Indeed, it is astonishing how many inventors want the money to come to Paris. In the number is a Hungarian of good family who has designed a motor which would be fifty per cent. lighter and a hundred times more reliable than the Antoinette with which Henri Farman "only succeeded in flying a mile or so." With the Hungarian gentleman's motor he could fly from Paris to London! If he would advance him the money for his journey to France he would submit to him the technical drawings of the motor which is "destined to revolutionise aviation." This gentleman is more generous, for he offers 50 per cent. of the profits for the capital necessary to work the invention. The Cape of Good Hope inventor has a competitor at Johannesburg who has discovered what he calls "the missing link" in aerial navigation. He found out "the active agent by which birds rise, soar, and in a measure are propelled," and at once began corresponding with the War Office, promising to reveal his secret to authorised officials on certain conditions. But it is to be supposed the reply he received was not satisfactory, for he is "sick of the War Office methods," and asks Mr. Farman to send him the names and addresses of "several well-to-do gentlemen" with whom he could deal. How the principle he has discovered "could have remained a mystery so long is the biggest mystery," says the writer.

APART from the cordial congratulations received in such flatteringly large numbers there are letters from several persons who claim to share in the success. Some inventors have written long letters to tell Mr. Farman that from the description of his machine published in the newspapers they perceive he has applied the principle discovered by them. One of these gentlemen goes so far as to forbid Mr. Farman to use his aeroplane again or to show it to anyone without his permission. This inventor, who claims to be the real author of Mr. Henri Farman's machine, is an Englishman, who announces his intention to prosecute for the infringement of his patent rights if his injunctions are not complied with. Nothing but the Vienna postmark on the envelope indicates the origin of one of the most curious communications received by the winner of the Deutsch-Archdeacon prize. It is not signed and contains no address. Perhaps that might be expected, as it is a message from the other side of the Styx. The writer says he has been ordered by a spirit, who formerly lived on this earth in the town of Dortmund, Westphalia, to tell Henri Farman that to secure further success, and to solve definitely the problem of aerial navigation, he must change the place of his propeller. He must take it from behind and put it in front. The indication is vague and not exactly new. The person who transmits it from the

shade of the former citizen of Dortmund seems almost to excuse himself for troubling Mr. Farman with it by saying "Rest assured that I am acting solely under the influence of a superior will in the interest of an invention of the utmost importance for the human race."

THREE sheriff's officers were last week occupied in a rather novel fashion. Instead of serving writs they were each of them given a four hours' outing in a motor-car placed at their disposal by the President of the Automobile Club of their respective departments. But they were not driven about simply to admire the scenery. Every time they met a cow roaming about the road they had to stop to take legal note of it, and when a wagon occupied the middle of the thoroughfare or kept to the left instead of to the right, as it should do by the rules of the road in France, they had to put the fact on record in due legal form. They were brought back to their respective homes at sunset, after which hour their legal capacity to record violations of the law ceases. Consequently they were unable to consign in their legal reports the number of carts and wagons driven on the road after dark without any lantern. This interesting experiment is destined to prove to M. Barthou that the dangers of the road are chiefly due to the peasantry, who still seem to imagine that the highways belong exclusively to them.

THE legal documents of which the Marquis de Dion will make use in the Chamber, when the Bill for the regulation of the automobile traffic comes on for discussion, are most eloquent. The three sheriff's officers operating respectively in the Sarthe, Brittany, and Lorraine took cognizance of the fact that they met 215 cows roaming about alone without anyone to look after them, 53 vehicles of various descriptions abandoned by their drivers, 22 horses running about free, 2 flocks of sheep without a shepherd, 24 stray sheep, 6 pigs without a keeper, 32 vehicles in the middle of the road preventing the motor-car from passing, 32 other vehicles which kept obstinately to the left, 7 strings of carts or wagons each in the care of only one driver, whereas the law requires a driver for each vehicle, and 20 savage dogs which attacked the pedestrians and flew at the automobile without the owners calling them off.

THIS is the beginning of a serious agitation for the observation of the highway laws and the rules of the road not only by motorists but also by the drivers of horse-drawn vehicles, and especially by the peasantry. Round Paris, to the distance of some fifty or seventy-five kilometres, the country people are beginning to understand that it is to their interest not to let their domestic animals wander about the roads. I remember some years ago one of the competitors in the Paris-Vienna race told me he in one day ran over no fewer than sixty cocks, hens, chickens, ducks, or geese. The same chauffeur, who intends to compete in the Grand Prix race this year, has already driven down from Paris to Dieppe four times and has not killed a single fowl. That marks a decided improvement, but motorists are determined that the laws and regulations shall be observed by every one, and not only in the vicinity of the large towns, but throughout the country. They refuse to admit it is just that laws should be made against them, and demand that they be made in the interest of the public safety and their observance enforced on every one using the roads. What is good for the goose is good for the gander. The present bill elaborated by M. Barthou against automobilists, but made something like acceptable by the Committee of the Chamber, will probably be adopted; it has, however, already created what is likely to become an irresistible movement for the general revision of the highway laws and the regulations affecting all sorts of traffic. MARNEY.

IN the procession that followed the remains of Sir Henry Campbell-Bannerman from Westminster to Euston via Charing Cross Road we noticed two motor-cars—one occupied by Mr. John Burns, and one (an electric brougham) by Mr. Winston Churchill and Mr. Reginald McKenna.

CONTINENTAL NOTES.

The Builder of the first Petrol Car.

A memorial tablet has been fixed on the house in Malohin, Mecklenburg, Germany, where was born Herr Siegfried Marcus, who on the Continent is credited with the honour of building the first petrol motor-car. The vehicle was constructed in 1875, and is now in the possession of the Austrian Automobile Club.

The A.C.F. Grand Prix Race.

An army of workmen are now busily engaged on different points of the Dieppe circuit, in preparing the course for the forthcoming races, and no pains will be spared to make this year's organisation as perfect as possible. The drivers of the different racing cars are also busy training; Jenatzy, the well-known Belgian driver, has been on the circuit with a Mors racer which he will drive in the big event, while Théry has also been trying his Brasier; others who have been over the course

De la Buire cars were placed in service a few days ago, and by October next it is expected that no less than 120 petrol vans will be at work in connection with the collection of the mails in the French capital.

Belgian Motor-car Imports and Exports.

The value of the foreign motor-cars and parts imported into Belgium during the three months ending with March last amounted to £39,208, as compared with only £37,776 in the corresponding period of last year. There has also been a marked increase in the exports of Belgian motor-cars and parts—from £78,642 in the first quarter of 1907, to £115,695 in the first three months of the current year.

Steam Motor 'Buses in France.

Increasing attention is apparently being devoted to steam 'buses in France. Some trials have lately been made in Paris with one known as the S.A.G.E., built in Germany under the

A PUBLIC SERVICE IN THE TYROL.

On the Rolle Pass, 6,400 ft. above sea level.
On the Pordoljoch, 7,350 ft. above the sea.

Another point on the Rolle Pass.
At San Martino di Castrozza.

during the past few days include Maurice Farman and Heath, who are to drive Panhards, and the Itala team—Henri Fournier, Cagno and Piacenza (the latter replacing Fabry), and Minoia, who will be at the wheel of an Isotta-Fraschini. In order to allow the necessary repairs to be carried through without hindrance the A.C.F. has issued a notice closing the course for racing cars from May 1st until further notice.

Public Services in France.

Public services of motor vehicles are shortly to be inaugurated between Chantilly and Survilliers, and between Chantilly and Neuilly-en-Thelle (Oise). The vehicles to be employed will be of the De Districh type.

Motor Vehicles in the French Postal Service.

The twelve electric motor-vans which have for some time past been in use in Paris by the Post Office authorities are being withdrawn, their place being taken by petrol vehicles. Three

Stolz patents, while the Valentin Purrey Company, of Bordeaux, who have long made a speciality of steam wagons, have recently produced a new type of single-deck 'bus propelled by steam, which is being adopted for public service work in the Auvergne and Vendée districts, as well as between Cette and Frontignan on the Island of Corsica. The vehicles have accommodation for eighteen passengers, and can in addition carry from 8 to 10 cwt. of luggage; the road wheels are shod with steel tyres, but, on account of the special system of suspension adopted, it is claimed that the 'buses are as free, if not more so, from vibration than many fitted with rubber tyres. A speed of from 12½ to 19 miles per hour can be attained according to the condition of the roads and the gradients. Gas coke is used as fuel.

Motor Tourists in Baden.

Of the 419 motor-cars and cycles which passed the boundaries of the Duchy of Baden during the fiscal year October 1st, 1906—September 31st, 1907, seven came from Belgium, fifteen from

England, 118 from France, nineteen from Italy, eight from Holland, three from Austria, eight from Russia, 174 from Switzerland, sixty-three from the United States, two from Monaco and one each from Turkey and Spain.

Hill-Climbing near Lyons.

The annual hill-climbing competition organised by the "Lyon Sport" under the auspices of the Automobile Club du Rhone was held on Sunday last, over a 3.74 kilometre course, on the hill between Les Cheres and Limonest, when the best time of the day was made by a Berliet racer, 2 min. 50 sec. In the four-cylinder (from 91 to 100 mm. bore) touring car category the winning car was a Cottin-Desgouttes (4 min. 10 sec.), while in the 121 to 140 mm. bore section Lacharanay proved the winner, he covering the distance on his La Buire car in 3 min. 13.15 sec.

French Motor-car Imports and Exports.

A return just issued shows that the value of the foreign motor-cars and parts imported into France during the three months ending with March last only amounted to £54,600, as compared with £65,240 in the corresponding period of last year. As regards the exportation of French motor-cars and parts, the serious shrinkage which set in at the beginning of the year is still the predominant feature. The aggregate exports during the quarter just ended only totalled £1,192,400, as contrasted with £1,527,480 in the corresponding period of last year. With practically only one exception—the United States—there has been a falling off in the shipments to all the leading markets, the decline in the case of England being from £640,000 to £520,000.

A Motor Race-Track in Belgium.

The municipal authorities of Spa have decided to accede to the application of a French syndicate to establish a motor racing track near that resort. The plans that have been prepared provide for a track which will comprise several long straights as well as turns, and a slight gradient seven kilometres long.

Motor Buses in St. Petersburg.

A new motor-omnibus company has just been formed in St. Petersburg, and an order for ten vehicles has been placed with the Suddutsche Automobilfabrik, Gaggenau, Germany.

British Motorists in France.

Among the British motorists at present touring in France are Mrs. Wynn Sewell and Mrs. Roscol Washburn, 20-h.p. Renault; Mr. Miller and family, 40-h.p. Albion; Mr., Mrs. and Miss Stephens, London, 14-20-h.p. Renault; Mr. and Mrs. Bruce Ingram, London, 32-h.p. Mercedes; Mr. Alfred Belaieff, London, 45-50-h.p. Leon Bollee; Mr. Watson Low, 80-h.p. Gobron-Brillie; Mr. Chalton and Mr. Bell Pettigrew, 40-h.p. Argyll; Mr. Johnson, Leicester, 20-h.p. Delaunay-Belleville; Sir Robert and Lady Finlay, 50-h.p. Panhard; and Lord and Lady Cheylesmore, 40-h.p. Renault.

Miscellaneous Items.

The first motor taxi-cab in Liege has just made its appearance.—A public motor-car service for the transport of both passengers and goods has just been opened between Regensburg and Pfatter, Bavaria, a distance of twenty-three kilometres.—The date of the race meeting in Sicily has been altered. The Coupe des Voiturettes will now be held on the 10th, and the Targa Florio on the 18th May.—Twelve entries have now been received for the St. Petersburg-Moscow race, the additions to the list already given being a Darracq, a Sizaire, two Berliets, a Nagant and a N.A.G.—The Automobile Club de St. Omer (France) is organising a series of flying kilometre trials and a hill-climbing competition for the 7th June.—Some joint trials are to be made during the present month by the Austrian and German Motor Volunteer Corps.—Messrs. Stoewer, of Stettin, are building a 6-12-h.p. fire service wagon for the Stettin Fire Brigade.—The French Post and Telegraph Authorities are inviting tenders for the carriage of the mails between Bourges and Argent-sur-Sauldre (Cher) by motor vehicles.

THE REMO 18-H.P. CAR.

THE Rex Motor Manufacturing Company, Ltd., Coventry, who have been building motor-cars for about eleven years, are now devoting attention to the Remo 18-h.p. car, which comprises a number of interesting features. The motor consists of four separate cylinders with the valves disposed on opposite sides. The bore is 86 mm. and the stroke 110 mm., giving, according to the R.A.C. rating, 18-24-h.p. The distribution gear is entirely enclosed, and the shafts driving the high-tension magneto and water circulating pump are provided with universal joints to ensure perfect alignment. The valve tappets are of ingenious design, being kept up to their work by springs, fibre under-buffers being provided to prevent noise. The Trier and Martin triple-jet carburettor is fitted. The crank case is divided horizontally, the main bearings being attached to the top half, so that they are not disturbed when the bottom half is removed, enabling the big ends of the connecting rods to be adjusted with ease. The engine is lubricated by pressure feed from the dashboard. The crank case is partitioned off for each respective cylinder to ensure the proper distribution of the lubricating oil.

The power from the engine is transmitted to the gear-box through a large diameter leather-faced cone clutch. Three forward speeds are provided, the top, of course, being a direct drive through a cardan-shaft to the live axle. Ball bearings are fitted to both shafts of the gear-box. The back axle is of an interesting design. The brake and spring brackets are attached to the bevel gear-box by means of substantial steel sleeve tubes screwed into the latter. The spur pinion differential gear is con-

tained in a cage bolted to the bevel wheel, which forms part of the cage, the whole revolving on large ball bearings having $\frac{3}{4}$ in. diameter balls; these bearings are adjustable from the outside by means of locking rings which work on plungers behind the ball races. The rings are held in position by set pins placed conveniently for adjustment. The bevel pinion is supported by ball bearings at both back and front, in addition to the ordinary ball thrust bearing. Thus, by means of the double set of bearings above and below the teeth of the pinion, the driving pressure is resisted in a way that is impossible with a single bearing, and the cardan joint is also relieved of strain. The locking rings to both bearings permit of the most intimate adjustment, and are readily accessible. The floating axles are fitted with ball-bearings, which are likewise adjustable by external rings, and the weight of the car is removed from these shafts by an effective external casting, which is also an oil retainer for the lubrication. The axle is fitted with tension rods as well as with a double torque rod working on a universal joint.

Our Midland representative has driven one of the new Remo cars about 1,000 miles, and reports that not only is it extremely quiet in operation, but is both speedy on the level and an excellent hill climber, a recent trip from Coventry to Newcastle-under-Lyme being made without changing speed. One great feature of the car is its freedom from skidding, owing to the careful manner in which it has been designed so as to not only bring the weight as low as possible to the ground, but also to evenly balance it between the wheels. The vehicle is given a striking appearance by an artistic form of petrol tank and dashboard. As a whole, the new car, which is fitted with a five-seated side-entrance body, is a noteworthy production, especially in view of its relatively low price.

THE "UNION" CARBURETTOR.

WE illustrate herewith a new carburettor known as the "Union," devised by Mr. C. Skinner, and lately put on the market by Messrs. George Wailes and Co., Euston Road, London, N.W. In designing the apparatus the principal object was to make a carburettor that will supply an engine with mixture correct in its proportions of petrol and air, no matter at what speed the motor is running, also to allow the engine to be run and fire regularly at a dead slow speed without waste of fuel, while obviating any back pressure at high speeds. It was also sought to eliminate all springs and auxiliary air valves. In order to get a motor to run fairly slow many present-day carburettors have to depend on an auxiliary air valve to weaken a mixture that would otherwise be too rich when the engine runs at a high speed. It was considered that this was not a satisfactory or scientific manner of supplying a motor with its fuel, and that even if it were, springs and valves cannot be depended on to always act alike.

To obtain a sufficiently rich mixture to keep the engine running dead slow but to prevent waste of spirit, it is necessary that the petrol should be most minutely broken up, and in a carburettor of the spray type, depending on the suction of engine for the necessary draught air, an extremely small aperture is necessary

Sectional View of "Union" Carburettor.

in order that the pressure of air past the jet shall be sufficiently fast, an air space surrounding the jet of 1.20 in. being sufficient to keep the engine going—running free and very slowly. On the other hand, at a high speed, fully loaded, the air space surrounding the jet should be of considerable area and proportioned to the size of the induction pipe if back pressure and the use of an auxiliary air valve is to be avoided. In the opinion of the designer it therefore seemed necessary, to make a carburettor satisfactorily fulfilling these very different conditions, that the space surrounding the jet must vary with the requirements of the engine, and, secondly, that the supply of fuel must vary in proportion to the space through which air flows, the result being a more or less constant speed of air travelling past the jet, the carburettor measuring the petrol in correct proportion to the amount of air.

The "Union" carburettor in its present form is the result of several years' experiment and almost every-day road use. It is quite automatic, depending entirely on the suction of the engine to fulfil the above conditions. Before starting up when fixed on an engine, the piston A is closed down on the part of carburettor B, the petrol supply being almost entirely cut off by the needle valve C, working in the jet D. The suction of the engine, on being turned, sets up a slight vacuum in the chamber of the carburettor X, also in the flexible chamber F, which is in communication with X by means of the port G. This is sufficient to act on the disc Y, causing this to slightly lift, at the time raising the

piston A, allowing the air to pass by the jet D and suck out the required quantity of petrol. The very small space between the piston A and the seat B causes an intense draught at this point which minutely breaks up the petrol. As the engine increases in speed the greater vacuum in the chamber X relieves itself by further sucking up the piston A, at the same time withdrawing the needle C further out of the jet. The needle being tapered allows a greater space for petrol to flow between itself and the sides of the jet. Therefore the faster the engine runs the higher the piston A lifts, the greater the space through which the air flows, keeping its speed more or less constant, but with the proper proportion of petrol allowed to mix with it. The whole of the part J, including the piston A and needle C, can be easily removed to make any adjustment in the supply of petrol by an alteration of the needle C.

Petrol is supplied from the float chamber through the centre of the set screw K, which also holds the float chamber to the main portion of the carburettor in such a way that it can revolve almost around it, and be finally tightened up when it has assumed the most convenient position for the engine to which the carburettor is being fixed. In use it is found that the suction of an engine is so constant that so long as it runs at a certain speed with the same load the piston A maintains the same position without any perceptible up and down movement, but assumes an altered position immediately the slightest variation of the engine's requirement occurs. The shape of the needle, of course, has a great influence on the supply of petrol, therefore in tuning up an engine to get the best results it is possible to give a greater or less amount of petrol at a certain speed by a slight alteration of the shape at a particular point without upsetting the running of engine at other speeds. Messrs. Wailes claim that it is possible to drive a 35-h.p. or 40-h.p. car fitted with their carburettor all over London in traffic on top gear without dropping to the lower gears unless the car is brought practically to a standstill; at the same time the engine will pick up rapidly on opening the throttle. Out of traffic the largeness of the aperture for the passage of air at a high engine speed gives the motor its full power, and the fitting of one of these carburettors in some instances has, we understand, effected an increase of h.p. on the brake test of as much as 12½ to 15 per cent.

THE London Electrobuses Company have decided to extend their Metropolitan service by the addition of 150 vehicles.

THE Duke of Grafton, K.C., has placed an order with Messrs. W. and F. Thorn, of Great Portland Street, W., for a 35-45-h.p. Maudslay car to be fitted with a limousine landaulet body.

TIMES have changed since the early days when an M.P., attempting to reach the House of Commons by motor-car, was frustrated by the inspector on duty, who would not allow entry into the Palace Yard until the Speaker of the House had been consulted. Official sanction has now been given the presence of automobiles within the precincts of Westminster, a badge having been issued to the chauffeurs of members of Parliament which secures their entry into Palace Yard and also their passage through police cordons when the traffic is held up in the vicinity of the Houses of Parliament.

MR. H. J. SPOONER, whose work in connection with automobile instruction at the Polytechnic School of Engineering, Regent Street, London, W., is well known, has brought out a new book on "Machine Design Construction and Drawing." It has been published by Messrs. Longmans, Green and Co., and is a textbook for the use of young engineers. The first five chapters are devoted to the drawing part of the subject, the remaining section dealing more particularly with matters relating to design and construction. Various pages deal with shafting, keys, riveted joints, cotters, bearings, gearing, &c., while the materials used in the construction of the machines and tools are fully considered. The work is fully illustrated with over 1,400 figures and eighty-six tables, and bears evidence of the careful preparation which should make it become a standard work for all engaged in the teaching or study of machine design.

MOTOR-CARS AND MOTORING IN SPAIN.

A LENGTHY report on the trade and commerce of Spain in 1906, prepared by Mr. S. P. Cockerell, Commercial Attaché to H.M. Embassy at Madrid, has lately been issued. Among the subjects dealt with is that of the development of the automobile movement in the country, from which we take the following extracts:—

Bad roads, dear petrol, and loss of wealth in the Cuban War have all contributed to the slow development of the motor business in Spain, where motors are still essentially an *article de luxe* and for commercial purposes are practically unknown. Moreover, as regards Madrid itself, which is the best market of Spain, the city covers but a small area and is surrounded by somewhat desolate country and doubtful roads, and the streets of the town itself are, as a rule, peculiarly unsuited to rapid locomotion. There is wealth also in Barcelona and Bilbao, but Madrid is the spendthrift city of Spain, and this is its most striking characteristic. Probably in no city is the proportion of private carriages to wealth so great as here, and in this direction there is a considerable field for a cheap motor which will put this fashionable method of getting about within reach of the persons of very moderate income who now drive about in a carriage.

Motoring in Spain is under the protection of the Real Automovil Club de Espana, which does for the industry in general what is done by similar societies in other European countries. There is no club certificate for chauffeurs, such as is given in the United Kingdom, and the only regular certificate of confidence which a chauffeur can obtain is the municipal one, which is given upon a declaration by a responsible person that the candidate has shown aptitude and has practised the handling of motor-cars during the previous six months. Chauffeurs' wages vary from £6 to £10 per month.

The representatives in Madrid of motor-car manufacturers have formed a society, presided over by Senor Crespo, for the protection of their interests—a matter of some importance in a country which revises its Custom tariff every five years—and they are, among other things, endeavouring to obtain a reduction in the price of petrol, and intend to establish an examination and certificate for chauffeurs, such as that of the Royal Automobile Club in England.

The Sociedad Hispano-Suiza of Barcelona exploits the Barcelona and Valencia markets, where the proximity of their works and the clannish character of the people are of great advantage. The capital of the company is £40,000, and they are enlarging their works, so there is presumably an increasing demand. There was a so-called *Fabrica* at Puerto Sta. Maria (Cadiz), but this has now been transferred to Cordoba. There is also a newly-established factory at Bilbao. A company for the construction of automobiles has recently been formed in Vitoria under the title of "Sociedad Constructora de Automoviles," and has acquired buildings and part of the machinery of a factory in Alava.

A contract has been made for ten years by the Madrid postal authorities for the carriage of the mails in the city by motor vehicles. For this purpose there are in use eight 16-h.p. electric motor-vans by Messrs. Milde, and two 24-30-h.p. four-cylinder petrol cars by Messrs. Filtz. The only car to be seen in use for industrial purposes is a 24-h.p. Aries furniture van, but there are three other lorries registered.

There appears to be some difficulty in Madrid in getting repairs done, and complaint is made of the delay necessary to replace broken parts from Paris, and this would be still more the case from the United Kingdom. Steps are being taken to remedy these difficulties. The most important workshops which are being installed are probably those of the Madrid-Automobil and Senor Cervera; the former, which is agent for the Renault and Mercedes cars, is a company formed of influential persons in Madrid, and has a large motor house in the Castellana (a most convenient situation). They are enlarging their premises

and have engaged an experienced carriage builder with a view to building the carriage work for chassis. They also intend to store spare parts. Bodies are being built in Madrid with satisfactory results, and many purchasers prefer to have the body built on the spot, although the difference in price is not inconsiderable.

There is a local tax in Madrid of 10 pesetas per horse power per annum, and owners have to register their cars. There are 304 cars and 4 lorries on the register for 1906. This might afford a fair guide to the business were it possible to rely on such statistics. All that can be said for them is that they show there are not less than 304 cars in Madrid, of which 51 are Renaults, 50 Panhards, 29 Kriegers, 23 Gobron-Brillies, 16 De Dions, and 14 Mercedes. Persons in the business estimate the true figure at somewhere near 1,000.

Since July 1st, 1906, the Customs duties on motor vehicles have been as follows:—

Class 564.—Frames of iron or steel, weighing up to 1,000 kilos each, for ordinary road carriages, with or without motor, 80 pesetas per 100 kilos. gross weight.

Class 565.—Frames of iron and steel, weighing more than 1,000 kilos., 100 pesetas per 100 kilos. gross weight.

Mr. Gordon Umar at the wheel of a Vinot 16-24-h.p. Car.
The Open Country Road. [Omnia.]

Class 571.—Motor carriages, open, with or without motor, pay duty corresponding to frames, according to weight, plus 200 pesetas.

Class 572.—Motor carriages, closed, with or without motor, pay duty on frame according to weight, plus 320 pesetas.

Note.—To determine the weight of the frame deduct from the total weight of the carriage 200 kilos. in the case of Class 571 and 400 kilos. in the case of Class 572.

Prior to July 1st, 1906, there was no special class for motors in the tariff, and the Customs statistics do not, therefore, show any figures for importation.

MESSRS. DENNIS BROTHERS have sent us a photograph of a 35-h.p. traveller's brougham they have lately completed for Messrs. J. and I. Watts and Co., Manchester. The front seats of the vehicle are entirely enclosed, while the back portion is fitted with detachable shelves to carry travellers' samples. The car is geared to a maximum speed of 20 miles an hour, ample power having been provided in the engine to enable any gradient to be ascended on the top gear. The road wheels are fitted with De Nevers solid rubber tyres, twins being employed at the rear.

The Causes of Motor-Car Accidents.

NOTWITHSTANDING the cold, wintry weather experienced, Easter saw the opening of the 1908 season, all the main roads being literally alive with cars big and little. Unfortunately the holiday was also marked by a large number of accidents, some of a minor character, but a few of a serious and, indeed, a fatal nature. The accidents have resulted from various causes; many have occurred at cross-roads, which form one of the greatest dangers of modern traffic; others have been due to collisions with cyclists and pedestrians; while a few, it must be admitted, have resulted from excessive speed on the part of the drivers. As a motor-car accident generally ends in a forced visit of the vehicle to the workshop of the manufacturer or a repairer, the latter are particularly well situated to give an idea of the principal causes of motor-car accidents, and the following views of several well-known members of the trade will therefore be read with interest. It will be seen that cross-roads are given a leading position in the list of causes. As most roads intersect each other at right angles or near so, and as hedges and fences are rarely low enough to enable the motor-

others were damaged at cross roads, and another one was injured at a sharp S turn—one of the cars being on the wrong side. Our repairs are generally overhauls, and we consider the low percentage of accidents remarkable taking into consideration the large number of cars which are on the road to-day."

Mr. T. C. Pullinger's Views.

Mr. T. C. Pullinger, of Messrs. Humber, Ltd., Beeston, writes:—"As far as I can see the greater number of accidents are caused by reckless and incompetent driving; a large proportion of the repairs which come into our works are cars which have run into tramway standards, telegraph posts, walls, or failed to clear bridges, &c. Taking corners too quickly is another great cause of accident, and one that I have in my mind at the present time was caused by attempting to enter a garage at about twenty miles an hour, and misjudging one of the door posts, to the detriment of the door and the car."

Messrs. Mann and Overtons' Experience.

The opinion of Messrs. Mann and Overtons with regard to the most fruitful cause of motor-car accidents is to the effect that a very large proportion of them are due to side-slip, and a large number owing to collision with horse-drawn vehicles. "The cause of most of these collisions has been due to the drivers of the horse vehicles pulling sharp across the motor-car without giving notice of their intention to do so. We have had no accidents at all brought to our notice that have been due to collision at cross roads, and it is our opinion that drivers are now very much more careful in taking corners and passing cross roads than they used to be.

Mr. C. Jarrott's Opinion.

Mr. C. Jarrott remarks that, "I would like to put it on record that from our experience in the repair works with regard to the cause of the majority of breakdowns in connection with motor-cars, the general cause is through neglect. Ignorance is, of course, responsible for a number of troubles, but the great cause of trouble is carelessness and neglect in regard to:—1, lubrication; 2, adjustments; 3, rectifying trivial troubles before they become worse. Many people are inclined, when some small thing goes wrong with the car, to go on running it instead of having it attended to. For instance, it very often happens that the engine develops a knock, and instead of having it rectified the user goes on running the car until it becomes serious, and grave damage is caused to the motor. So far as actual accidents on the road are concerned, I should certainly say the majority are due to sideslips."

The Napier Cars.

Mr. S. F. Edge writes that he has gone into the matter with regard to repairs to Napier cars, and, "so far as one can trace, about 75 per cent. or 80 per cent. of the accidents are attributable to bad judgment or carelessness on the part of the drivers. Most of these accidents happen at the junction of cross or adjoining roads, and generally through the car skidding, the cause really being excessive speed at unsuitable places. The remaining 20 per cent. seem to be unavoidable accidents where the driver has been in the right—careless pedestrians rushing suddenly across the road or coming out behind some other vehicle. In some cases it has been caused through other cars coming out backwards from a side road, but excessive speed at unsuitable places is really the key to the bulk of the accidents."

MESSRS. WILLIAM ELDER AND SONS, LTD., have opened a garage and repair shop at Castlegate, Berwick-on-Tweed, where they will always have on hand a large stock of tyres, spares, and accessories; vulcanizing will be undertaken and accumulators charged on the premises, which will have accommodation for 100 cars.

A Group of well-known People in a Six-cylinder 30-h.p. Napier.
The names of the passengers, reading from left to right, are:—Miss Violet Brooke-Hunt, the celebrated authoress and Organising Secretary of the Women's Union and Tariff Reform Association; Earl Stanhope, and Mr. Mackenzie King, C.M.G., Deputy Labour Minister for Canada, at present visiting this country in order to consult with the Foreign Secretary concerning the Japanese immigration question.

ist to see an approaching automobilist, the two often become aware of each other's presence when it is too late to avoid a collision. An unwritten law that is generally recognised is that he who travels along a main road has precedence of anything he may meet emerging from a byroad, but the distinction between one and the other is not always very clear, even where the district is familiar, and, consequently, the constantly-repeated advice that the horn should always be sounded and the speed reduced when reaching cross roads, so that the car can be quickly pulled up in case of necessity, should be seriously taken to heart. The chances of accidents on country roads would, of course, be much less were the corners rounded, and no obstacles to vision, such as high hedges, fences, &c., allowed to exist at such points. In time, when the exigencies of modern road travel are better understood, improvements of this kind will no doubt be effected, and then cross roads will lose much of their danger for motorists.

The Clement-Talbot Co.'s Experience.

Mr. T. H. Woollen, the general manager of Clement-Talbot, Ltd., informs us they have had very few damaged cars brought into their repair shop. "One was the result of a railway crossing being closed which was immediately round a sharp corner. Two

THE St. Bride's Press, Ltd., announce for early publication a book by Mr. Reginald Ryves, under the title of "The King's Highway."

To prevent puncture a German inventor has devised a protective band composed of layers of thin sheets of mica enclosed in a casing between the outer cover and the air-tube, or embedded in the cover.

THE Medical Department of the United States Navy at Washington has lately acquired an electric motor ambulance. The vehicle has a speed of twelve miles per hour and a radius of forty miles on one charge of the battery.

THE CRAIG VENTILATING AND OZONE COMPANY, of 427A, Strand, W.C., have brought out a special electrical ventilating fan, which is so arranged that it can be also used to rapidly and economically re-charge ignition accumulators.

AT Cadzow Bridge, Hamilton, the Lanarkshire Motor Company have opened a garage with Mr. Edmund Tainsh as manager. In addition to the usual stock of accessories, &c., the firm have the agency for Argyll cars and will also undertake repair work.

MESSRS. DAN LEAVY have a well-equipped motor garage at Dundalk, to which Mr. T. J. Leavy has just returned after qualifying for vulcanising tyres by a course of instruction at Messrs. Harvey Frost and Co.'s tyre repair school in London.

MR. S. F. RANFORD, who has a motor garage at Barnet's Green, Great Malvern, has been very busy with repair work during and since the Easter holidays. Several well-known motorists visited the town, and obtained supplies of petrol, &c., from his well-arranged stocks.

THE total number of motor vehicles and cycles in use in Germany increased from 27,026 at the beginning of 1907 to 36,022 at the commencement of the present year, or about 33 per cent. Of the total, 34,244 serve mainly for carrying passenger transportation, and 1,778 for goods transportation.

AT a meeting of the Roads and Bridges Committee of the Holland County Council, held at Spalding, a discussion took place with regard to exempting vehicles during harvest operations from carrying lights at night. It was decided to recommend the County Council to make an order exempting vehicles engaged in harvest operations from carrying lights from June 20th to October 20th.

MAYFAIR is not nowadays the rural district of London that it was when the Maypole was erected somewhere near the site of the existing Curzon Street, but there is some evidence that the reputation which the neighbourhood once enjoyed is likely to be revived. Hidden away behind what is now Hertford Street the "Daily News" has discovered that there has been constructed on the roof of a garage a magnificent tennis court, which is literally among the local chimney-pots.

WE mentioned a month or so ago that a special plant had been installed in the club-house of the New York Automobile Club of America for testing the horse-power of motor-cars as developed at the road wheels of the vehicles. The dynamometer is now in regular operation and we append the results of some recent tests:—

| Car. | H. P. Rating. | | Maximum H. P. at Wheels. | Miles Per Hour. | Gear in Use. |
|---------------------|------------------|-----|--------------------------------|--------------------|-----------------|
| Pope-Hartford ... | 30 | ... | 25½ | 36 | 3rd. |
| Westinghouse ... | 35-40 | ... | 30 | 25½ | 2nd. |
| Stoddard-Dayton ... | 40 | ... | 30 | 43 | 3rd. |

THE Duke of Westminster has lately been for a motor tour along the Riviera and the Italian coast of the Mediterranean.

THE Mexican Railroad Company is carrying out some comparative trials of the delivery of parcels by motor-van as compared with horse delivery. The test is being made with an Argyll vehicle.

MESSRS. CASTLE AND SONS, of Victoria Square, Worksop, have a garage where they are able to execute all descriptions of repairs, supply spare parts of every kind, charge accumulators, and, generally, send the motorist on his way rejoicing. A special department for motor bodies has also been organised by the firm.

IN the new "Eyquem" sparking plug which is being marketed by Messrs. A. W. Gamage, Ltd., are a number of points which should facilitate its introduction to practical motorists. It is a well-made device, and its various good points will be understood from the accompanying illustrations. It combines a plug, compression tap, spring terminal and short circuiting device. There is a tubular central lead, the top of which forms the tap through which petrol may be injected to

facilitate starting up, the petrol thus getting well to the sparking points. It can be used as a compression tap where necessary. The spring terminal is simplicity itself, the wire being held quite secure. It can, however, be slipped off in a second. The short-circuiting device obviates the annoying process of unloosening wires, unscrewing plug, &c., to test the spark. By turning the insulated button the motorist can tell at a glance if all the cylinders are being fired. Furthermore, if the button be turned to the spark-testing position it is impossible for interfering hands to start the engine.

MESSRS. SIMPSON, STRICKLAND AND CO., LTD., the well-known yacht builders of Dartmouth, have been successful in obtaining an order for a high-speed steam yacht. The boat is to be built of steel, 130 ft. in length, and is to be fitted with two sets of triple expansion machinery and two water tube boilers. The conditions of the contract call for a speed of forty kilometres, that is 24.85 miles in the hour, on a four hours' trial, so that the boat will be one of the fastest yachts in the world. It is interesting to note that the owner is M. Jellinek Mercedes. The boat is required for short trips in the Mediterranean to ports lying about 100 miles from Nice, where he resides.

RUMOUR has it that another attempt will shortly be made to climb Snowdon by motor-car.

THE toll levied on motor-cars at Whittlesea, on the main road to Wisbech, is 2s. per vehicle.

THE first motor-cycle race at the new Stadium at Shepherd's Bush will be held on May 11th. The Finchley Harriers are holding a meeting there, and included in the programme will be a five miles motor-cycle handicap, open to genuine touring machines not exceeding 90 by 90 with a 4 to 1 gear.

IN connection with our recent article on the setting of the valves of petrol motors, Mr. L. Delphin, the managing director of the British Motobloc Syndicate, Ltd., has sent us the accom-

panying diagram of the setting adopted on the engines of the Motobloc cars. As will be seen, the exhaust valve is timed to open early—45 deg. before the end of the explosion stroke of the piston, and to close late—5 deg. down on the suction stroke. As for the inlet valve, this opens late—11 deg. down on the suction stroke, and closes late—11 deg. up on the compression stroke.

IN our report of the Brooklands Easter meet we referred to the celerity with which the tyres of the two Ford cars in the Tyre Change Plate were changed. We are informed that the vehicles were fitted with the standard tyres ordinarily supplied with these cars, and that they were changed in almost exactly the same time, viz., 1 min. 30 sec.

DESPITE the unseasonable weather that we have lately had, many motorists have found their way into Derbyshire, where a large number have been entertained at the Crescent Hotel, Buxton, which has a couple of garages. Among the visitors were Mr. J. Whittaker, on a Horbick, and Messrs. R. L. Johnson, Noble and Ratcliffe, the latter each journeying on Siddeley cars.

MESSRS. J. B. FERGUSON, LTD., of Belfast, have decided to establish a motor service in the district known as the Ards Peninsula, co. Down, Ireland. Owing to lack of direct railway communication this important centre has been almost entirely isolated. The Argyll motor vehicle which they placed on the road between Belfast and Portaferry on February 1st for a month's trial has given the Post Office authorities such satisfaction that they have just entered into a contract with Messrs. Ferguson, Ltd., for the conveyance of the mails. The car at present running is of the private station brougham type, and does not accommodate a great number of passengers; but we understand that Argyll vehicles to carry a large number of passengers are at present under construction, and will be on the road in a few weeks. In addition to the present service, which leaves Belfast at 6 a.m., and arrives at Portaferry at 8.45, it is also proposed to run a morning service between Portaferry and Newtownards, and an evening service between Newtownards and Portaferry; also mid-day services between Newtownards and Bangor, and *vice versa*, and in the summer season between Bangor and Donaghadee, and probably to Ballywalter.

VISCOUNT AND VISCOUNTESS INGESTRE have gone abroad on a motor tour, and expect to be away until the end of June.

THE magistrates at the Steyning Petty Sessions have refused to allow time for the payment of fines in recent motor-car cases.

DURING the month of March the Ford Motor Company received *bona fide* orders with actual cash deposits for no less than 1,321 Ford cars.

NEW premises have been acquired by the West End Motor Company in the vicinity of their present garage at 72, Great Western Road, Glasgow.

AT Cupar, in Fifeshire, Messrs. Walton have opened a motor garage, which is capable of accommodating a score of motor-cars. Facilities for repair work are also provided.

AT Stranalar, the dispensary medical officer, who uses a motor-car in his practice, has secured the conviction of a farmer who obstructed his free passage on the public road by backing a cart across the highway.

THE East Grinstead Motor Garage, situated opposite the Station Road in the London Road, East Grinstead, has cars to let on hire, and every appliance for dealing expeditiously with all classes of motor repair work.

THE second edition is to hand of the Autocar Handbook, published by Messrs. Iliffe and Sons, Ltd. This has been entirely revised and nearly 100 illustrations materially assist in explaining the text of this useful guide to the modern motor-car.

MESSRS. WOOTTEN, LOW AND Co. have opened premises in Smithford Street, Coventry, as a garage and repair depot. Mr. James Low, who will personally superintend the repair department, will be remembered as driving a Swift car in last year's Scottish reliability trials. It is the intention of the firm to thoroughly equip their establishment in all its branches, and a vulcanizing plant has been installed.

ONE of the perplexing problems that motorists on tour have to solve is that of the transportation of luggage. Every available corner is utilised, and where trunks are made for exterior accommodation care must be exercised in their colouring as well as contour. Messrs. Alfred Dunhill, Ltd., are making ingenious and well-directed efforts to assist motorists in this direction, and at their headquarters, 359-361, Euston Road, N.W., they have several good types of trunks for the back of the car as well as for other positions thereon. These are made of compressed fibre, covered in waterproof canvas, and painted and varnished to match the colour of the car. They are impervious to both dust and rain, and can be manufactured to fit in any other part

of the vehicle where desired—under the seat, on the step, &c. We illustrate a novel idea for the utilisation of the roof of the car in such a way as not to detract from the general appearance. These roof trunks are made in sets of two or three as desired, their lightness being an important point in their favour. The measurements required for such trunks are the height of each box, the size of the grid at the back of the automobile, and an exact template showing the curve of the rear of the vehicle. In addition to these excellent trunks, mention may also be made of the circular valise, the Kennard valise, the folding tool box, and other good types of accessories of real convenience and pleasing appearance.

A PIONEER MOTOR-CAR BUILDER.

FOR many years thousands of engineers had been aiming at the invention and construction of a car capable of travelling on ordinary roads by its own means, but most of the attempts to reach this end proved failures, on account of the engines propelling these vehicles being too heavy and cumbersome. It was, therefore, indispensable to find a motor which, with the smallest size and lightest weight, would give the highest obtainable horse power. Herr Carl Benz, of Mannheim, the inventor of a light petrol stationary engine with which he

The First Benz Car, 1885.

had been doing business since 1878, considered this type of motor as the most suitable for the purpose, and thanks to his long experience with these stationary motors, which were, however, too heavy for locomotive purposes, he succeeded in 1885, after many years' experiments, in building a comparatively light motor, and, in connection with it, a light vehicle, in the form of a three-wheeler. This was, in fact, the very first motor-car driven by a petrol engine, and afforded accommodation for two persons. The car was of light construction and the engine developed $\frac{3}{4}$ -h.p. Electric ignition was furnished by means of a small dynamo.

The reason Herr Benz had for considering a $\frac{3}{4}$ -h.p. engine powerful enough is of interest. His previous trials and calculations of road resistance with three-wheelers had given a required energy of about 40 kilogramme-metres for a tricycle for two people. Acting on this, he built his motor to give $\frac{3}{4}$ -h.p., but, as very often is the case, he discovered that difficulties other than those generally taken into account in theory had to be dealt with.

The vehicle attained a speed of 12 kilometres ($7\frac{1}{2}$ miles) per hour on flat roads and could overcome gradients of about 2 per cent. with two passengers. The water jacket round the cylinder and water provision were small, the distance covered at a stretch never exceeding $7\frac{1}{2}$ miles, when a stop was required for replenishing fuel, &c. These beginner's results were, nevertheless, considered satisfactory, and spurred Herr Benz on to other improvements.

The disposition of the car is interesting. It was feared that the live force of the fly-wheel, if mounted vertically, would interfere with easy steering, and it was therefore arranged to run horizontally. Later experience showed, however, that in proportion to the weight of the car, the live force of the fly-wheel did not materially interfere with the steering. The motor rested on iron cross-members to which it was bolted. On these cross-members was also fastened on one side a carburettor, and on the other side the cooling tank; the dynamo for ignition purposes being hung below the frame on the front part. The steering

arrangements then used were similar to those of the present day but, of course, much cruder.

Herr Benz took out his first patent in January, 1888. The differential was only fitted with a one-speed gear, but it was soon obvious that if the car was to be used on other than the flat roads around Mannheim, a second and lower speed was necessary to enable the car to ascend gradients, and even then only slowly. The power of the engine was insufficient as soon as badly kept roads were met, and the speed of the car at its best did not give entire satisfaction. A long period of experiment then followed, until at last a type of car was built which seemed to warrant its use for practical purposes, and these vehicles were then put on the market. Some of the first three-wheeler cars, as described, built by Messrs. Benz and Company, were imported into France in 1887 by Mr. Emile Roger, of Paris. At that time the firm of Messrs. Panhard and Levassor, of Paris, took up the exploitation of the French patents of the Benz two-cycle stationary gas engine, and the presence of Herr Benz was found necessary at their works.

He, therefore, left for Paris in March, 1888, and while there was shown one of his motor-cars at Messrs. Panhard and Levassor's works, and drove it in the presence of M. Levassor in the streets around the works. Doubtless M. Levassor was then unaware of the great future of the motor-car, as he had never previously occupied himself with this type of vehicle, and it was probably this incident that induced the firm to take up the manufacture of motor-cars.

A patented three-wheeler, built by Messrs. Benz and Company, was shown at the Paris Exhibition of 1889, under the name of M. Roger, and was the unique three-wheeled motor-carriage exhibited, but did not attract much attention, as it was not shown running. A greater sensation was made in 1888, when Herr Benz exhibited a motor-car at the Exhibition of Mechanical Industry in Munich. This vehicle could be seen running about the streets of Munich daily, the performances always provoking great curiosity and interest. It was only when the demand for motor-cars increased considerably, that the firm of Messrs. Benz and Company started constructing and turning out large quantities of these new vehicles, but the fact remains that they can justly claim

Rear View of First Benz Car.

to have been among the first, if not the first firm to put a reliable working motor-car on the world's market.

At Kensington Mr. C. L. Drew has held an inquest concerning the death of a man run down by a motor-car. The Coroner said that drivers, cabmen, and others thought that they had done all that was necessary to avoid an accident when they had shouted, but the road was public property, and it was the duty of drivers to pull up as well as shout.

ACCESSORIES FOR TOURING.

The Jones Speedometer.

Factory organisation and a greatly increased output have enabled substantial reductions to be made on two of the Jones speedometers, Models 20 and 21. We illustrate the former model in Fig. 1. It will be noticed that, besides indicating speeds up to a maximum of fifty miles per hour, this instrument also gives a mileage reading up to 10,000 miles, and repeats. There is also a trip mileage indication by means of the Veeder odometer, this trip section, of course, being

Fig. 1.

capable of resetting at any time. Several important innovations in the way of bevel drive at the gear-end in place of the bent shafting are introduced in these new instruments, and, in fact, such improvements as eight years' experience in the manufacture of speedometers for motor-cars advised are embodied in all these devices, for which Messrs. Markt and Co. are agents.

The "Durandal" Non-Skid.

The "Durandal" non-skid which Messrs. STUART, MORRISON AND Co., of 199, Piccadilly, London, brought to the notice of motorists, have won much favour amongst practical motorists. In our issue of April 20th last year we illustrated this type of band, which can be fitted to worn covers as well as to new ones. The feature of the device is the presence of metal clips on the edge of the band. These are inserted in the rim at equal distances from each other, and the tyre is then inflated in the ordinary way. Lately we heard of the owner of a car who had been dissuaded from adopting the "Durandal" non-skid for some time, it being alleged that there was a difficulty in getting the covers on. But when, at length, he adopted this type he found that the whole secret of the effective use was in keeping up pressure in the tyres, so that the clips could be maintained in position. Bearing that necessity in mind, he had worn out two treads on a cover which was apparently as good as ever after such a lengthened experience. The excellent construction of the "Durandal" device secures effective service where care is taken to maintain the pressure of the tyre, as should always be done.

"O. S." Speedometer.

The neat style of speedometer shown in Fig. 2 is the "O. S.," which, having attained distinction in the trials of the Automobile Club of France, is now winning popularity in this country under the ægis of Messrs. W. SEARLE AND Co., 33, Glasshouse Street, London, W. The reduction of the wear of the few working parts to a minimum is a distinctive feature of the device, while the fact that for fast vehicles the transmission does not revolve any faster than in the case of slow cars is a point worth consideration. The main factor in the "O. S." speedometer is the permanent magnetic system, which obviates the use of gear wheels or friction drive. The speed of the car is instantaneously indicated, the needle always coming to a dead stop. The "O. S." speedometer can be fitted correctly to cars of any height or type, and is supplied at a price which should materially assist to its use on motor-cars generally. Messrs. W. Searle and Co. are also the agents for the "Fulmen" Accumulators and other well-known specialties.

Fig. 2.

Brooks' Specialities.

In connection with spring touring, Messrs. J. B. Brooks' cases for Thermos flasks, sandwich boxes, luncheon and tea equipment, and

the like are of interest, these having a most compact disposition of fittings. Mention may also be made of their puncture-proof non-skid tyres and bands. The non-skid tread is a combination of the suppleness of rubber with the durability of leather; the studs are rigidly secured in a way that should be appreciated by those who have had trouble with such devices coming apart in other makes. They consist of a cupped rivet carrying an inset head of dead-hard steel of a uniform hardness throughout, and giving a notable wearing surface. In connection with these the firm issue a series of suggestions for the treatment of non-skid tyres which will be of general interest.

Useful Novelties.

Their showroom at 20, Store Street, Tottenham Court Road, London, W.C., gives a good idea of the ability of Messrs. G. T. RICHES AND Co. to supply motorists with whatever they may require in the way of accessories. Apart from leading specialities such as the C.A.V. accumulators, for which they are special agents, the firm deal in a variety of sundries—the absence of any one of which may have an important bearing on the enjoyment, or otherwise, of the motorist. Thus in springs they have a great assortment of various sizes, and those who own cars of somewhat early date will be able to find all they require in that way. Just now a speciality is being made of copper wire put up

Fig. 3.

in rolls of 16, 22, and 24 gauge, such as are shown in Fig. 3. In the accessories that make for the convenience of the covered car are a full range of novelties, while horns, lamps, &c., form an important section of a business that comprehends all the departments of automobile equipments.

"Ragosoil" Lubricants.

Having had many years' experience with lubricating problems, Messrs. Ragosine and Co., Ltd., of 7, Idol Lane, Eastcheap, London, E.C., bring their motor-car lubricants before the notice of motorists with much confidence. The "Ragosoil" specialities cannot corrode or gum, and give a minimum of carbonisation even at high temperatures. They are prepared in several grades for forced lubrication, gear cases, &c., while a graphite lubricating grease has special merits. The same firm have brought out lubricating oil storage cabinets. These are self-contained and can be kept locked, thus helping to keep the garage clean and tidy. A pump is kept within the cabinet for filling small cans, and all the overflow is automatically returned through a strainer. If necessary, the pump can be taken out and used to fill the cabinet from the barrel or drum.

The "Popular" Speed Indicator.

Recently we referred to the accuracy of the instruments brought out by Messrs. S. SMITH AND SONS, LTD., of 9, The Strand, London, W.C., for the registration of the speed of motor vehicles. Hitherto such devices have been somewhat expensive, but the present season has witnessed the reduction in cost of several notable makes, and the introduction of the "Popular" type shown in Fig. 4. This is made with all the good qualities associated with the firm's well-known devices, and is supplied in brass or nickel. As is apparent, it records the speed of the car up to 50 miles per hour, and has a mileage recorder working up to five figures—altogether a suitable instrument for the modern motorist.

Fig. 4.

The CAR AND GENERAL INSURANCE CORPORATION, LTD., whose head office is at 1, Queen Victoria Street, London, E.C., have many varieties of policy for motorists, the premium varying not only according to the claims they cover, but also as to the horse-power of the cars owned. This arrangement secures equity to the small car owner.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

DISTINGUISHING CARS AT BROOKLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At Brooklands last season I found great difficulty in distinguishing the cars as they raced round the track. Interest and pleasure are lost to a certain extent unless the position of all the competitors can be appreciated at a glance, and with this difficulty in view we have decided to have all our Metallurgique cars painted white when competing at Brooklands during the coming year.

... When an antique motorist like myself finds difficulty in recognising the cars, surely the ordinary public must find it more perplexing still. I suggest, therefore, that the Brooklands rule compelling drivers to wear "colours" (which, by-the-bye, often cannot be seen, and are quite useless at a distance), be carried a stage further and members of the trade be asked to register colours for their cars. The management doubtless appreciated the difficulty when they instituted the carrying of discs with numbers, but these are not of much use at a distance, and to be really easily distinguishable nothing short of colouring the whole car is satisfactory. I am writing Mr. Rodakowski to similar effect asking him to register the Metallurgique colours, as I believe it is just one of those little points that make for success, and anything even remotely

I must put in a word or two for the doctors. Most of our doctors have the telephone and a motor, and I know from personal experience, having called up for neighbours several doctors in urgent cases lately the messengers always say ask him to come in his motor-car and quickly. So if our doctors do as requested, and come quickly to an urgent case to save perhaps a valuable life, and get treated badly by the police, theirs is a poor reward for laying out capital and bringing themselves up to date. I do hope something will be done to stop these little mishaps which are unpleasant to all concerned.—Yours truly,

H. PEWTRESS.

TWO SPEED GEARS FOR STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would esteem it a favour if any of your correspondents who drive Serpollet steam cars could tell me if they have tried fitting a two-speed gear to their excellent machines. I have been recently driving a small 6 h.p. car of that make, and while in the country where one can "keep a swing on her" it is surprising how hills can be climbed, no matter what the load, but once lose your superheat and in a hilly

The Marquis de Mousilly St. Mars at the wheel of his new 40-h.p. Six-Cylinder Napier with which he intends to compete at Brooklands in both the open and private competitors' classes.

likely to assist the track is surely worth trying for the sake of the sport.
—Yours truly,

WARWICK J. WRIGHT.

MOTOR TRAFFIC AND ACCIDENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having read charges against chauffeurs and the accidents leading up to the same, I think it is time that something should be done in the interest of all concerned.

Motor-vehicles are getting more numerous every week, and are likely to increase. Having watched the different traffic on the main roads of Herefordshire for some time I feel certain that if farmers and others sending heavy wagons, carts, and vans (that is, slow traffic) would instruct their drivers to keep along their proper side all the time there would not be these accidents. A farm wagon and two or three horses could start from a place ten or twelve miles from Hereford and keep on their proper side, and fast traffic could pass them as often as possible and make no difference to the wagon and horses. In many cases it is the sudden and excited action of the driver as well as the motor that startles the horses. 2HCA

If, on the other hand, the slow traffic is kept on its way on the proper side, it would not have to pull out of anyone else's way once in several miles. The horses could go on quietly and comfortably, and drivers would be more secure. Motor-cars, bicycles, and traps could pass without interference.

Of course, on the narrow bye-roads we cannot do this. But if all the different people who use the roads would try to use a little common sense there should be no objection to motorists or others going along smartly, so long as the road is clear, as the faster a motor goes by a horse in reason the less danger there is of it being startled.

country it is almost impossible to recover it without stopping, particularly when it occurs, as is most frequent, on a long hill. It appears to me that by the addition of a simple two-speed gear giving a high speed, say 30 deg. in excess of the normal, and a low, say 40 deg., below 'normal, not only would much wear and tear be saved, but by slipping in the low gear on a hill sufficient speed could be given the pumps to maintain both superheat and pressure, and I would be glad of any actual user's experience on this point.

I may add that I have driven petrol cars of all makes and powers for the past seven years, but for general utility, cheapness of upkeep, long life and reliability have never met the equal of a well-made steam car, while the tyre bill alone I should imagine would, power for power, show a saving of quite 25 per cent. Referring once again to the proposed addition of a change-speed gear, it has occurred to me that two sets of chains and sprockets would amply suffice, both sprockets running free and a simple dog clutch locking either to the driving or driven shaft, as the case might be, at will. Of course when one was locked the other would be freed and *vice versa*.—Yours truly,

S. P. CHRISTIE.

AN IGNITION DIFFICULTY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Of late I have been troubled with a very mysterious case of "missing." I have a four-cylinder car fitted with a well-known make of carburettor and accumulator ignition system, in which a separate coil is provided for each cylinder. The contact-maker is of the roller and internal ring type. At times the motor will run perfectly, but just as I am beginning to think my cause of worry has disappeared, a very irregular sort of missing begins, which does not seem to be confined to any one cylinder, but instead affects all of them alike, with the result that the

power of the engine is completely cut off momentarily, and then as suddenly applied, with a most uncomfortable jerk. This temporary cutting off of the power occurs usually three or four times during each spell, after which the motor settles down to its work again, and pulls as well as ever. The missing never seems to occur when the car is standing. I suspected the carburettor for a time, on the theory that some small particle of dirt had in some way got into the float chamber and been drawn up periodically into the jet, but repeated cleaning of the part did not remove the cause of the trouble.—Yours truly,

R. JOHNSTON.

[This trouble might be caused by a fault in the accumulator, as, for example, if the lug that is burned on to the grids is loose it may cause it to make contact badly occasionally, especially when the car is being jolted. Otherwise we should suspect the carburettor or the petrol supply to it. It is possible that the bottom of the tank is foul and that pieces of dirt occasionally choke the supply pipe without reaching the carburettor itself. We suggest a thorough examination of the inside of the petrol tank and the disconnecting and cleaning out of the petrol supply pipe. Another thing that the trouble reads like to us is the presence of water in the fuel. There may be a small quantity of water in the reservoir, which, when the car is standing and the engine running, remains at the bottom, but which when the car is on the road mingles with the spirit by agitation and so finds its way in small doses, but sufficient to cause trouble, to the carburettor.]

METROPOLITAN GARAGES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With the opening of the Franco-British and Earl's Court Exhibitions at hand might I suggest that in your interesting journal

Mr. T. E. Danville, the well-known Comedian, at the wheel of his 35-h.p. Talbot Car.

Mr. Danville uses his car very extensively both for business and pleasure, and states that it has given him the utmost satisfaction.

you should publish a list of garages and stables in these localities where cars could be left during motorists' visits to the shows in question.

To the owner who is able to employ a driver the matter is of little importance, but I feel sure there must be many motorists like myself who always drive their own cars and have experienced the difficulty, when in the City or West End, of finding garages when one wants to have dinner, visit a theatre, or see exhibitions like those I have already mentioned; and I always consider that to use one's car as a means of reaching home is so much more preferable as compared with the general rush for the underground railways, and the subsequent straphanging journey which usually follows.—Yours truly,

GEORGE E. DICKER.

[There are many excellent establishments in and about the West End of London where motor-cars can be garaged; some of these are included in the list of garages in our advertisement pages, where many others might usefully add their announcements.]

A MOTOR-CYCLE QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would you kindly oblige me by stating what gradient my machine would take without pedalling over a distance of about two miles? Particulars are: engine, twin Minerva, 70 by 75; combined weight 390 lb.; gear, 5 to 1; ignition, trembler coil. My reason is that I have increased in weight, and am soon taxed if any pedalling has to be done, yet I do not wish for a two-speed gear; speed is of no moment, but I wish to get out on the hills. As I do not stable my car close at hand, the

motor-cycle would be much handier for casual pleasure trips in leisure time.—Yours truly,

MOOR.

[It is difficult to state with any degree of accuracy what gradient our particular correspondent's machine should climb without pedalling, as so much depends on the state of the roads, wind, &c., but we should say that it should take all ordinary gradients likely to be met on the road, say up to 1 in 8. The simplest method of finding out appears to be to take the machine up the two miles our correspondent speaks of and try it. If it will not complete the distance without pedalling, and since he says speed is no object, he might then try a lower gear by fitting a smaller engine pulley, and if even this is insufficient then we should suggest a twin cylinder 7-8-h.p. Unless there is an ample reserve of power the bicycle might climb the hill on some occasions and not on others, a slight difference in the mixture or the timing of the firing being sufficient.]

HIRING OUT CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is with much interest that I read the letters which appear in this column weekly, and I would like to ask a few questions if you can spare me the space, and hope some of your readers can give me a little advice and so help me.

I am obliged through ill health to give up my trade (which is an indoor one) and live in the open air by the seaside, and of course I want to make a living, as I am not rich enough to live without work. I would like to know:

1. Is it possible to buy a car and do private hiring to make it pay?
2. What is a good make of car, and how much one ought to cost, second-hand?
3. What would be the most important points to observe when buying?
4. What licences are necessary, and what taxes would have to be paid?

I may add I have learnt to drive a petrol car.—Yours truly,

G. G.

USING THE ENGINE AS A BRAKE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall feel obliged if you or any readers of the *M.C.J.* will give me expert opinion on the following point:—In the descent of steep hills does the use of the engine as a brake—by putting the gear into the first, second, or third speeds, and switching-off—do any harm to the engine? My car is a 12-16-h.p. Peugeot.—Yours truly,

J. B. KEITH.

[There is no objection to using the engine as a brake if it is done judiciously; in fact, some of the best cars are now expressly so arranged. In order that the engine shall not be damaged by "racing" it, however, it is not advisable to descend hills with the low gear in action, it is best to use the top speed, although, of course, there is thus less braking effect than when a lower gear is put in. As regards switching off, it is better to shut the throttle than merely to switch off, for in the latter case the engine still draws petrol vapour into the cylinders all the time. This is not only a waste of petrol, but is also a detriment to the cylinders and pistons, as the vapour washes the oil off the surfaces of these parts, and, besides this, a number of unexploded charges are sent into the exhaust box, with the possibility of an explosion blowing it to pieces. As well as throttling the supply of explosive mixture it is advisable to admit pure air in its place, and those interested in the use of engines as brakes should study the methods employed by such firms as Rover, Panhard, and Deasy, in which cases the system adopted enables the motor to be used with much more effect as a brake than in engines that are not specially designed to be utilised in this manner.]

PRIVATE MOTOR HOUSES.—"Hampshire," who enquires for particulars and dimensions of motor houses, is referred to an article on the subject in the *M.C.J.* of February 15th last.

If anyone has found a Smith's milometer or mile-registering instrument in Hampshire, Dorsetshire or Berkshire, Mr. F. W. Shorland, 41, Holborn Viaduct, London, E.C., will be pleased to hear from him.

"MIRACULUM" PUNCTURE STOPPING.—"Sparking Plug" writes:—"If any of your readers have had practical experience with 'Miraculum' I should be very glad to hear if it is a success, and how long they have had it in use. Has it any effect on the rubber or canvas and how long will one charge last? I have a car fitted with single tube Diamond tyres that I thought of putting it in; if it is all that it is claimed it should be just the thing for them."

THE KEMPSTALL TYRE COMPANY OF EUROPE, LTD., write:—"May we solicit your assistance in dispelling the 'suction' theory credited to the Kempshall non-skid tyre? Your readers will not be particularly interested, at the moment, in discussing the 'why and the wherefore,' since in practice the tyre has already established itself a non-skid in the truest sense, but suction necessarily implies decreased speed. For this reason we may be allowed to point out that the Kempshall has proved itself to be particularly speedy, and this fact should, we think, satisfactorily confirm our assertion that suction is not an attribute to its non-skidding qualities."

COMPARATIVE TESTS OF ALCOHOL AND PETROL.

—♦—

THE Technological Branch of the United States Geological Survey, under the direction of Mr. J. A. Helmes, has recently completed an elaborate series of tests on the relative value of petrol and alcohol as producers of power. The tests, over two thousand in number, probably represent the most complete and exact investigation of the kind that has been made and include much original research. Professor R. H. Fernald, engineer in charge of the Gas Producer Section and Professor of Mechanical Engineering in the Case School of Applied Science, Cleveland, O., was in general charge of the tests. Mr. R. M. Strong, formerly connected with the engineering department of Columbia University, had personal supervision of the work and was assisted by a corps of specially trained men. The tests were conducted at the Fuel Testing Plant of the Geological Survey at Norfolk, Va., U.S.A., and show the following results in regard to the comparative fuel consumption of 73 deg. specific gravity petrol and commercial completely-denatured alcohol, per unit of power.

Correspondingly well-designed alcohol and petrol engines, when running under the most advantageous conditions for each, will consume equal volumes of the fuel for which they are designed. This statement is based on the results of many tests made under the most favourable practical conditions that could be obtained for the size and type of engines and fuel used. An average of the minimum fuel consumption values thus obtained gives a like figure of .8 pint per brake horse-power hour for petrol and alcohol. Considering that the heat value of a gallon of the denatured alcohol is only a little over .6 that of a gallon of petrol, this

Eighty per cent. alcohol (alcohol and water), for use in engines of the present types, would have to sell for at least $7\frac{1}{2}$ per cent. less per gallon than the denatured alcohol, in order to compete with it. The minimum consumption values in gallons per brake horse-power hour, for 80 per cent. alcohol, is approximately 17.5 per cent. greater than for the denatured alcohol used, or for petrol. A series of tests made with alcohol of various percentages by volume, ranging from 94 per cent. to 50 per cent., showed that the minimum consumption values, in gallons per brake horse-power hour, increased a little more rapidly than the alcohol decreased in percentage of pure alcohol. That is, the thermal efficiency decreased with the decrease in percentage of pure alcohol. This decrease in thermal efficiency, or increase in consumption referred to for pure alcohol, is, however, comparatively slight from 100 per cent. alcohol down to about 80 per cent. alcohol. Within these limits, it may be neglected in making the calculations necessary to compare the minimum consumption values for tests with different alcohol percentages.

The purer the alcohol is, the greater maximum horse-power of the engine. The reduction in maximum horse-power for 80 per cent. alcohol as compared with that for denatured alcohol used was less than 1 per cent., but the starting and regulating difficulties are appreciably increased.

With suitable compression, mixtures of petrol and alcohol vapours (double carburettors) gave thermal efficiencies ranging between that for petrol (maximum 22.2 per cent.) and that for alcohol (maximum 34.6 per cent.), but in no case were they higher than that for alcohol. The above thermal efficiencies are calculated from the brake horse-power and the low calorific value of the fuel, which for the petrol was 19,100 B.t.u. per lb., and for the denatured alcohol, 10,500 B.t.u. per lb.

Motoring in Mexico.—A View near Mexico City.

(El Automovil en Mexico.)

result of equal fuel consumption by volume for petrol and alcohol engines probably represents the best comparative value that can be obtained for alcohol at the present time, as is also indicated by Continental practice. Though the possibility of obtaining this condition in practice has been thoroughly demonstrated at the U.S. Government fuel-testing plant, it yet remains for the engine manufacturers to make the "equal fuel consumption by volume" a commercial basis of comparison.

The petrol engines that were used in the tests were representative of the standard American stationary engine types rating at 10 to 15-h.p. at speeds of from 250 to 300 revolutions per minute, while the alcohol engines were of similar construction and identical in size with the petrol motors. The air was not pre-heated for the tests, and the engines were equipped with the ordinary types of constant-level suction lift and constant-level pressure spray carburettors. Many special tests with air pre-heated to various temperatures up to 250 deg. Fahr., and tests with special carburettors were made, but no beneficial effects traceable to better carburation were found when the engines were handled under the special test conditions, including constant speed and heat load.

The commercial completely-denatured alcohol referred to is 100 parts ethyl alcohol, plus 10 parts methyl alcohol, plus .5 part benzol, and corresponds very closely to 94 per cent. by volume, or 91 per cent. by weight, grain alcohol. No detrimental effects on the cylinder walls and valves of the engines were found from the use of the denatured alcohol. The lowest consumption values were obtained with the highest compression that it was found practical to use; for the denatured alcohol this ranged from 150 to 180 lbs. per square inch above atmosphere.

As has been previously published, alcohol can be used with more or less satisfaction in stationary and marine petrol engines, and these motors will use from one and one-half to twice as much alcohol as petrol, when operating under the same conditions. The possibilities, however, of altering the ordinary petrol engine as required to obtain the best economies with alcohol are very limited. The amount that the compression can be raised without entirely redesigning the cylinder and valve arrangement is ordinarily not sufficient, nor are the petrol motors usually built heavy enough to stand the maximum explosive pressures, which often reach six and seven hundred lbs. per square inch. With the increase in weight for the same size engine designed to use alcohol instead of petrol, comes an increase in maximum horse-power of a little over 35 per cent., so that its weight per horse-power need not be greater than that of the petrol engine, and probably will be less.

The work was taken up to investigate the characteristic action of fuels used in internal combustion engines with a detailed study of the action of each fuel as governed by the many variable conditions of engine manipulation, design and equipment. These variables were isolated, as far as possible; their separate and combined effects were determined, worked out under practical operating conditions, and led up to the conditions required for minimum fuel consumption. The results show the saving that can be obtained over conditions for maximum consumption, and also establish a definite basis of comparison under conditions most favourable to each fuel. This latter is a point of much commercial interest, and a study of the comparative action of petrol and alcohol may be of great service in solving some of the general internal combustion engine problems where other than liquid fuels are used.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE first meeting of the legal committee which has recently been established as part of the Club's scheme of association was held on Thursday. The committee is composed of ten members, among whom are Col. H. C. L. Holden, R.A., F.R.S., and Messrs. E. Russell Clarke Granville M. Kenyon, W. E. Rowcliffe, G. C. Tjou and Robert Todd.

BROOKLANDS.

WITH the view of securing a large field for the opening race at the next meeting, the Brooklands A.R.C. are instituting a handicap sweepstakes of all cars which were run at the Easter meeting. As the form of all these cars is known to the handicappers a fine race should ensue. Cars will be placed upon their marks before the opening of the meeting, and the tedious wait of a handicap start will thus be avoided.

LANCASHIRE.

THE Lancashire A.C. opens the season to-day (Saturday), when members meet at the Prince of Wales Hotel, Southport, in time for afternoon tea. It has been arranged that some official of the club shall be present at the club-house on a fixed evening each week. Either the assistant secretary or Mr. Birtwistle will be present at the club-rooms every Tuesday evening from 7.45 o'clock, when any information regarding club runs, competitions, &c., will be given.

SOUTHERN.

SUNDAY and Thursday evening runs are a feature of the season's arrangements of the Southern M.C.

The opening run was held on Saturday in Arctic weather, and on Sunday there was a large muster at the Hut, Wisley.

A Contest of the Future.

(Allgemeine Automobil Zeitung.)

YORKSHIRE.

ON Saturday a large company of members of the Yorkshire A.C. travelled through the snow to the Hotel Majestic at Harrogate, where they were entertained to tea by the chairman of the club, Mr. E. H. Hepper, and Mrs. Hepper. The attendance included Messrs. J. T. Hemingway, of Ilkley (20-h.p. Daimler); R. Winn, of Leeds (50-h.p. Ford); A. Kirk, of Pannal (20-h.p. Renault); C. E. Carter, of Batley (16-20-h.p. Humber), and Dr. Crossley, President of the Halifax Automobile Club, on his 16-h.p. Peugeot.

BERKSHIRE.

THE extraordinary weather on Saturday afternoon prevented a large attendance at the annual meeting of the Berkshire A.C., which was held at the Great Western Hotel, Reading. Major E. R. Portal, chairman of the club, presided. Sir Gilbert A. Clayton East, Bart., Major E. E. Hanbury, Mr. Walter Bourke, Mr. S. à Court, Mr. J. F. Hawkins, Dr. W. H. Jessop, Mr. P. B. Burgoyne, Mr. H. Blatch, Mr. C. H. Dodd, Dr. J. Hopkins Walters, Mr. E. Shrapnell Smith (hon. treasurer), and Capt. W. Waring (hon. secretary) were all who mustered.

A difficulty arose at the outset of the meeting as to the completion of a quorum—twelve. Eleven members only being present, Mr. Burgoyne's landaulet was dispatched to bring in Dr. J. Hopkins Walters from his residence in the Bath Road, he having intimated, by telephone, his preparedness to come to complete the quorum, notwithstanding his temporary confinement to the house through indisposition. Before he arrived, however, another member (Mr. Blatch) had entered the room, but, Capt. Waring having gone with the car, the quorum was still

incomplete until thirty-five minutes after the time for which the meeting was called. When Dr. Walters arrived, he was greeted with loud applause. The report and accounts were unanimously adopted. Dr. D. J. Mason (Maidenhead), Mr. E. A. Potter (Wallingford) and Mr. A. D. Selkirk (Windsor) were elected to the general committee.

No notice of motion having been given, a member, by consent, informally drew attention to Rule 25, under which any such notice has to be signed by at least two members. He thought this an inconvenient regulation, as some members might know no others in their district. He also thought that the time had come when a paid secretary should be appointed, in order to relieve Captain Waring of the routine work of the club and in order to develop its programme.

The invitation of Mr. Burgoyne for a meet to be held at his residence, Broadlands, Ascot, on Saturday, July 11th, was accepted, and Capt. Waring offered a private road near Beenham for a hill-climb. The matters of holding a club luncheon or dinner, of arranging a hill-climb, of providing a stand at Henley Regatta, and of the organisation of a 100 mile non-stop run (this to end at a central point, the vehicles taking separate and distinct routes thereto), were referred to the Sports Committee, it being left to the Club Committee to re-constitute that Committee as it chose.

The Chairman said that everybody present must know and appreciate the services that Capt. Waring had rendered to the club, and it was felt that some token of the esteem in which Capt. Waring was held should be conveyed to him as a memento. No more happy occasion could have presented itself than the silver wedding of Capt. and Mrs. Waring. He had great pleasure, in the name of the members, in asking Capt. Waring's acceptance of the small presentation that had been selected. This, by choice of Mrs. Waring, had taken the form of six handsome silver candlesticks, by the Goldsmiths' and Silver-Smiths' Company. Capt. Waring, in acknowledging the presentation, said that he did not know how to put into words all that he felt. He highly appreciated the kindly spirit that had prompted the presentation of this handsome souvenir and memento, and nothing would give him greater pleasure than its being found possible for him to continue as hon. secretary for many years. He would convey to Mrs. Waring and Miss Waring the thoughtful references that had been made to their connection with, and interest in, the club.

ROYAL NORTH OF IRELAND YACHT CLUB.

THIS club, instead of having their usual hill-climbing competition at Cultra for motor-cars, decided to make a change this year and hold reliability trials at Easter. Although some seventy cars are owned by members of the club only eleven started, but nevertheless the trials were most enjoyable and successful. The first day's run was via Antrim to Lough Swilly Hotel, Buncrana, a distance of eighty-seven miles, and all the cars got through safely, although the steep climb of about 1,000 feet over the Sperrin Mountains severely tried the cooling capacity of the radiators. On Saturday evening a most enjoyable smoking concert was held. A curious accident happened during this run. A rooster trying to fly across the road in front of one of the cars miscalculated the speed of the car, struck the glass screen and went right through it, landing on the footboard. Fortunately none of the passengers were hurt. At 10.30 on the Monday morning the cars started for Enniskillen or Rosslare Hotel, near Enniskillen, whichever the owners elected to stay at, the route being via Stranorlar, Barnmore Gap and Ballyshannon. Distance ninety-eight miles. The run home, ninety miles, on Tuesday was via Clones, and was the best of all as regards weather and roads, the latter, especially in county Armagh, in beautiful order, are a great credit to the surveyor. At the start each car received 300 marks and one mark was deducted for each minute lost unless the stop was for tyre troubles, filling up with petrol, oil, &c., or for the convenience of passengers. Five cars made non-stop runs, and the others had only minor troubles. The marks gained are as follows:—

| H.p. | Make of Car. | Owner. | Marks. |
|-------|--------------|--------------------------|----------|
| 20 | Talbot | W. J. Pratten (non-stop) | 300 |
| 18-20 | Clement | John Lepper (non-stop) | 300 |
| 16-20 | Calthorpe | W. Hume (non-stop) | 300 |
| 14-22 | Germain | R. E. Workman (non-stop) | 300 |
| 10-12 | Humber | J. W. Lemon (non-stop) | 300 |
| 10 | Chambers | W. C. F. Redmond | 299 |
| 20-32 | Darraeq | F. Workman | 296 |
| 14-16 | Minerva | A. Inglis | 295 |
| 14-16 | Argyll | J. C. Nixon | 290 |
| 24-30 | Nordenfelt | J. Carson | 224 |
| 12-16 | Chambers | J. S. Davidson | retired. |

Mr. John Carson presented two prizes for a guessing competition as to how the cars would be placed in order of merit at the finish. The ladies' prize was won by Miss Workman and the gentlemen's by Mr. W. J. Pratten.

MAJOR C. G. BRODIE, Fernhill, Wootton, is the secretary of the Isle of Wight Motorists' Association.

THE British Motor Boat Club has presented a cup to the Essex Motor Boat Club. In accordance with the club's policy of encouraging

International racing, they have given a cup to the Motor Yacht Club of Belgium.

THE Surrey Motor-cycle Club has held a very successful first annual dinner.

SEVENTEEN members took part in the opening run of the season of the Ayr and District Motor Club to Largs, via Kilwinning and Ardrossan, a distance of thirty-three miles. The party set out from Burns Statue Square headed by the captain, Mr. John Hourston.

THE opening meet of the Kent A.C. took place on Saturday at the Queen's Hotel, Hawkhurst. Owing to the wintry weather the attendance was not large; the following, however, were present:—Mr. and Mrs. Gardner, Mr. and Mrs. Teichman, Mr. Martingell, Mr. Owen Firth, the hon. secretary and Mrs. Kenyon, and Mr. J. Darwen.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING THE LEGAL LIMIT.

Danny Maher, the jockey, and Francis More, chauffeur, Nottingham, have been fined at Newark for driving motor-cars at excessive speeds—estimated by a police-constable at thirty-five miles an hour. Mr. Lucas, solicitor, represented both defendants, and on their behalf pleaded guilty. He said it was a most difficult thing for a driver to estimate the speed at which he was driving. The Chairman (Mr. W. E. Denison): Mr. Maher ought to be a good judge of speed. In each case a penalty of 10s. and costs was imposed.

In three hours the Woking magistrates have just imposed fines amounting to £78 10s. on twenty-three motorists. Of these cases five were for driving to the common danger; fourteen for exceeding the 20-mile limit, or for exceeding the 12-mile limit; two for driving without a licence; and one for driving an unregistered car.

Three motorists were fined £5, £3, and £2 at the Epsom Petty Sessions on Monday for exceeding the speed limit.

On Saturday ten motorists were fined by the Chichester county magistrates for exceeding the legal limit at Westhampnett; four others were similarly convicted at the Horsham Petty Sessions.

DANGEROUS DRIVING.

Rudolf Henkel appeared at Cardiff to answer a summons, issued at the instance of Mr. R. W. Hunter, for having unlawfully driven a motor-car in Queen Street, to the danger of the public. In opening the case, Mr. Shackel said Mr. Hunter was an engineer at Cardiff, and had taken up the case on behalf of motorists (as a member of the South Wales and Monmouthshire A.C. On the evening of March 21st Mr. Hunter was crossing from Queen Street in Duke Street, which thoroughfares were crowded on the occasion. Defendant drove along North Road, and when he was ten yards off Mr. Hunter stopped. There was a crowd at the corner, and the car swerving into Queen Street, and without any attempt to pull up, hit Mrs. Hunter, who was with witness. The Bench inflicted a fine of 10s. and costs.

Robert Budgen, of Brighton, has, at Lewes, been fined £2 and 6s. costs for failing to produce his motor licence for the purposes of endorsement.

At the Kingston-on-Thames County Police Court, on the 23rd ult., £104 in fines was imposed on motorists for having exceeded the 20 miles an hour speed limit on the main road between Kingston and Cobham.

Two motorists have been fined at Eastbourne for driving to the public danger. Fines of £10 and £5 were inflicted.

LICENCE SUSPENDED.

Lord Vernon, of Poynton Towers, Cheshire, was fined £20 and costs at Leicester, on Saturday, for driving a motor-car through Oadby at the rate of twenty-five miles an hour. He had been previously convicted, and his licence was suspended for twelve months.

"IMMACULATE ROBERT."

Mr. Plowden was engaged practically the whole afternoon, at Marylebone, on the 23rd ult., hearing summonses against motor-car drivers for exceeding the speed limit. At the end of the time he said he waited day by day, hoping, out of mere curiosity, to hear some defence which could be accepted as substantial, and as breaking down the evidence of the police, but, in the whole of his experience, he only remembered one instance in which he was able to say, without hesitation, that the police had made a mistake.

FIXED OR SWINGING NUMBER PLATE?

Much time was taken up at the Raglan Police Court on Saturday in hearing a summons against Sidney Howells, a chauffeur, in the employ of Mrs. Philip Morel, Penarth House, Penarth, for driving a motor-car without having the identification plate so fixed that every letter or figure was easily distinguishable. P.S. Jones, an officer who is getting much public notice because of the large number of motor cases in which he is instrumental in bringing about prosecutions, said that on the afternoon of March 31st he was near Raglan village, and saw a motor-car coming from the direction of Monmouth. As the number plate, L 836, could not be made out, he stopped the car, and found the number plate was hanging quite loosely. Mr. F. C. Shackel, solicitor, Cardiff, who defended, asked witness if he had seen a number of cars with swinging plates. The reply was in the affirmative, and that this was the first time he had stopped them. The defendant was sworn, and said he had driven a motor-car for nine years all over England and Wales, and had never been "pulled up" before. The sergeant had to kick the plate in order to move it. He added, "I have

a reputation for being a careful driver." The Chairman (Mr. Raglan T. H. Somerset) said they could not convict in such a case. At the same time the magistrates thought the County Council should issue a bye-law to the effect that the plates should be properly fixed. The case was dismissed, but the defendant was ordered to pay costs.

THE TRADERS' REGISTER.

A curious case has occupied the attention of the Guildford borough magistrates, when Mr. E. A. Humphreys, of the Falcon Motor Works, Guildford, appeared to a summons which alleged that he being a manufacturer or dealer in motor-cars failed to keep a record of the distinguishing number placed on a motor-car to which a general identification mark had been assigned, and the name and address of the person driving such car on March 21st, contrary to the regulations of the Local Government Board. Superintendent Marks stated that on the morning of the day in question he saw the defendant driving a motor-car at Woking. It bore a manufacturer's mark, Pt AG. He asked a constable at the Guildford County Police Station by telephone to inspect the register. Cross-examined by Mr. Triggs Turner: He was present at the Woking Court on the previous Saturday and gave evidence against defendant to the effect that he used a motor-car which was not registered.

After hearing counsel for Mr. Humphreys the Bench dismissed the case and refused to state a case in view of an appeal.

MOTOR-CAR RACING IN THE UNITED STATES.

AN important international motor-car race for what is known as the Briarcliffe Trophy was held on a thirty mile circuit in the neighbourhood of New York on Friday, the 24th ult. Twenty-two entries were received, these including two 60-h.p. Fiats, a 50-h.p. Bianchi, a 30-h.p. Maja, three 50-h.p. Isotta Fraschini, two 50-h.p. Renaults, a 50-h.p. Panhard, a 50-h.p. Benz, and eleven cars of American construction,

The 36-h.p. and 38-h.p. Humber Cars which Competed at Brooklands at Easter. [Campbell-Gray.]

including Stearns, Thomas, Lozier, Hol-Tap, Allen-Kingston, Simplex and Apperson. The course, which was an extremely dangerous one abounding in sharp narrow turns, had to be covered eight times, giving a total distance of roundly 240 miles. In spite of the early hour at which the race commenced (5 a.m.) a large crowd, estimated at over 150,000, gathered along the course. Although the spectators eventually got on the track, hindering the racers, there were fewer accidents, however, than might have been expected under the circumstances. During the first round one of the American cars, a Simplex, at one of the turnings struck a stone post and turned a complete somersault. Watson, the driver, was severely injured. Two cars collided with each other and were put out of the race through the damage done to them. The occupants were, however, only slightly hurt. The Allen-Kingston car ran into a ditch, while the Maja retired owing to a broken road wheel.

At the end of the fourth round Strang (Isotta-Fraschini) was leading, with Poole, on a sister car, running second. The latter, however, lost several minutes in the seventh round, and Strang, closely followed by Cedrino on a Fiat, maintained his lead and proved the winner.

The result was as follows:

1. Strang (Isotta-Fraschini), 5 h. 14 m. 13 s.
2. Cedrino (Fiat), 5 h. 21 m. 5 s.
3. Vaughan (Stearns), 5 h. 28 m. 29 s.
4. Lytle (Apperson), 5 h. 39 m. 15 s.
4. Sartori (Bianchi), 5 h. 53 m. 45 s.

The winner's average speed works out at just over forty-six miles per hour. The fastest lap, 37 min. 16 sec., was made by Cedrino.

It is reported that Strang has been engaged to drive the Thomas car—the sole American competitor—in the A.C.F. Grand Prix race.

ROAD REPORTS.

ILFORD.—The measured furlong in the High Road, Ilford, is being frequently worked by the police.

READING.—A trap has been established on the Bath road, Reading. Several motorists from the London district have already been caught therein.

HORSHAM.—At the last meeting of the Horsham Rural Parish Council it was decided "That in view of the great and increasing danger to the public and the unbearable nuisance of the dust arising from motor-cars, this Council again urges the West Sussex County Council to take immediate steps to restrict the speed of all motor-cars to eight miles an hour when passing through the villages of Roffey, Broadbridge Heath, and Southwater."

LUTON.—The Hitchin Road is at present under repair between Guildford Street and Midland Road. An alternative route for through traffic is High Town Road, Midland Road, Guildford Street, Cheapside, and John Street, and for local traffic Midland Road, Guildford Street, Cheapside, and John Street. Special caution should be exercised on the

ELTHAM.—The motor trap in the Eltham Road, Eltham, is in frequent operation, the police having secured several hauls on recent occasions.

GLOSSOP.—The Council of the borough of Glossop have made application to the Local Government Board for a ten mile speed limit, objections to which should be sent to Whitehall before the 12th inst.

THE "FOUR-INCH" RACE.

THE supplementary regulations in connection with the International "four-inch" race for the Tourist Trophy have settled the distance as about 350 miles. The minimum weight will be 1,600 lbs., and the use of auxiliaries to combustion such as oxygen is prohibited. On the course there will be two depots under the official supervision of the club from which competing vehicles may be replenished with fuel, oil and water, and from which spare parts, &c., may be obtained. Entries are now being received at a fee of £35 per car. On July 1st the fee will be increased to £45 and the list finally close on August 1st. In the event of the race being held in the Isle of Man, as is most probable, practis-

The Old and New Methods of Transport in Patagonia.

In far-away Patagonia an Argyll motor-lorry is being used to expedite the transport of wool from the Estancia, or ranch, to the coast. The upper one of the accompanying illustrations shows the customary method of transporting merchandise by oxen trains in the country. As an example of the superiority of motor traction, it may be noted that the automobile can do in twelve hours what it takes three teams of oxen four days to accomplish.

downward journey in London Road, and at the junction of Midland Road and Old Bedford Road; also at the junction of Castle Street and Windsor Street. It is the intention of the Corporation during the summer to cover the more important roads in the centre of the town with tarred slag.

OXFORD.—With the view of minimizing the dust nuisance occasioned by increased motor traffic the experiment of treating the principal roads of Oxford with tar is to be extended.

THE SCOTTISH BORDERS.—For the past few days the police have been busy in trapping a number of motorists for alleged excessive speed while travelling between England and Scotland. Near to Gretna a measured mile has been frequently watched.

SIDCUP.—Much interest is being taken in the district in the trial of Hahnite as a dust preventive that is now taking place on the main road at Sidcup.

LANARK.—The Lower Ward Committee of the Lanark County Council has decided to approach the authorities for the purpose of securing the limitation of the speed of motor vehicles to ten miles per hour when passing through populous places.

ing over the course will only be allowed on the fourteen days prior to the week of the race, and then only from daylight until 7.30 a.m.

Mr. S. F. Edge has made the first entry for the speed race of next October, to be held in the Isle of Man. The car is a Napier of 25.6-h.p. Mr. E. A. Rosenheim has entered two New Arrol-Johnston cars.

WE learn from Messrs. Martins, Bow Bridge, E., that at the recent Cordingley Show they sold two motor-lorries, one being to the Duke of Manchester, and have, since the exhibition, received a large number of inquiries "which we otherwise would not have obtained had we not exhibited."

It is only a short time ago since Mr. E. M. C. Instone ascended the Guadarrama Pass on his 45-h.p. Daimler, establishing a record, which caused great excitement in motoring circles in Spain. Shortly after the Daimler Company opened depots at Madrid and San Sebastian, and their enterprises are meeting with well-deserved success. Amongst recent purchasers are Exmo El Marques de Villamarta, Reyes Catolicos, Seville, who has ordered a 42-h.p. Kenilworth phaeton car.

PRACTICAL POINTS FOR MOTORISTS.

THE following "practical points" extracted from the useful instruction book lately issued by the Star Engineering Company will be found worthy of observation not only by users of Star cars but by motorists generally:—

Never neglect to thoroughly oil a bearing immediately after it has been cleaned with petrol or paraffin. Neglecting to do this will probably result in a seizure.

Because you do not want your side brakes often, do not neglect them. When you do want them, it may be badly.

When starting the engine, never push handle down, but always pull up, because the hand is then more easily released in the event of a back-fire.

Never run your tyres after baring the canvas; it is economy to have them retreaded at once.

Do not ride a deflated tyre, because it will cut between the rim and the ground.

Do not leave your car for months in your coachhouse with your tyres taking the weight of the car, but jack up all wheels and partially deflate.

Do not allow water to get at the canvas of your tyre covers, it will cause rot. Remember, all oils and fatty substances are detrimental to tyres, as they act as a solvent.

Bear in mind, driving round sharp corners causes lateral rubbing friction to tyres. Always disconnect clutch, leaving the car to turn by its own impetus.

Occasionally, and especially when in a flinty district, it will pay to go over each tyre and extract small stones. The cuts, if at all deep, should be filled in with stopping.

In the event of a stoppage in the petrol pipe from the tank to float-chamber of the carburettor, the union may be unscrewed and the rubber end of the tyre pump connection pushed over the end. A few sharp strokes of the pump will usually remove any grit or debris in the pipe.

To locate the hole in a punctured carburettor float, place in warm water and note whence the bubbles proceed. The float should then be warmed till all the petrol and moisture is driven out, and a touch of solder applied. The solder should not be used sparingly, but cleaned off after with emery cloth.

Popping in the carburettor indicates a weak mixture; that is, not enough petrol for the amount of air introduced into the vaporising chamber. Explosions in the silencer indicate that the cylinders are firing irregularly and the unfired charges pass through the exhaust pipe into the silencer, being ignited there by the heat of the next explosion. A weak battery is sometimes also the cause of this.

Always include some copper wire in the kit, as it comes in handy for many purposes.

Grinding of the carburettor needle valve should be done sparingly, or flooding will result.

Always keep a good supply of sand near your petrol store, so that it can be readily used in case of fire; nothing is so quick in smothering flames. Water only helps to spread them when caused by petrol. Always securely replace screw tops of petrol tins after removing petrol, because of the complete explosive mixture left in the tin. Petrol vapour is heavier than air and its tendency is to sink low on the floor, therefore beware especially of any naked light in the pit of the motor house.

MOTOR-CAR v. DOG.

JUDGE SCULLY has had before him at the Brighton County Court a case in which Dora Glennie, of Western Road, Brighton, sued the Steam Motor-Car Syndicate, Ltd., of Hythe Road, Willeaden Junction, for £50, for damages for injuries to a Great Dane dog on December 30th, 1907, caused by alleged negligent driving of a motor-car. Miss Glennie said the dog won a prize at a show. On the evening of December 30th, shortly after eight o'clock, she was with the dog on the King's Road. The animal was trotting across the road when a motor-car came along and dashed straight into the dog, knocking it down. The animal was seriously injured and had to be placed on a truck and taken to Mr. Charles, the veterinary surgeon, and was afterwards sent to the dogs' hospital at Shooter's Hill, where it stayed until April 15th. For the defence Alfred Westcott, the driver of the car, said on the night in question he was travelling at about sixteen miles an hour, and when opposite the cab-stand opposite the Grand Hotel the dog ran out into the road and bounded in front of the car. Before he had time to do anything the off-side front lamp of the car struck it and knocked it over. It was too sudden for him to do anything to avoid a collision. Clement Ricks, M.R.C.V.S., said he had recently examined the animal and found it in poor condition but nothing radically wrong about it. He thought a month would suffice to put it in as good condition as it was before the accident. He would have valued it at from £30 to £35 before the accident, and he did not think there would be any depreciation in its value in about a month's time. The jury were then addressed by the respective counsel, and retired to consider their verdict, which they gave in favour of plaintiff for £20. His Honour accordingly gave judgment to that effect with costs.

WE are informed that ten winners of races at the Brooklands Easter meeting used Shell motor spirit.

COMPANY NEWS.

BRITISH DIVISIBLE RIM COMPANY.—£100. To acquire and turn to account any inventions connected with detachable or divisible rims or other tyre attachments.

BRITISH TYRE COMPANY.—£30,000. Agreements (1) with J. O'Brien and Annie G. O'Brien for acquisition of certain inventions, and (2) with Kempshall Tyre Company of Europe, Ltd. None. First directors: Messrs. E. Kempshall, J. J. Bowen, and C. Wilson (all directors of Kempshall Tyre Company of Europe, Ltd.)

A. PELLANT, LTD.—This company has been registered with a capital of £12,000 to adopt an agreement with A. Pellant, to acquire the business carried on at 74, Shaftesbury Avenue, 4-5, Dansey Yard, Shaftesbury Avenue, and 28-30, Little Orford Street, Chelsea, as "A. Pellant," and to carry on the business of automobile agents, &c. Registered office: 74, Shaftesbury Avenue, W.C.

THE LONDON ELECTROBUS COMPANY, LTD., have invited subscriptions to an issue of 240,000 ordinary shares of £1 each and 12,000 deferred shares of 5s. each. The capital of the company is £305,000, divided into 300,000 ordinary shares of £1 each and 20,000 deferred shares of 5s. each. The company was formed to run electric omnibuses in the Metropolis, and after exhaustive experiments and nine months' actual service with a small fleet of electrobuses, the directors call attention to the results as proving the public and commercial value and success of the enterprise. The subscription list closed on Thursday.

ATLAS RESILIENT ROAD WHEELS.—£100. As title. 37, Cross Street, Manchester.

ALBERT MOTOR COMPANY.—£3,000. To take over business carried on by F. K. E. Hussey, as Albert Motor Works, at South Street, Gloucester.

Mr. Arthur Hoare, of the Bombay Motor-Car Company, passing through the Kashmir Gate of Delhi on his 30-h.p. Daimler.

The Kashmir Gate of Delhi is one of the most famous in India. In the year 1857, when all the Europeans in Delhi had been massacred, it was through this gate that the relief party determined to make an entrance, and, after many hardships and privations, they succeeded in blowing up the obstruction and getting through.

ARGYLLS, HULL.—£5,000. To adopt an agreement with Argyll Motors, Ltd., for appointment of this company as selling agents for said company in and near Hull. Jameson Chambers, Jameson Street, Hull.

LIVERPOOL AND MANCHESTER DISTRICT MOTOR CAB COMPANY.—£100,000. Agreement with J. A. Lawton and W. Lawton Goodman (trading as J. A. Lawton and Co.), Liverpool Motor Cab Company, Ltd., and Manchester Motor Cab Company, Ltd. First directors: Messrs. A. McGowan, W. Nicholls, P. Jones, C. Ellam, R. R. Gwynne, J. McWilliam, and W. Bailey.

LYNTON WHEEL AND TYRE SYNDICATE.—£8,000 (£100). To acquire business carried on by R. T. Smith, at Warrington and Earlestown, as Lynton Wheel and Tyre Company. 5, Egypt Street, Warrington.

TYREHOOD.—£2,000. To acquire business carried on by H. F. Willis, C. C. Hurford, and F. C. R. Parry at King's Cross as Tyrehood, Ltd., and to carry on business of manufacturers of and dealers in tyres, &c. 1-2, Argyle Street, King's Cross, N.

THE latest embodiment of the enterprise and ingenuity of the executive at the Panhard-Levassor Works, Acton Vale, W., takes the form of a particularly neat little silverite lighting-up table, readily attachable to the dashboard of any car. Its material and the colouring of the lettering are such that its figures are clearly legible up to the last peep of daylight, while the dimensions are only 3½ in. by 2 in. We understand that while the tablet will be fitted gratis to cars of whatever make passing through their works for treatment, it will also be sent post free to any motorist sending a shilling and mentioning the M.C.J.

FORTHCOMING EVENTS.

MAY.

- 2nd (Sat.).—Impromptu pace judging competition of the Sheffield A.C. at Ollerton.
Lancashire A.C.'s opening run to Kirkby Lonsdale.
Motor Cycling Club's hill climb.
- 6th (W.).—Dorset A.C. Gymkhana at Sherborne.
- 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
Penalty speed judging contest of the Southern M.C. at the "Chequers," Horley.
Brooklands A.R.C. meet.
Cheshire A.C. meet at Pentrevoelas.
Manchester A.C. reliability run.
- 13th. (W.).—Incorporated Institution of Automobile Engineers—Discussion on the effect of motors on roads.
- 14th (Th.).—Mr. G. H. Baillie at the R.A.C. on Petrol and Petrol Tests.
- 16th (Sat.).—Fifty miles Consumption Trial of the Hertfordshire C.A.C.
Liverpool A.C.'s opening meet of the season.
Auto Cycle Union hill climb.
Liverpool A.C. first meet of the season.
New Forest A.C. club run to Brockenhurst.
- 21st (Th.)—25th.—Reliability Trial of the Irish A.C.
- 18th (Sun.).—Targa Florio Race.
- 23rd (Sat.).—Clipstone race meeting of the Notts A.C.
Meeting of the Yorkshire A.C. at Helmsley.
Meet of the Motor Union at Lincoln.
Motor Cycling Club—Albert Brown Challenge Cup for cars.
- 25th (M.).—Industrial Vehicle Competition of the A.C. de France.
- 26th (Tu.).—Motor Gymkhana on the links of the Ross Golf Club at Alton Court—Mr. T. H. Coombes, "Montrose," Ross, is the hon. secretary of the event.
- 28th (Th.).—Visit of the Aero Club to Aldershot.
- 30th (Sat.).—Meet of the Herts C.A.C. at Hatfield Park.
Devon and Cornwall A.C. hill climb at Moorshop, Tavistock.
Lancashire A.C. speed judging contest.
- 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.
Penalty run of the Southern M.C. to Goring.

JUNE.

- International Aeronautical Federation conference in London.
- 5th—6th.—London—Edinburgh twenty-four hours' run of the Motor Cycling Club.
- 6th (Sat.).—Brooklands A.R.C.
- 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
Start of the International Touring Car Trial of the R.A.C. Brooklands A.R.C.
- 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
- 11th (Th.).—Start of the International Touring Car Trial of the R.A.C.
- 13th (Sat.).—Hill climb of the Notts A.C. at Oakmoor.
Speed Trials of the Lincs. A.C. at Grimsthorpe.
N. Middlesex A.C. speed judging competition for the Gamage Cup.
- 14th (Sun.).—Mont Cenis hill climb for voiturettes.
- 15th—19th.—Scottish Reliability Trial.
- 17th.—Close of Prince Henry Touring Competition in Germany.
- 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
- 27th (Sat.).—Saltburn beach races.
Buxton meet of the Manchester and Lincolnshire clubs.
Members of the Cheshire A.C. will participate in the Gymkhana of the Manchester A.C.
- 28th. (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
- 6th (M.).—Grand Prix A.C.F. (Voiturette section).
- 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
- 11th (S.).—Provincial meet of the R.A.C. at Hereford.
- 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
- 18th (Sat.).—Annual Gymkhana of the Herts C.A.C. at The Grove, Watford, by permission of the president, the Earl of Clarendon.
Meet of the Liverpool and Cheshire A.C.'s at Delamere.
New Forest and Dorset A.C.'s joint hill climb.
- 20th—30th.—A.C. of Belgium—Circuit des Ardennes and the Liederkerke Cup race.
- 25th (Sat.).—Petrol Consumption Tests of the Motor Cycling Club.
Annual Open Hill Climb of the Midland A.C. at Shelsley Walsh.
- 26th (Sun.).—Southend M.C. run to Coach and Horses, Quendon.

THE HUMOUR OF JUSTICE DARLING.

IN the King's Bench Division of the High Court of Justice, on Tuesday, Justice Darling heard a case which had reference to a collision between two automobiles. The learned judge questioned one of the drivers very closely about his licence. He asked if the man got a licence before he drove or after, and the witness replied that one did not drive before one got a licence, or at least one was not supposed to.—(Laughter.)

The Judge.—Did you get a licence before you drove?—Yes. I had only had inside experience as a motor-car mechanic.

Do you mean that you can get a licence not knowing how to drive, and then career all round the streets as you like?—(Laughter.)—Yes.

I only want to know, because I sometimes walk in the streets.—(Laughter.)

Mr. McCall, K.C.—The wisdom of Parliament appears to have agreed that even the celebrated Ben Battle could have taken out a licence to drive a motor-car.—(Laughter.)

The Judge.—Apparently that is so.—(Renewed laughter.)

INTERNATIONAL RELIABILITY TRIAL.

THE following entries at double fees have been received for the Scottish reliability section of the above:—Class I., 10-h.p. Adam; Class IV., 24-h.p. Junior.

AUTOMOBILE ACCIDENTS.

EARLY on Saturday morning, John Bryan, an ex-soldier, fifty-seven years of age, living at Aldershot, was knocked down by a motor-car on a part of the road between Guildford and Ripley, near the latter place. At 5.15 a.m. he was found by the driver of one of Messrs. Maple's motor-vans lying by the side of the road and was conveyed to the Guildford hospital, where he died the same afternoon without recovering consciousness. At the spot where the man was found the police discovered marks on the bank near by as if a motor-car had run into it, and close at hand were portions of a broken motor-lamp.

THE Surrey police on Tuesday arrested Arthur Metson, chauffeur, of Camera Square, Beaufort Street, Chelsea, on suspicion of being concerned in the death of John Bryan. He was charged at Woking, on Tuesday morning, with manslaughter and remanded.

BUSINESS NEWS.

IN connection with the Sizaire-Naudin race at Brooklands on the 18th ult., it is interesting to learn the cars which finished first and second were those which had done the most running, and were, in fact, the oldest vehicles in the ten competing. Mr. Scantlebury's car—which won the event—has travelled over 12,000 miles, and Mr. Millard's—which finished second—has covered over 10,000 miles. Considering the conditions under which the race was run—namely, against a strong head wind on one side of the track—the average speed of the winner from the standing start of over thirty-nine miles an hour was remarkably good.

"MOTOR TOURING IN FOUR SPASMS" is the title of an illustrated brochure issued to depict the delights of motor touring on a "Standard" car. Messrs. Friswell, of Albany Street, London, N.W., will be pleased to send a copy to applicants.

SIR GEORGE ABERCROMBIE has had the body of his Fiat 60-h.p. six-cylinder car made detachable by the Windham Detachable Body Company.

FOR the convenience of their clients in the west and south-west districts, Messrs. Markham and France, consulting motor engineers, have now opened consulting rooms at 39, Westbourne Gardens, W., and at 50, Ritherdon Road, S.W., in addition to their central office at 143, Strand, W.C., and appointments can be made at either of these new addresses.

SECTION 27 of the Patents and Design Act, 1907, gives power to the Comptroller, on the application of any person within the time therein specified, to revoke any patent on the ground that the patented article or process is manufactured or carried on exclusively or mainly outside the United Kingdom. In this connection Turner's Motor Manufacturing Company, Ltd., Wolverhampton, inform us that they are prepared to undertake the manufacture of any patented article now made abroad, within the radius of their business, which includes the manufacture of workmen's time registers, ticket punches, time stamps, automatic machines, clockwork motors, duplicators, registering machines, &c.

MESSRS. STERNBERG AND EASON inform us that they have relinquished the British agency for the Buick car, and have consequently decided to dissolve partnership.

WE hear from the Victoria Carriage Works, Long Acre, W., agents for the Léon Bollée car, that one of their clients, Mr. E. F. Millar, has just accomplished the feat of piloting his car—a 24-30-h.p.—to the summit of Mount Koociusko, the highest peak of the Australian Alps. This is the first time this peak has been ascended by a car, and it speaks well of the climbing powers of the Léon Bollée.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, MAY 9, 1908.

[No. 479.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

MANY suggestions have been made with a view of popularising the motor track at Brooklands, and various proposals to facilitate the identification of particular cars when running at a high speed, as well as to interest the outside public, have been before the committee. Recently the suggestion was advocated that the vehicles should be coloured with some distinctive hue, and now, in order to attract public attention to the events, a well-known motorist has suggested the registration of names for the cars taking part in races, much in the same way that Sir J. H. A. Macdonald proposed christening vehicles with distinctive names instead of numbering them when the present Act was yet a Bill. This "naming of cars" suggestion has been adopted by the Brooklands Club, as will be seen from information published in our Club News on another page.

Unjustified Danger Signs.

ENTERING Dorchester from the Bournemouth road, we recently came upon two red triangle signs, one at each end of a circular drive to the house of some local magnate. The road on which they stand is a straight one, and there are no cross roads or lanes in the vicinity. Their only use is apparently to enable the resident of this favoured spot to drive out whenever he wishes regardless of any other traffic that may be about. The location is certainly absurd, and such as was never contemplated by the Motor Car Act. Both in Scotland and England there has been an unauthorised use of these triangle signs in several places, and we would suggest that in the instance mentioned the Motor Union should take steps to have the same removed on the ground that there is no justification for their erection. There is a similar case between Hursley and Winchester, and doubtless some of our readers may know of others.

Our City Streets.

AMONG the familiar features of the road that seem to be departing from London streets is the "decent respectable mud" with which we were wont to be bespattered in the Victoria Era. On such a day as Tuesday in London the dirty roadways were covered with a thick mud, in which shiny slimy patches revealed the presence of an oily constituent. To fall in such an instance means something more than personal inconvenience. That these patches are not isolated matters is evident from a statement to the Lord Mayor, at the Mansion House, by Mr. T. G. Vickery, the Assistant City Solicitor. In consequence of the numerous complaints received by the City Police respecting the dropping of oil and grease from motor vehicles in the streets, the Chief Commissioner caused special observations to be made, with the result that during the week ending April 19th 172 cases of this offence were reported, while for the week ending April 26 there were 382 cases, all of which were bad ones. The dropping of this thick black grease on the roadways was a danger to horse and pedestrian traffic, and was

disagreeable in other ways, while it also rendered the streets more difficult to cleanse. The chief offenders were the omnibus companies, and it was simply carelessness on the part of the drivers, or a case of bad construction of the tray which received the leakings of the grease and oil. In inflicting fines on the drivers, the Lord Mayor held that the companies were responsible, and should indemnify the drivers against fines for such an offence.

Good Club Work.

MANY of the provincial clubs are now opening their season, and although the weather has been treacherous enough to dispel many hopes of an early return to the road, several are now in full swing. The advantages of united action in connection with automobile matters are obvious, and those unattached motorists who have not yet become associated with their fellow owners of cars should seriously consider whether their duty is not to link themselves in the great chain of organisation that is now comprehending the whole of the kingdom. Useful work, apart from the social aspect of club life, is being done throughout the country, as we propose to show in a series of notes from our local correspondents which we shall publish during the next few weeks.

In East Anglia.

IN East Anglia the clubs have certainly made their influence felt. The Bury and West Suffolk Club has kept in touch with the local road authorities and done much to secure necessary improvements in the state of the roads, while at the time of the Bury St. Edmunds pageant it secured accommodation for upwards of 500 motor-cars during the week. The relations between the local police and the club have been of the most friendly character, the former always bringing cases of reckless driving to the notice of the club in order to prevent a repetition of the offence before taking action. Equally good work has been done by the Essex County A.C., which elected the county surveyor, Mr. P. J. Sheldon, as an hon. member in recognition of assistance rendered on all matters affecting the improvement of roads. Attention is also being given to the subject of delays at level crossings, and arrangements have been made to secure free garage for the cars of members at the appointed repairers for a period not exceeding four hours during business hours.

Good Work in the North.

IN the north the North-Eastern Automobile Association has done good work. Its comprehensive system of local secretaries reaching from Berwick to Darlington has contributed to an efficient organisation which has been able to serve the movement well in that wide area. Legal assistance has been afforded to some members of the association, and warning triangles have been erected by the County Councils of Durham and the North Riding of Yorkshire at the instance of the association. An interesting advantage has been to secure from the North-Eastern Railway Company books of tickets for motor-cars available in connection with the High Level Bridge tolls at

Newcastle, and we feel it would be to the mutual interests of the railway company and the motorists in that district if the period of availability of the tickets could be extended, in which case the facilities would be shared by motorists other than those living in the immediate neighbourhood. We understand that during the present year a hill climb will be organised, and it is probable that suggestions will be made as to the appointment of a road agent at Morpeth and Gateshead during the coming season. In connection with the success of the North-Eastern A.A. the services of Mr. J. E. Hodgkin, the hon. secretary, have been invaluable, whilst the part he took in the endeavour of the provincial clubs to promote a better feeling between the organisations in London is favourably remembered.

Not Stopping after Accidents.

THE number of accidents which have occurred in which motorists are alleged to have been concerned has naturally attracted the attention of Mr. Cathcart Wason, the representative of the Orkney Islands in Parliament, who has constituted himself a kind of watch dog on behalf of anti-motorists. Unfortunately the two or three recent cases where accidents have occurred, and the drivers have not stopped to afford needed

Touring in Holland.—The Dam, Amsterdam.

help, have given him an opportunity of again raising questions in the House of Commons. But the President of the Local Government Board has evidently made up his mind not to be cajoled into immediate repressive legislation on account of the delinquencies of one or two persons. So that Mr. Wason is somewhat disappointed. Mr. John Burns has, however, promised to consider whether some amendment should not be made in the law with regard to running away without stopping after accidents. Again he is handicapped by the knowledge that those who attempt to escape the consequences of their acts are not likely to go any slower if the probable penalty in the event of escape is increased.

Drivers and Traps.

DIRECT evidence of the injury which inconsiderate drivers do to the motor industry comes from Wiltshire, where many protests have been made from time to time against the practice of non-resident motorists rushing too speedily through certain villages. On several occasions the police have issued warning notices, but at length they have decided to take action, and the honorary secretary of the Wiltshire A.C., in sending information of a timing arrangement now in frequent operation, two miles west from Melksbam, on the road from Devizes to Bath, points out that this is a direct result of reckless driving in

the adjoining village of Atworth. We hope it is not too much to ask motorists who are unattached to any organisation, and who apparently at present lack a spirit of camaraderie which should lead them to have regard to public opinion, to moderate their speed when going through populous places.

£1 per Mile.

AFTER the Motor Car Act has been in operation for four years the magistrates at the Brentford Petty Sessions have adopted a course which at least has the charm, as well as the expense, of novelty. The other day, in a case in which a motorist was charged with exceeding the legal limit, the magistrates allowed two seconds beyond the time stated by the police as that occupied in passing through their trap, and then imposed a fine at the rate of £1 per mile for every mile in excess of the legal limit. This new formula is decidedly original, but we sincerely hope, in the interests of offending motorists, that it will not become universal.

Lakeland in the South.

ONE week snow; then rain; followed by a couple of days of sunshine and more cloudy days, has been the climatic succession of late. Travel in some districts was anything but enjoyable last week, and those who participated in the quarterly trials of the Auto Cycle Union discovered Lakeland in Aylesbury. The conditions may have been favourable for the ducks, for which the locality is famed, but they were not conducive to the comfort of the motorists whom duty called that way. The roads on the way to Banbury were swamped, and the landscape about Islip was a series of miniature lakes, little of the land being seen on either side of the road. On the return journey the twenty-nine competitors found they had to ride through a lake a quarter of a mile long just a few miles outside Aylesbury, and a second one of some 200 yards a few miles further on. Some of the most venturesome motor-cyclists actually rode through the water, though it was over their boots and 2 ft. deep, but the majority waded past this unlooked-for obstruction.

Americans in Europe.

"SEEING LONDON" by motor char-a-banc daily emphasises that the American invasion has begun. But not all the visitors from the other side of the Atlantic are content thus to journey around town on a motor vehicle to which other members of the public have access—for a consideration. There are cases not a few of American millionaires who keep a car on this side ready for service when they come to Europe. The other day we were told of an interesting order, now in course of execution, received by a well-known London motor firm. They received a letter from a gentleman in Philadelphia asking them to send a driver to receive a car at Liverpool. He was then to drive the vehicle to Plymouth to meet the owner, and after acting as chauffeur during a two months' stay in this country to see to the vehicle being packed and despatched again to the States. Such orders are by no means infrequent; they come to the people whose names are made familiar to motorists throughout the world by the publicity of the motor Press.

The Motor-Cab.

LONDON is becoming filled with taxicabs, propelled by mechanical means. The growler is being lost to sight; the bansom is silently going to its doom. Those responsible for the introduction of the motor-cab must take heed lest the business is overdone; although that time would appear a long way off if all days were such as Tuesday in town, when the "three-whistle" call was often made in vain—so great was the demand. When London is satisfied with its new means of locomotion the provinces will have to be exploited. Already the movement has spread to some of the seaside resorts, and there strange antipathies and local prejudices have already been aroused.

The Sandgate Urban District Council has refused to grant licences for taximeter motor-cabs, on the ground that the applicants are not *bona fide* residents. The Folkestone Town Council has adopted a similar course, but the proprietors of the new vehicles have overcome the objection by taking up stands on private grounds. There is considerable feeling amongst local cab proprietors over the matter, but the residents recognise that such action cannot stop the ultimate advance of the motor-car.

Garage Accommodation.

So many business men living on the outskirts of the large towns are now using motor-cars to get to and from their offices that there has grown up a need for the provision of adequate public garages for storing their cars during the day in many places. At Glasgow provision has lately been opened not only for business men of the type we have mentioned but also those who reside in the suburbs and who require storage by night as well as day. In London garage provision is being steadily extended with, we trust, good results to those whose enterprise has met the need. There are many suburbs, too, where such provision could be made with hope of financial success.

region beyond. The surveyor to the Council of the county just named has been drawing attention to the damage done by the heavy touring cars keeping to the centre of the road and running in a track, their steel-studded tyres and the high rate combining to give the surface a pitted appearance. This, according to his experience, is more apparent where the road is shaded and enclosed with high walls, hedges and plantations; consequently, he has recommended the Council to insist on all roadside trees being properly pruned, and to allow no new plantation to be made within twenty-five feet of the centre of the road on each side as provided by statute. His suggestion has been adopted by the Perthshire County Council, and it will be interesting to observe its effect in assisting a fine, clean and smooth appearance to be retained on the road surfaces.

National Roads.

ONE of the most important provisions in the Public Health Act which came into operation recently seems to have been overlooked by those who are taking part in the present agitation in connection with improved public highways. We refer to that clause which gives local authorities power to buy land outside their own area for highway purposes. Thus local

The A.C.F. Grand Prix Race.—A Snapshot of two of the Competitors practising on the Course.

Financial Value of Motorists to London County Council.

THAT motor-cars have a financial value to the London County Council is apparent from a return just issued, which shows that there have been licensed by the authorities at Spring Gardens 18,952 motor-cars, 1,882 heavy motor vehicles, and 8,141 motor-cycles. 71,943 licences to drive automobiles of various kinds have been issued, and practically 8,000 changes of ownership in respect to cars and motor-cycles have been registered. These figures suggest a great development in the trade in second-hand vehicles, as well as progress in the business in new cars. Altogether, the Council has netted about £40,000 in fees of one kind and another in connection with the Motor Car Act—a substantial contribution that motorists have made towards the cost of the Local Government.

Maintaining the Road Surface.

MANY of the local authorities in Scotland are discussing motor problems in view of the advent of the touring season along their highways. The opening of the railway system in the Highlands ruined the places on main roads for a number of years, but during the past two or three seasons prosperity has revived on many of these, thanks to the motor-car now so generally employed for touring in Perthshire and the

authorities anxious to improve any main road running through their respective areas are now able to combine for the purpose of joint local improvement in this direction. The importance of such provision is obvious, for while no one authority was likely to make a large expenditure on a great main road, the majority of the traffic along which came from other districts, it may be possible to so arouse the public spirit of four or five adjoining localities as to secure an associative advantage. The point has also interest in its tendency towards a recognition of the national roadway authority which motorists have in public conference advocated on many occasions.

THE promoters of the London Motor Roadways Bill have notified the Chairman of Committees of the House of Lords, the Earl of Onslow, that they do not intend to proceed further with their Bill.

IN our last issue we made mention of the comfortable Canford Cliffe Hotel, near Bournemouth, and, as showing how widely the *M.C.J.* is read, on Saturday we learnt that the Right Hon. A. J. Balfour, M.P., was intending going to the hotel on the Monday with a view of making a stay. This is the right hon. gentleman's first visit, and we are sure he will be delighted with the pine woods and other picturesque surroundings.

RUNS AROUND DROITWICH.

IN Droitwich itself the salt works are interesting—both from the contemporary and historical point of view. The work is not a noisome process, while the vapour given off from the boiling brine is a factor in the health-giving properties of the air. In connection with the works mention may be made of the delightful Salters' Hall, at Droitwich, the illustration of which we are able to reproduce by the courtesy of the proprietor of the Worcestershire Brine Baths Hotel, from his guide to the district.

A charming centre for the motorist is the healthy district of Droitwich, from which easy runs can be made to Worcester and Gloucester and Hereford, with their cathedrals; Malvern and its hills to delight the lover of beauty and test the powers of the car; Tewkesbury and its historical associations; Stratford-on-Avon and its literary claims; Kenilworth, Warwick, and Cheltenham are equally accessible to the visitor. The highways in the vicinity are good for motoring, the hills being easily negotiable, and, where necessary, provided with caution boards. One such hill is at Stoke Prior, where large salt works stand, its great chimney dominating twenty-seven smaller shafts, and taking the name of the Hen and Chickens.

Not far distant, amidst lovely grounds, stands the high-pitched roofed mansion of Impney, a specimen of the French chateau style, built by the late Mr. John Corbett. Another hill that has a double turn, and rapidly falls 100 feet or more, is on the road from Ombersley to Holt Fleet. But on most roads the change in the elevations is not too rapid or dangerous.

On leaving Droitwich by the Hanbury road, with Hadzor House on the right, a pleasant run may be made to Hanbury Hall, the seat of Sir Harry Foley Vernon; but cars are not of much use to climb the deep set lane, overhung with yews, to the noble church that crowns a lofty hill. Everyone should, however, visit this church, with its interesting memorials of the dead and its terraced approach—great trees forming an avenue that springs from one grassy platform to the other—and its incomparable views. For the eye takes in a wide prospect, extending from the mountainous outlines of the Cotswolds, the Brecon Hills, and Malvern Hills, 1,400 feet high, to the almost equally rugged chain of the Abberley Hills, beyond the Severn, and on the opposite horizon the softer mouldings of the Lickey Hills, from which Droitwich gets its drinking water. After visiting the church, whose situation is delightfully reminiscent of Harrow, a wander through the meadows may be taken to Dodderhill Common, for here the beeches might be those of Burnham itself, the brambles borrowed from a Surrey copse, the oaks taken from some Sussex primeval wood, and the cottages bodily transported from the New Forest—landscape that, each in his way, a De Wint, a Collier, a Constable, a Linnell, a Wimperis, or a Vicat-Cole would have limned—and mayhap did.

MOTORING NOTES FROM BRIGHTON.

THE most interesting circumstance of recent date, not merely to motoring, but to every class of visitor to Brighton, has been the extension by the local Corporation of its official benediction to the Kursaal scheme. Those interested in the railway no doubt hope that the erection of such a patent attraction in Brighton will win back much of the first-class passenger traffic of which modern motor-car rivalry is supposed to have robbed it. On the other hand, many people calculate that it will bring more motorists into Brighton than ever, for it will assuredly add a charm to, by providing a specific object for, a day's road-jant down to London's seaside suburb, that does not at present exist. In any case, the Kursaal, if it eventually becomes *un fait accompli*—and there's good reason to believe that it will—is bound to do much towards restoring Brighton's old-time prestige as the smartest and most fashionable holiday resort in England.

THE original plans for the Kursaal, by the bye, which is to be built right on the seashore, between the West Pier and the Hove Lawns, embrace spacious garage accommodation "on the spot," with toilette rooms, of course, and a wonderful restaurant, in addition to the winter garden, concert hall and ball room. So there will be every inducement to the motorist to make it the objective of many a flying visit—both in and out of season. Altogether, Brighton ought to be revelling in a dash of that social *sauce piquante* of Continental cosmopolitanism—in two or three years' time!

THE sudden burst of summer with which May inaugurated her reign did not exert that stimulating influence on the week-end traffic one might have expected. Basking in radiant sunshine, and even gasping with heat, down here on Sunday morning we came to the conclusion that probably the river had greater attractions than the road under such glorious conditions. Then, later, we heard it was raining hard down the London road as far as Crawley. In any case, the motoring arrivals were very few—but the miraculous transformation of Nature they found awaiting them when they got here was voted to be well worth the coming for.

AMONG some of the principal visitors were: Major Jackson, with a fine six-cylinder Brooke car, Mr. Benson (Renault), Major Fortescue (Fiat), Mr. Bullock (Sidleley), Mr. Houldsworth, Mr. Shipley (Horch), Mr. Forman (Minerva), Mr. T. Manning (De Dion), Mr. Friedlander, Mr. Gott, Mr. Nicholson (Britannia), and Mr. E. Wormald, who "stabled" two cars, a Daimler and a James and Browne. In the spacious garage of the Brighton and Sussex Motor Works, Ltd., too, I spent several minutes admiring Mr. Oliver's new Mercedes, a magnificent 75-h.p. six-cylinder car painted and upholstered in bright crimson, with elaborate fittings that shone like burnished gold. Its huge 6-inch Palmer tyres were one noticeable feature—the biggest the Palmer people have made till this year, I was told, although they are now eclipsing that embodiment of tyre-strength and speed with an 8-inch affair, which has, however, not yet been seen. This Mercedes is indeed a beauty—the pride of the garage, of course.

BRIGHTON rejoices in the possession of the only motor-boat club "whose current balance-sheet reveals a satisfactory financial position." At least, so said Mr. H. J. Mann, the secretary of the Sussex Motor-boat Club, at its first annual meeting at the Grand Hotel last week. For a young enterprise, only a year old, the club may be regarded as a very healthy and promising youngster. It has about a hundred members at present, with a fleet of twenty-five boats, but several other craft are building, and will be added early this ensuing season. Viscount Curzon has accepted the commodoreship, in succession to Admiral T. S. Brand, who is leaving Sussex, but Lieut. Sir Theodore Angier, R.N.V.R., and Lieut. O. Sumner continue as vice-commodore and rear-commodore respectively.

SAXONIAN.

GOSSIP FROM PARIS.

THE French drivers who will compete in the Grand Prix race are not content. They think that the Sporting Committee of the French Automobile Club might have given them at least another three weeks' practice on the Dieppe circuit instead of closing it against them from May 1st. The weather previous to that date had been so detestable that they had not profited much by their study of the road, especially as scarcely one of them had the car which he will pilot in the race. The time they spent in "trying the circuit" will not, therefore, give them any appreciable advantage over their foreign competitors who may not have come to examine it. As a matter of fact, however, most of the foreign drivers did come, but, realising the truth, they did not stay long.

NEVER before has sport been talked about so much on electoral rostrums in France as it was in Paris last week. No candidate for a seat in the Municipal Council dared neglect the subject any more than he could disregard the burning question of M. Barthou's Bill for the regulation of automobile traffic. I do not know exactly how many sporting societies there are in the French capital, but the president and secretary of most of them paid a visit to each candidate to impress on him the advisability of securing their members' votes by supporting their demands. They are certainly legitimate, though not modest. Everyone knows that the fortifications and military zone encircling the city are destined to disappear very shortly, and that negotiations are pending for their purchase by the Municipality. The State demands a countless amount of money for the property, but an arrangement of some sort must soon be concluded. Now, there are no fewer than 200 sporting societies which possess no other place than the moat of the fortifications and the military zone for their games or athletic exercises. What is to become of them if that land is sold for building purposes?

THEN there is the question of the health of the population. To insure a satisfactory solution of the question great posters signed by the Touring Club of France, the Alliance of Social Hygiene, the Commission of Urban and Rural Hygiene, the French Association of City Gardens, and the Society for the Protection of the Beauty of French Landscapes were placarded all over the city. These influential institutions espousing the cause of the sporting societies called on the Parisian electors to refuse their votes to every candidate, irrespective of all political considerations, who would not undertake to require of the State the gratuitous abandonment of the fortifications and military zone to the population of the capital, who could not consent "to live in stone prisons." And to insure their election the candidates had to promise that when returned as members of the Municipal Council they would insist on the creation of no fewer than nine parks and open spaces reserved for sports of all sorts. La Ville Lumière must have at least as much light and air as London, Berlin and Vienna, whose inhabitants are at the present moment better off in that respect than the Parisians. Almost every candidate accepted this programme, and the majority of them pronounced in favour of a complete revision of the laws regulating the traffic in the streets and highways. That revision would not, like the obnoxious Barthou Bill, deal with motor-car traffic alone, but with that of horse, ox and hand drawn vehicles. If only the candidates of yesterday keep their promises now they have secured their seats in the Hotel de Ville, the sporting and automobile worlds in France will have no reason to complain. But (especially electoral) promises are, as we used to say in the nursery, "pie crust made to be broken."

MOTORISTS in France are wondering whether the judgment just given by the Appeal Court of Aix, in the department of the Bouches du Rhone, will serve as a precedent to establish the jurisprudence in the matter of excess of speed. Every one hopes so but scarcely dares expect it. Nevertheless, if it is not taken to the Court of Cassation and quashed, no motorist on the

territory of the Republic, be he French or foreign, should for the future be condemned for excess of speed unless the infringement of the regulations be legally noted by two representatives of authority each provided with a chronometer. M. Simon Méry, of Marseilles, had been condemned for furious driving on three separate occasions. His professions of innocence on the two last occasions and the evidence of witnesses had gone for nothing against the gendarme's word, which was taken for gospel in the police court. The Appeal Court, however, only maintained the condemnation for the first offence and acquitted M. Méry on the two other counts. The first sentence of 6 fr. fine was ratified because the excess of speed was sworn to by two gendarmes who, placed at a certain distance from each other, had noted the infringement of the speed regulation with chronometers in their hands. In the other two cases the excess of speed was simply sworn to by one single gendarme, who, moreover, was not provided with a chronometer. This important judgment says, "While admitting the good faith of the official it would be very dangerous to accept in a question of this nature the opinion of one man based on no material certainty, and as the gendarme was quite alone it was very difficult for him to estimate the speed of the motor-car."

THE news of the performance of the Brothers Wright on their aeroplane at Naghead, North Carolina, burst like a bomb amidst all the French aeronauts and flying men assembled last

The Open Country Road.

[Omnia.

Saturday at Issy les Moulineaux to witness the unsuccessful attempts of M. Delagrangé and M. Henri Farman to gain the Armengaud prize of £400 by remaining a quarter of an hour in the air. The great majority of them had been most sceptical concerning the Wrights' previous exploits. But this time there was no sort of doubt. They together on their new aeroplane, or at least one of them—the telegram did not say which—flew two miles "under Government control." M. Archdeacon was perhaps one of the most excited, but he tried to conceal it under the hurry and bustle created by the Delagrangé-Henri Farman match. When anyone spoke to him about it he said, "Voyez-vous ça" (Only think!) and then rushed off in his automobile to the other extremity of the manoeuvring ground to see that all was ready, or called a police officer to beg him to order his men to drive back the crowd which was invading the field. Another very prominent member of the French Aero Club, whose name I am not at liberty to mention, was very outspoken. The telegram received in the morning had not convinced him that the Brothers Wright had ever flown before. If they had formerly effected a circular flight of 24½ miles, remaining in the air 38 minutes, why had they on the present occasion come down of "their own free will" after travelling only two miles? "No, no!" he said, "it looks very much as if they had profited well by their last autumn's visit to Europe, and especially to France. Being intelligent men they learned a lot." Nevertheless, he confessed "the Wrights are fine fellows. They are a little behind our own men, but they are seeking, like us, to solve the problem which is of such paramount interest to all civilised nations." MARNEY.

THE FRENCH INDUSTRIAL VEHICLE AND MOTOR-CAB TRIALS.

THE attention of the French motor world is just now centred on the reliability trial of industrial motor vehicles and motor-cabs organised by the French Automobile Club, which commenced on Friday last week, and will continue until the end of the month. The industrial vehicles are divided into the following nine classes:—1, For loads from 50 to 200 kilogs.; 2, ditto from 200 to 900 kilogs.; 3, ditto from 900 to 1,500 kilogs.; 4, ditto from 1,500 to 2,000 kilogs.; 5, ditto from 2,000 to 3,000 kilogs.; 6, ditto over 3,000 kilogs.; 7, road trains; 8, public service vehicles, carrying from six to ten passengers; and 9, ditto for more than ten passengers. As regards repairs, the components of the chassis are divided into three groups—1, those which may be changed at will; 2, those which will be marked, which can only be replaced by marked spare parts, of which but a limited number are permitted by the regulations; and 3, all parts not comprised in the two previous sections may not under

20th, Nancy; 22nd, Epinal; 24th, Chaumont; 25th, 26th, 27th, Dijon; 28th, Auxerre; 29th, Fontainebleau; 31st, Paris. Exhibitions are to be held at Rouen on May 7th, at Lille on May 13th, at Rheims on May 18th, at Nancy on May 21st and 23rd, and at Auxerre on May 29th, at Fontainebleau on May 30th. Paris being reached on May 31st. Thirty-nine entries were received for the event, and of these the following thirty-six duly weighed in at the Galerie des Machines, Paris, on Friday and Saturday last week, Sunday being devoted to an exhibition. Class 1, two Contal tri-cars; Class 2, a Panhard and a Peugeot; Class 3, a Lorraine Dietrich, a Panhard, and a Brouhot; Class 4, two Peugeots, a De Dion, a Vinot-Deguingand, and two Berliets; Class 5, a De Dion, a Panhard, a Saurer, and two Berliets. Class 6, a Lorraine-Dietrich, two Latils, a De Dion, two Bretin-Cohendets, a Saurer, and two Berliets; Class 7, a De Dion tractor and trailer; Class 8, a Lorraine-Dietrich, a De Dion, two Peugeots, and two Berliets; Class 9, a Lorraine-Dietrich and a Saurer. In view of the fact that the French War Office has announced its intention to purchase some of the competing vehicles a com-

Weighing-in the Competing Cars at the Galerie des Machines, Paris.

any pretext be changed. Pneumatic tyres are not allowed; while no change of tyres, nor of parts of spring wheels, will be permitted. The classification will be made according to categories, and the consumption awards will be based on the formula $\frac{TC}{PD}$, where T = the length of the trial in hours, C the value of the fuel consumed in francs, D the distance covered in kilometres, and P the useful load carried, plus the tare weight of the vehicle. Any form of liquid or solid fuel may be employed, but all cars fitted with internal combustion engines will be required to run on alcohol during a certain number of days. The total distance to be covered during the trial ranges from 3,035 kiloms. to 4,006 kiloms. according to the class. Exhibitions are to be held at various important towns, and on the other days runs will be made from these leading centres, over different routes, about three or four days being thus apportioned to most of the principal towns. The following are the centres from which the various runs are being made:—May 4th, 5th, 6th, Rouen; May 8th, 9th, 10th, Amiens; 11th, 12th, Lille; 14th, St. Quentin; 15th, 16th, 17th, Rheims; 19th, Verdun;

mittes of military officers has been delegated to follow the trials. Concurrently with the industrial vehicle trials a test of motor-cabs is being held, categories being provided for vehicles having single-cylinder engines of 100 mm. bore, and four-cylinder motors of 80 mm. bore. In this class thirteen entries were received, of which eleven weighed in, viz., a Vinot-Deguingand, a Bayard-Clement, three Brouhots, a Dorriot-Flandrin, a Gladiator, two Brasiers, a Prod'homme de Poorter, and a Sultan-Lethemonnier.

AN interesting motor wedding took place at Pulham St. Mary, Norfolk, on Wednesday of last week, between Mr. F. W. Doggett, the works manager of Messrs. Mann, Egerton and Co., Ltd., of Norwich, and Miss Ida Bennett. After the wedding there was a reception at the house of the bride's parents, after which the happy couple drove by motor-car to Forncett Station (being escorted by about a dozen motor-cars belonging to friends), en route for London and the West of England, where the honeymoon will be spent.

SOME CURRENT TOPICS.

The Weigel Grand Prix Racers.

The work of constructing the three Weigel racing cars for the forthcoming A.C.F. Grand Prix contest is well in hand. I had an opportunity the other day of seeing the vehicles in course of erection at the new works of Weigel Motors, Ltd., at Olaf Street, Latimer Road, London, W. Drawings and particulars of the engine and chassis of the cars have already been given in the *M.C.J.* (see issues February 29th and March 14th last), so it need only be mentioned that the engine, which, it will be remembered, has the valves set in the cylinder heads at an angle of 45 deg., and operated off a central overhead cam shaft, is a very workmanlike job. No pains are being spared to turn out a trio of vehicles which shall do credit to British industry in the great International contest. The first car will be ready to be put through its paces on the road about the end of the present week, so that, as the race itself does not take place until the first week in July, there will be ample time to get it thoroughly *au point*, and to incorporate any little modifications found necessary in the two sister vehicles.

Acetylene Lamps.

An interesting point has been raised in France as to which

The dog in the manger is a brute for which none of us has any sympathy, but there are extremes in good nature, and the lending of an expensive motor-car, even to a friend, is one of them."

Water-splashes. A Suggestion for the Automobile Association and the Motor Union.

The competition among the various motoring associations with regard to the sign posting of the dangerous points on the main roads of the country has done much to increase the safety of traffic of all kinds, not merely that of automobiles. There is still another useful piece of work for one of the more enterprising bodies to undertake. Although they are now relatively few and far between, there still exist in different parts water-splashes across the road, through which one has to plough or make a long *detour* to avoid. Being a southerner I can for the moment only call to mind three of these water-splashes, but there are doubtless many others. Those I refer to are respectively one near Shepperton, another in the neighbourhood of Thames Ditton, and the third on a by-road leading towards Chessington, in the Epsom district. Although I am now accustomed to all three, I well remember the nervous feeling which came over me when, early in my motoring career, I found the way interrupted by these strips of water. The object of this note is to suggest that not only might a list of these water-splashes be compiled,

Mr. R. Reynold Jackson at the wheel of his Jackson 8-h.p. Single-Cylinder Racer, on which he will next week attempt to set up a new class record on Brooklands Track.

Mr. Jackson brought the vehicle round to the offices of the *M.C.J.* a few days ago, where its novel appearance quickly made it the centre of an interested crowd.

is the better form of acetylene head light—those of the self-contained type, or those with separate generators. There is, of course, much to be said for both patterns. On the one hand, the steps of the car are left unencumbered, while in case of a *panne* at night time the combined generator and lamp prove very handy. On the other hand, headlights with separate generator are much lighter in weight, while the fact that there is for the two lamps only one generator to look after and keep clean is a point which appeals to many motorists. There are other *pros* and *cons* on the subject, and the views of the readers of the *M.C.J.* on the matter will be welcomed.

Should a Motorist Lend his Car?

A motorist at Hove has, I notice, raised the question in one of the daily papers as to whether a motorist should lend his car. He answers it in the negative, and I imagine that there will be few automobilists inclined to disagree with him. "I wonder," he writes, "how many motorists have suffered a loss of friendship, as I have recently, through refusing to lend their cars, even when they themselves have no intention of using them on the particular day. Is it unreasonable to say, 'I would rather not,' when a friend asks, point blank, for the loan of your car, for which you have given, perhaps, £1,000 or more, and which may be returned to you a hopeless wreck? Of course, the friend will 'have it fixed up,' but—every motorist knows what that means.

but that warning boards might be erected on both sides, giving an indication as to whether the splash can be safely crossed, and whether this should be done at the right, left, or in the centre. As many of the splashes are running streams, it would, perhaps, hardly be possible to give the depth of the water, as this most probably varies considerably in wet and dry weather. Anyway, I commend the suggestion to the notice of the Automobile Association and the Motor Union.

A Remedy for Wet Driving Seats Wanted.

Among the large circle of readers of the *M.C.J.* there must be many who have when out driving been caught in the rain, and experienced the annoyance, not to say danger, of a wet seat. Front glass screens have, of course, done much in the way of protecting the driver, but still the rain has a nasty habit of trickling down the upholstery on to the cushion, where, if the bad weather be of long duration, a pool gradually collects, which may have very detrimental effects on one's health. The old *parapluie* formed an excellent protector against the attack both front and rear of Father Pluvius, and it seems somewhat a pity that the "umbrella" through which one wriggled should have apparently gone out of fashion during the past year or so. If any motorist can suggest a remedy for the trouble mentioned, many fellow automobilists will, I am sure, feel grateful.

ARCANUM.

SOME NOTES ON MOTOR-CAR SPRINGS.

SO soon as man and beast ceased to be the only means of transporting one's self or goods from one place to another, the problem of how to make the new mode of conveyance as comfortable and little fatiguing as possible to those who were being conveyed has always been a matter of supreme importance. One might, in confirmation of this, go back to the various methods adopted by the Romans in their racing chariots, and so on, by different stages, through the evolution of all carriages up to the present time, but space will not permit, neither would any useful purpose be served by going into the dim and distant past.

Now that self-moving vehicles, with their greater speeds, extreme lightness of construction, with consequent increased vibrations, both in number and volume, have come more into evidence, the question of the best medium to intercept such vibrations on their passage to the occupants is a most important one. The motor-car labours under many disadvantages that do not apply to the rolling stock of a railway company, which has a perfectly smooth road, no steep gradients or many other trying conditions that are ever present in one form or another with the vehicle now under review. It is not within the province of this

cease the "easy rolling motion" and take a bumping or bounding movement, and, though the time that they are clear of the ground or not getting a sufficient grip to assist its propulsion forward may be far too short to be detected by the eye, the forward movement of the car is being impeded. In some cars the springs have to take on, in addition to their ordinary duties, the "rear action" of the drive, which is that part which tends to elevate or lift the car off the ground, when the engine exerts its force, so it will be seen what an important part the springs of a car play in relation to its general wear and tear, tyres included.

The most common form of spring on motor-cars, and one which has been found universally satisfactory under almost every condition, is the laminated type. It may be divided into two sections—the "grasshopper" and the elliptic. These consist of a number of plates held together by clip bolts; the mode of security varies according to circumstances, some being attached or slung on pins at either end, while others are hinged at one end and connected by shackles at the other. The grasshopper pattern, which is really half an elliptic, is often made without eyes or finished ends, but with a hole in the centre of the plates, the latter being made extra wide to give the necessary margin of strength. The spring ends of the bottom plate simply rest on the axle; these springs then take a bearing down and end rocking motion, such as on the front axles of tractors. 

A Batch of 16-20-h.p. Beeston Humber Cars being Tested on the Road.

The vehicles are fitted with a rough two-seated body, while the back contains weights equivalent to people. After a 200-mile trip they are taken back to the works and carefully looked over for the slightest sign of anything wrong.

article to attempt to embrace the many ideas and designs that have been tried as antivibrators, as they would include everything from the air tube of the tyre to the latest thing in spring seats, but to confine matters to springs and their immediate surroundings, with a passing reference to shock absorbers.

The difficulty with those who have given much time to the subject has been to find a spring that is flexible and effective and at the same time will stand the strains and weights. Some estimates have recently been given as to the number of vibrations per minute that steel springs take; that the rapidity of action is very great is beyond doubt, but, owing to the varied conditions under which they work, to attempt to calculate such a quantity seems to the writer unwise, as it can only apply to individual cases, and so may be misleading to adopt any standard as a whole.

Springs to a very large extent in all self-moving vehicles not only regulate the ease and comfort of the conveyance, but, when properly balanced, considerably reduce the wear on the tyres, engine, and carriage work; they economise power, make driving easier and ensure greater accuracy in steering. The proper action of a wheel is to roll along over the surface on which it is travelling—a spring's greatest movement is just after the car has overcome any sudden variation. If a spring does not take and give off its load at the right moment the wheels

Both the foregoing patterns need careful attention at least once a year. One oftentimes hears it said that a car is not so comfortable to ride in as it used to be, and the fault is laid to the tyres or uneven road, when it is really the springs that have become clogged or rusted up through moisture getting in between the plates, either from rain or car washing and cleaning, and the springs are not acting properly. In time the plates become set, and for a spring to correctly carry out its functions each piece should work freely and clear of its neighbours. When it is found that such is not the case, the whole should be disassembled, scraped, oiled, and any possible fractures looked for; if there are any, of no matter how small a nature, a new plate is necessary. The plates should then be reassembled, when they should move freely on depression.

Doubtless shock absorbers will come into much larger use in time, but their cost and additional weight prevents them coming into more general practice. Mr. O'Gorman, in a recent paper read at the R.A.C., stated that it might be found possible to use spiral springs in conjunction with shock absorbers, thus reducing the car weight; if this proves to be the case, they could without doubt be used with advantage. The spiral spring has been tried on travelling wheels in various forms, both on motor-cars, tractors, and other self-driving vehicles, but without any great measure of success.

E. T. H.

THE Montreal Light, Heat and Power Company, of Montreal, Canada, has lately acquired an Argyll three-ton 26-30-h.p. motor-lorry.

A VETERINARY surgeon in Coventry is now using a 15-h.p. Humber car on his daily rounds. One result of the innovation has been the enlarging of his practice owing to his now being able to cover longer distances in a short space of time.

SIR JOHN and Lady Lister-Kaye have just returned to London from a motor tour in France and Italy.

WE gave some particulars and a general view of the new 10-h.p. two-seater steam car recently introduced by Turner's Motor Manufacturing Company, Ltd., in the *M.C.J.* of April 4th

THE Belfast Co-operative Society, Agnes Street, Belfast, have lately acquired an 18-h.p. Siddeley motor-van for bread delivery purposes.

"WELL, Pat, after a year at the motor school, I suppose you understand everything?" "All but one thing, sir." "What's that?" "What makes the thing go without horses?"

MR. C. B. HILL, hon. secretary of the Dorset Automobile Club, has lately acquired a Hotchkiss 16-20-h.p. car.

ON the day that the cars engaged in the International Touring Car trial set forth from Glasgow on their journey south, General Booth will start from Dundee on another motor mission, finishing, not at Brookland, but at the Crystal Palace.

Elevation and Plan of Chassis of the Turner-Miesse Two-Seater 10-h.p. Steam Car.

- A. Generator.
- B. Engine.
- C. Flywheel and brake drum.
- D. Cardan shaft.
- E. Rear axle casing.
- F. Extension of crankshaft to operate air pump supplying fuel tank.
- F'. Air pump supplying compressed air to fuel tank.

- G. Chain drive from crankshaft to countershaft.
- H. Countershaft.
- H'. Shaft driven through spring drive from H.
- H². Fan.
- H³. Condenser.
- K. Water pump eccentric.
- K'. Mechanically operated water pump.

- L. Throttle and brake pedal.
- M. Lever for forward, neutral or reverse positioning of valve camshafts.
- N. Spring drive to counter-shaft.
- O. Steam release lever.
- P. Paraffin tank.
- Q. Water tank.

last. We are now able to publish an elevation and plan of the chassis, which clearly shows the disposition of the various parts of the mechanism. To the information already published we may add that the complete car only weighs about 15 cwt., so that the tyre bill should be extremely low. So also should the cost of fuel, seeing that ordinary American paraffin, which can be bought at under sixpence per gallon, is used, and that the consumption is only about one gallon per hour. We understand that the new model has already met with a favourable reception on the part of motorists.

IN order to meet the increasing requirements of West-end patrons, Messrs. Harvey Frost and Co., Ltd., have considerably extended their premises at 27, Charing Cross Road, London, W.C., where a large stock of H. F. vulcanising materials and tools, and also H. F. vulcanisers, is now installed. Every requirement, therefore, can now be promptly met at the firm's West-end address. Any reader desiring a free demonstration on an H. F. appliance can obtain same by calling, or through the medium of an introduction card, obtainable at most of the motor depots in London and the provinces.

KING EDWARD has this week taken delivery of a new 58-h.p. Daimler car with Hooper body.

THE Hon. Lord Masham has ordered from the Daimler Company a 38-h.p. live axle chassis fitted with a "Birdlip" limousine body. Sir George Bullough has also ordered a 38-h.p. chassis.

THE order for the 9-h.p. motor delivery van lately placed by Messrs. Lever Brothers, of Port Sunlight, with the Star Engineering Company, Wolverhampton, has, we learn, just been increased to eighteen.

THE Berkshire County Council having refused to erect notices limiting motorists to certain speed through the village, Streatley Parish Council has agreed to send application direct to the Local Government Board, pointing out the great danger to children and others.

A FIRE occurred shortly after midnight on Sunday on the premises of Messrs. Rice Bros. at Horsham, whereon were stored 700 gallons of petrol. The firemen made strenuous efforts to protect the neighbouring property, and loads of sand and ashes were obtained from the gasworks. Fortunately the floor of the store was two feet below the level of the ground, so that the spirit was not carried away, as would have been the case had it been on level ground. It was not till 6 a.m. that the fire brigade left the scene.

WE give herewith a sectional view of a new silencer for petrol engines which has lately been put on the market by Mr. John Bousfield, of the Bar Iron and Motor Works, Micklegate, York. As will be seen, the gases pass into a large expansion chamber and then find their way through a series of alternately-

arranged perforated baffle plates. Mr. Bousfield claims that not only does his new silencer render an engine extremely quiet, but by reducing the back pressure more power is developed. Furthermore, there is no danger of it becoming choked. The exhaust box is being made in various sizes suitable for motors of from 6 to 80 h.p.

THE three Weigel cars for the A.C.F. Grand Prix race will be driven by men under the control of Weigel Motors, Ltd., but as there is a large section of the motoring public who are desirous of driving in races, the makers would be pleased to hear from any amateurs who care to consider driving the cars in the Ardennes races and the Vanderbilt Cup contest.

THE 1908 catalogue of Metallurgique cars just issued by Messrs. Warwick Wright, Ltd., of 110, High Street, Marylebone, W., gives explicit descriptions of the points of all five models, lucidly illustrates such outstanding features as the clutch, spring-drive, rear-axle, carburettor and gears, and gives all conceivably desirable information. It is not an abnormally large catalogue, but contains more useful matter than is generally found in such compilations. A copy can be had on application.

FROM Messrs. Ward and Goldstone, of Springfield Lane, Salford, Manchester, comes a copy of their latest catalogue of electrical accessories for motor vehicles. The list is very complete, giving full particulars of the firm's specialities in the way of accumulators, sparking plugs, coils, electric head lights, recharging batteries, inspection lamps, voltmeters, &c. A speciality is the "Hydranamo," a small combined water motor and dynamo, by means of which ignition accumulators can, to use the firm's phrase, "be charged from the cellar tap."

FOR lending his motor driver's licence to his father an Axbridge motorist has been fined 10s. and costs.

MR. W. F. PARKER, whose Oxford Cycle and Motor Car Company is well-known to visitors to the University town, has placed a motor taxi-cab on the streets and has several other automobiles to let on hire to visitors.

RECENTLY we have recorded the presentation of motor-cars to the Bishops of Southwell, Liverpool, Newcastle and Stepney. Now we learn that the new Dean of Carlisle has been presented with an automobile by his late parishioners in Marylebone.

AMONGST recent purchasers of Daimler cars are the Right Hon. Lord Clanmorris, Bangor Castle, co. Down, Ireland, who has acquired a 30-h.p. live axle "Blackdown" landaulet, and Lieut.-Colonel Britton, Winford Manor, Winford, Somerset, whose choice is a 36-h.p. chassis.

AMONGST the latest orders received by Messrs. Jarrott and Letts for the new model 12-h.p. Sizaire-Naudin car are those from Mr. James McKelvie, of Edinburgh, the Brooklands Racing Club, Mr. Robert Bird, of Birmingham; Captain Kershaw, Harbour Master at Gravesend, and Captain Hawkins, of New Zealand.

THE luxury of motor travel can now be enjoyed by Londoners between Queen's Gate, by way of Brompton Road, Piccadilly, and Brompton, by the 20-h.p. single-deck Charron motor-bus just put in service by the company with which Mr. D. Dalziel is associated. The fare is sixpence for any distance along the line of route. Provision is made for nine passengers, for each of whom an armchair is provided.

THE extensions which have lately been made to the motor engineering shops of Messrs. Wayte Bros. in Lemon Street, Dublin, have converted their establishment to one of the most thoroughly equipped motor depots in the Irish city. They have developed the hiring out of cars at their other establishment in Ann's Lane. Recent orders in this connection have included an urgent contract for six cars for mechanical transport service for the Government.

IN the grounds of the Franco-British Exhibition, which opens at Shepherd's Bush on the 11th inst., there will be thirty miles of roads. Two of the main roads, three miles in length, are now prepared for heavy traffic; and as they will have to stand not only the carting of heavy exhibits, but the motor-cars in which visitors will be carried, they have been made very solidly. They consist of 5-in. timber baulks, covered with a sprinkling of ashes, 10 in. of hard core, 4 in. of ashes, and 6 in. of gravel.

ON Tuesday, before Mr. Justice Parker in the Chancery Division of the High Court, the case of Dams and Meares v. Locke-King was commenced. This was an action brought to restrain an alleged nuisance caused by the racing on the motor track at Brooklands. Mr. Upjohn, K.C., explained that the plaintiffs were local residents, who also alleged breach of covenant entitling them to the quiet enjoyment of their premises. Their complaints were of the noise of the cars in the private road, in the garages and on the track, noise from the crowds of people who congregate, and the fumes, smell and dust associated with the vehicles on race days. The case had not concluded when we went to press.

IN connection with the article on "The Causes of Motor-Car Accidents" in our last issue Messrs. Dennis Bros., Ltd., write that "there are multitudinous causes for breakdowns which we get into our repair department, and we do not think that any particular one predominates. We certainly should not think that the majority of work in the repair shop is rendered necessary by accidents at cross roads. We have had a rough calculation made from our repairs during the past twelve months. Altogether we had in 1,693 ordinary repair and overhauling jobs, and of these only 64 were due to accidents. From this you will see that the majority of the work was due to ordinary wear and tear rather than to accidents. This we find is less than was the case several years ago, when accidents were far more frequent than they are at present, due, we assume, firstly to the greater reliability of all makes of cars, and secondly to an increasing scarcity of inexperienced drivers."

CONTINENTAL NOTES.

A Special Car for German South-West Africa.

The German-Daimler Company has lately completed at its works at Marienfelde a special six-seated car for the German Colonial Office, for service in German South-West Africa. Fitted with a 45-h.p. four-cylinder engine, one of the most novel features is found in the fact that not only are the four road wheels driven but act as steerers. In view of the conditions under which the vehicle is to be used special attention has been devoted to rendering all the parts not merely dust but sand proof, while, in order that the engine shall not overheat when working under full load at a low speed, the ordinary radiator is not only larger than usual

but is supplemented by one formed round the edge of the dashboard and by two cylindrical water tanks at the side of the bonnet. The road wheels, which are of the disc type, are shod with 930 by 125 mm. pneumatic tyres.

The Motor-car Industry in Italy.

Signor Dr. Bonardi has recently made a study of the motor-car industry in Italy for the Italian Minister of Agriculture, and has presented a report, in which statistics are given of the various motor-car works in the country, the number of which now amounts to eighty. In 1907, 725 cars were imported into Italy, of a total value of £330,650, and 1,283 were exported, valued at £807,410. From a review of the trade it is seen that the exports were mainly large touring cars, while the number of small vehicles imported was on the increase, this being due to the fact that the Italian firms made a speciality of large and luxurious cars, for which there is not a large market, on account of the high prices demanded. The number of cars running in Italy is relatively small, and the trade has to depend to a great extent on the export business. In 1905 there were only 2,124 in use in Italy, increasing in 1906 to 3,366. He furthermore states that, as the number of motor-car works in Italy is far in excess of the demands of the market, it will be necessary for the makers to combine or to transform their works into other fields of construction; and he expresses regret that there is no movement to develop the construction of motor-omnibuses and wagons. He suggests that makers should study the question of applying the internal combustion engine to agricultural machinery, as this branch has hitherto been largely unexploited.

A Deflated Tyre Indicator.

An ingenious device to give warning to the driver of a motor-car of the presence of a deflated tyre has recently been brought out in France by Messrs. Loitard Freres, of Paris. Briefly, it is nothing more nor less than a tiny alarm gun affixed to the rim of the wheel, and arranged to be fired automatically when the tyre pressure falls below a certain predetermined amount. A little tube is mounted in the rim, and carries at its outer end a small metallic cartridge held in place by means of a screw cap. A small chamber just behind this contains a spring-actuated firing pin. The latter is held in the "cocked" position by an extension in the form of a slotted tube, which engages a

groove in the edge of the rim, where it is clamped in place by a small plug mounted on a butterfly nut, similar to those carried by the ordinary security bolts. As soon as the tyre pressure falls to the danger point, the force holding the plug in place is relaxed sufficiently to release the firing pin and explode the powder charge contained in the cartridge, so giving an effective warning of the deflation.

British Motorists in France.

Among the British motorists recently visiting France with their cars are Lord Dunedin (40-h.p. Pilain), Lord Newborough (30-h.p. Hotchkiss), Mr. and Mrs. Truby Williams and Miss Parker, of London (24-h.p. La Buire), Sir Neil and Lady Menzies (35-h.p. Panhard), Captain Balfour, London (40-h.p. Daimler), Mr. P. S. Douglas Hamilton, London (40-h.p. Weigel), Sir John and Lady Campbell (45-h.p. Mercedes), and Mr. Alex. Labin, London (50-h.p. De Dietrich).

A Motor Race at Marseilles.

The Automobile Club of Marseilles is organising a 150 mile race for single-cylinder cars up to 110 mm. bore and four-cylinder cars up to 95 mm. for the 28th inst. The event, which is known as the Circuit Provençal des Petites Voitures, will be held on a 30 kilometre course, which will have to be covered eight times.

The St. Petersburg-Moscow Race.

Interest in the St. Petersburg-Moscow race, to be held on the 31st inst., has been increased by the fact that Mr. Chas. Jarrott will be taking part in the contest at the wheel of a De Dietrich. Other well-known drivers who will participate in the event include Duray, Wagner (Fiat) and Demogeot (Darracq). To date seventeen cars have been entered for the race, which is being organised by the Moscow section of the Russian Automobile Club.

Miscellaneous Items.

A steam motor fire engine is being added to the equipment of the brigade of Biebrich-am-Rhine, Germany.—The

One of the Brixia-Zust Motor-cabs lately put in service in Rome.

Munchener Elektromobil Betriebs Gesellschaft is the name of a company which has just been formed in Munich to introduce a service of electrical motor-cabs and carriages in that city.—The French Post and Telegraph Authorities are inviting tenders for the transport of the mails between Peronne and Moislans (Somme), by motor vehicles.—A public motor-car service is about to be established between Gien and Autry, France. Steam 'buses of the Purrey type are to be employed.—It is reported that the Russian War Authorities are carefully watching the industrial vehicle trials in France, with a view to placing an order for thirty military motor wagons.

ACCESSORIES FOR TOURING.

A New Filing Tool.

In the show-rooms of Messrs. Peto and Radford, Ltd., at Hatton Garden, London, E.C., we have seen a new filing tool for use on the platinum contacts of induction coils. The device consists of a large and small circular file working in a metal tube which has side handles. The plan of operation is as follows:—The platinum contacts on the trembler blades are trimmed by removing the screw contacts from the bridge, inserting the small end of the file through the hole in the bridge, and filling up the contact. This is supported by a piece of wood or card placed beneath it. The contact on the blade can also be trimmed by removing it from the coil and holding it firmly against the large end of the file, which is then revolved by the handle. The screw contact can either be filed by inserting it into the small hole at the top, holding it firmly with the thumb, the two fingers grasping the handles, or, if the screw is too large to pass through the hole at the top, it can be filed at the larger end, using the lock-nut as a means of keeping it perfectly true and steady.

Electric Lamps for Cars.

Motorists who have electric lamps on their cars have frequently been worried and annoyed by the breakage of the carbon filaments of the lamps. Such disasters have been regarded as unavoidable in presence of the vibration to which the car is subjected. Several attempts have been made to overcome this vexatious condition of things, but it has remained for one of the pioneers in the adaptation of electric lamps for automobiles to provide an effectual remedy. Messrs. R. and J. Old-

Fig. 1.

Fig. 2.

field, of Warwick Street, Birmingham, the firm in question, secure this desirable end by interposing a thick rubber disc around the rigid connection which secures the lamp socket. This absorbs all the vibration, and experience has shown that it does this most effectively. In Fig. 1 the lamp is shown with the interposed rubber disc. It will be seen that the wiring is carried down to a double pole plug. There is also a three-yard length of flexible wire with a double pole socket at one end to engage with the plug in the lamp-holder. At the other extremity is a double pole plug which connects up with the wiring of the car and gives the required freedom of movement for an inspection lamp. In Fig. 2 is the brass or wire guard to enable the lamp base to be detached and used for such a purpose. Economy and efficiency are well combined in the device which Messrs. R. and J. Oldfield are now introducing.

An Ingenious Wind-screen.

Recent rainy weather has revealed to many motorists the defects of those wind-screens that allow the rain to completely obstruct the vision. The wet remains on the glass and the difficulties of the driver are by no means relieved by such devices. Recognising this, Mr. A. W. Hemmings set to work to remedy the obvious drawback, and, with the Earl's Court Motor and Garage Company, has brought out a screen which greatly obviates the disadvantages hitherto associated with such accessories. This screen is in the usual top and bottom portions and can be operated from the seat with ample security, while it can be set at any convenient angle. In the upper half of the glass screen is an aperture 10 in. or 11 in. long by about 5 in. deep—although this can be varied as desired—through which the driver can see while the rain is beating pitilessly on the device. Thus the vision of the chauffeur is in no way

impeded, while the passengers are well protected from the weather conditions. When this aperture is not required the glass can be swung over and the distinctive feature of the screen closed by a glass or celluloid shutter, thus restoring the device to the usual appearance. Mr. Hemmings has brought the screen out at an opportune time, and inquiries with regard to other necessary details should be made to him at the Earl's Court Garage, adjoining Earl's Court Station, London, S.W.

Motor-car Wheels.

A divisible rim has been patented by the Coventry Motor Wheel Company, of Fleet Street, Coventry, whose patent detachable wire, artillery and staggered spoke wheels are well known. In the latter case all that is necessary to detach the wheel is to slack out the nuts, give the nave-plate a slight turn till the holes are opposite the nuts, when the wheel and nave-plate will pull off.

Repairs to Cars.

A recent visit to the extensive and extending works of Panhard and Levassor, at Acton Vale, London, W., has revealed the capacity of the firm for dealing with cars that have suffered mishap. We saw half-a-dozen that had been in the wars, one that had encountered a tram; others that had been cornered by other cars at cross roads, steering deranged, members of the frame bent and other signs of damage present, all being put right by the efficient staff of mechanics under charge of Mr. W. A. Turpin. The repair department is not confined to the renovation of chassis, for there are departments specialising on carriage work, lamps, upholstery and tyres—all adequately equipped for promptly executing any special work entrusted to their care. During recent months many ordinary tonneau bodies have been converted into fashionable side entrance ones at these works, which occupy a site of about two acres in extent. The stock of spare parts, &c., is valued at several thousand pounds, and a full range of accessories is kept in the showrooms. The range of enterprises undertaken by the firm is exceptionally wide, including wind screens, canopies, wheels, &c. Not only are these supplied, but repairs to all such accessories are carried out. Whenever a motorist meets with a mishap to his car he can have it sent to this well-known Acton Vale establishment, from whence it will be returned with necessary replacements, &c., in the minimum time.

Pullman's Non-skids, &c.

The non-skid devices of Messrs. R. and J. Pullman, Ltd., of the Westbrook Mills, Godalming, are well known to motorists as reliable and durable means to a very desirable end. For the coming season they are making a feature of the "Steelbur" type and also the "1908 detachable," the latter being fitted with the registered clip of the firm. This device is to meet the demand for detachable bands, and the clip will materially assist the operation of fitting and removing, while, owing to the special construction of this band, the studded portion when worn out can be renewed at a cost of about half the original expense of the band. The "Leather" — a combination of leather and rubber — continues to maintain its reputation, while the "Steelbur" offers a combination which should become equally popular. This is a rubber and steel-studded band in which the studs, being embedded in the rubber tread, require no intermediate lining to protect the cover. In addition to providing the motorist with non-skid bands of an excellent type, Messrs. R. and J. Pullman, Ltd., also undertake the re-rubbing of tyres and repair work of every variety. All the leather used in their productions is actually prepared by them, and their chamois leathers, &c., should always be ready to hand when on motoring expeditions.

MESSRS. OLDFIELD, Warwick Street, Birmingham, the manufacturers of the well-known "Dependence" lamps, have opened a London depot and showrooms at 215, Shaftesbury Avenue, W.C., under the management of Mr. P. J. Oldfield, one of the directors of the company.

ON Tuesday last we had an opportunity of going over the works of the Motor Radiator Manufacturing Company in Tanner Street, Bermondsey, S.E., and of inspecting the manufacture of radiators under the Zimmermann patents, the principal advantages claimed for which are strength, tightness and efficiency. Round tubes of drawn brass are employed; the composition by which they are welded together is a secret preparation, but it may be mentioned that it possesses the same expansive properties as the tubes themselves, and under the influence of heat gives a solid surface which ensures an absolutely watertight wall combined with a perfectly even filling between the tubes. The works are equipped with up-to-date plant, the various shops comprising carpenter's, plating, galvanizing, testing, tin-smithing, drilling and cutting departments, which are all under the personal supervision of Mr. P. O. Serck, the manager director of the company in this country.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

ROADS IN FRANCE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—During my recent trip in France I noticed a very large number of workmen employed on the road throughout the whole of France from the north to the south, digging trenches at intervals of every 200 metres, over half the width of the road, alternately to the right and left. The manner in which this was being done, whereby the trench was dug and the earth out of it piled up in the middle of the road, without any warning of any sort, nearly caused me on several occasions to have an accident. The regularity with which the work was performed and the tremendous distance over which the operations seemed to extend eventually led me to inquire from some of the workmen as to the object of the trenches in question, and I then found that the Administration of Control of the Routes Nationales was proceeding throughout the whole of France with the testing of the metalled highways, so as to take note of the thickness and composition of the roads.

It appears that every sixty years a test is made as to the increase or decrease of the capital which these roads represent, as shown by the thickness of the road surface, and to enable the Administration to see whether the maintenance of the road in question has been expensive or otherwise. The complete testing is taking over two months, and is estimated

In a sucker, the middle of the leather is lifted while the edges remain with a firm grip on the ground due to partial vacuum. In a motor-tyre it is just the reverse, the edges of the tyre lifting before the middle of the tread so that not much suction is formed.—Yours truly,

H. LOMAS.

DRIVERS' LICENCES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the case of the chauffeur who forgot the expiry of his licence, and whose employer was summoned, would it not be possible for motorists to unite to persuade the Government to abolish the section of the Act requiring driving licences when the Expiring Laws Continuance Bill is read at the end of the present session?

Any tendency towards furious driving which the abolition of licences might create could easily be counteracted by heavier fines or even by imprisonment in flagrant cases. Driving licences lead to too many technical offences, such as learning to drive without a licence, or driving if the driver was taken ill, &c. Can anyone be convicted of driving without a licence who merely steers a car to set the driver's hands free a moment? Has this doubtful point ever been definitely decided?

Motoring in Sumatra.—Crossing the Betimeos River.

[De Auto.]

at a cost of about one million francs. I cannot say that I appreciated the surface of the roads after these trenches had been dug, as, even when they were filled in, the damage done to one's tyres was very considerable; but I thought the whole idea was educational, as showing the enormous difference in the manner in which the highways are looked after in France, as compared to the half-hearted manner in which road-making and up-keep is attended to in England.

The operation in question may, from a practical point of view, be entirely unnecessary, but the fact remains that the French as a nation realise that in their highways they have a national asset, and, this being the case, their welfare and up-keep is attended to by a special committee, working on businesslike lines.—Yours truly,

CHARLES JARROTT.

THE EFFECT OF STUDDED TYRES ON ROADS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whilst looking through the *M.C.J.* I came across a reply to Capt. Windham in regard to studded tyres. "Studions," in the issue for March 28th, 1908, states that he is surprised that "Capt. Windham should make such a dead set against such a useful and reliable invention as the studded tyre." Personally I agree with Capt. Windham. That the studded tyre is a useful article on greasy roads there is no doubt, but at the same time I cannot agree that the plain, soft rubber tread does more damage than hardened steel studs. I do not see how his illustration of the boy's sucker comes in with a plain tyre.

Motorists would be wise, in my opinion, to accept quietly the speed limit until the dust nuisance has been abated by more general tarring of the roads.

As high-powered cars are going rather out of favour, it will not much matter whether there is a speed limit or not. There are very few roads here where I should care to drive 20 m.p.h. on my 6-h.p. car. Low-powered cars seem to be rather in favour in my district of Buckinghamshire.

With regard to the present minimum age of seventeen at which anyone may drive a motor-car, some means would have to be found of enforcing the observance of this rule if driving licences are abolished—probably the best means would be to require every car-driver to produce proof to the police-sergeant in his district that he was over seventeen, say a declaration from parents or guardians to that effect.—Yours truly,

CECIL JACKSON.

THE CAUSES OF ACCIDENTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much interested in the article on the above subject in the last issue of the *M.C.J.* The many bad points of the professional driver are always being referred to in the motor press, but, as a chauffeur of some years' standing, I venture to submit that there is another side to the picture. Very few owners of motor-cars realise that there is a limitation of the powers of a driver. The latter often finds that the duties devolving upon him are in part to make an early morn-

ing trip to the owner's office, then to return to take madame on a shopping tour, followed by a drive in the afternoon, the theatre at night, and then, perhaps, a ball, which keeps him from his bed until the early morning hours, allowing only a brief time for sleep, and then to repeat with slight variation the same thing the next day. Obviously human nature can stand this strain only for a very short time. Then, when mentally unstrung and physically tired, an emergency arises, the driver is not capable of the clear, quick thought and action necessary to avoid an accident, he is blamed for carelessness when in truth the condemnation should be visited upon the head of the employer who, considering only his own desires, demands of another that which no man is capable of giving. The point I have endeavoured to bring out is, I am sure, a contributing cause of accident too often unsuspected and rarely, if ever, remarked.—Yours truly,

A. DRIVER.

AN IGNITION DIFFICULTY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter from R. Johnston in the last issue of the *M.C.J.* regarding a mysterious case of "missing," I have recently experienced a similar trouble. In my case I found it to be due to a greasy and poorly connected earth wire. Perhaps Mr. Johnston's trouble may be due to a similar cause.—Yours truly,

PUTNEYITE.

A NOVEL VALVE-REMOVING TOOL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just received a copy of the *Motor-Car Journal* of January 3rd last, in which I note a very good reproduction of a photo of my 8-10-h.p. Talbot car, for which accept my best thanks. I notice that you have spelt my name wrong, "Beere" instead of "Beebe," but that is only a small matter, we being so many miles apart.

- A.—Wing nut.
B.—Cross head to rest upon heads of cylinders when cylinders are cast separately.
C.— $\frac{1}{2}$ in. solid rod screwed at each end for wing nut and to fit into T piece to be required length.
D.—Ordinary $\frac{3}{4}$ in. T piece used by gas fitters.
E.—Forged to fit under washer of valve stem and to work freely in T piece D.

I noticed in the issue received a very simple valve-lifter; I had one made to my own idea for my car, which has cast separately cylinders, a rough drawing of which I enclose. This idea may be of interest to some of your readers. To place the valve-lifter in position slip E out of the T piece D, drop the rod down between cylinders, replace E in T piece D, put fork under washer of valve spring and screw up wing nut A.—Yours truly,

W. BEEBE.

Bendigo, Australia.

HIRING OUT CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We note that one of your correspondents who is compelled to give up his trade through ill-health, asks for advice upon the above subject, and if it will be of assistance to "G. G." we have pleasure in giving you information for him based upon the experience of those of our clients who have carried out this business on a small scale. Taking your correspondent's questions in the order set forth, we may inform him that it is possible to buy a car and hire it out profitably. Exactly what "G. G." implies by "private" hiring we do not know, but to be thoroughly successful hiring of every sort should be undertaken and advertising in the local papers, hotels, &c., must be carried out if enough work is to be obtained. A great deal depends upon the locality and upon existing hiring facilities; if at a mere sea-side pleasure resort the business will chiefly be a summer one, which, of itself, cannot be made to pay, as it must be borne in mind that depreciation of a car takes place throughout the whole year. Our client's experience has been that regular hiring is necessary if the busi-

ness is to be profitable, and in certain districts this can be obtained from commercial travellers, &c., providing the car is a small one.

As regards a good make of car for this purpose any of the well-known makes would be satisfactory, and it would not do to specify any particular car in this letter. A hood and wind-screen are indispensable for hire work; as regards cost, it is impossible to state definite figures from the information given, but a carefully fitted out car of some 12-14-h.p., not more than twelve months old, could be obtained for about £220. Such a car would be quite satisfactory if due precautions were taken in its selection and purchase. A car of medium power, of not too great a weight, would be most suitable, and for the kind of work which "G. G." contemplates a fairly small car—which could be profitably hired out at a low sum, would be best. These points, and the general condition of the mechanism would be the important ones to observe when buying.

The licence it would be necessary to obtain is the usual driver's licence, and the tax the usual Inland Revenue for a four-wheeled motor-propelled carriage, together with motor-car registration fee; if the car were to "ply for hire" in the same way as a cab or wagonette, a licence as a public vehicle would also have to be obtained. This service, by the way, can be made to pay in certain instances in seaside towns, where a sixpenny trip can be made to and from the local "attractions," such as ruins, cricket grounds, racecourse, &c. Trusting these brief remarks may be of use to "G. G."—Yours truly,

MARKHAM AND PRANCE.

Consulting Motor Engineers.

THE POSITION OF PEDALS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in the subject of "Position of Pedals" in your recent issue. It is without doubt a topic worth discussion, as it is responsible not only for the safety of the public, but also the occupants of the car. Even a careful driver is apt to neglect his duty until it is too late, when proceeding through a busy thoroughfare; and when, in the excitement of a tight corner, he jams down his right foot! But, alas! he has caught the accelerator pedal, with obvious results.

In most makes of cars there are three foot pedals, two to be worked by the right foot and the other by the left foot. Now the two that are worked by the right foot are as follows:—One for increasing the speed and the other for decreasing the speed. Why not have the pedals placed thus—have the two pedals that have practically the same action, viz., the clutch and the brake pedals, fixed to be worked either by the left or the right foot, so that in a tight corner it matters not which of the two is depressed in a hurry? Hoping this will have further discussion.—Yours truly,

L. HULL.

LOSS OF POWER.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—My car—a single-cylinder 8-h.p. with chain drive—which for a long time has given me great satisfaction, has lately caused me a little worry. Everything about the engine—compression, valves, ignition, &c., appears in good order, but whenever I try to get the car on the top third speed, the power of the motor seems to die away, and were I not to quickly drop to the second gear it would stop. On the second speed the engine pulls splendidly without any sign of trouble, but the moment I change up the difficulty begins. The result is that I have to drive on the second even on the level, and although the engine is running fast, progression is slow. If you can give me any hints as to the cause of the trouble and its remedy I should be greatly obliged.—Yours truly,

EASTBOURNE.

[If "Eastbourne" is quite assured that there is no appreciable loss of power in the engine we suggest that the loss of power may be due to the chains and sprockets. Chains exposed to the dirt (as nearly all motor chains unfortunately are) soon lose their efficiency of transmission by wearing, and so stretching. The teeth of the sprockets also wear to an incorrect form. When the chain has stretched and its pitch is thus altered it no longer leaves the teeth of the sprockets sweetly, and this causes an appreciable loss of power. A lot, of course, depends on whether the chains are kept clean, and the joints well lubricated. Boiling them in a mixture of tallow and graphite powder, and subsequently wiping off superfluous grease, is a good practice. In large cars, where there is a surplus of power to spare, the loss of efficiency in transmission through worn chains is more difficult to notice, but in a little eight horse power car like the one we are dealing with there is no power to waste, and it is therefore quite possible that our correspondent will find that new chains may enable him to get along on the top speed again. There are, of course, other things that may be causing the trouble, such, for instance, as want of alignment in the sprockets, worn bearings, &c.]

A READER asks for the best route from Sudbury (Suffolk) to Ramsgate, avoiding London.

"FLORENT" writes:—"I should like to hear the experiences of readers who have used flake graphite in the oil in the crank case of their engines."

THE ROVER CARS.—"Marathon" writes asking users of the popular little 8-h.p. Rover cars to give their experiences of the same, especially as to the cost of running, the tyre bill, &c.

THE IRISH RELIABILITY TRIAL.

The following details of the cars that will compete in the Irish Reliability Trials towards the end of the present month will be of general interest.

[In cases where there are blanks in the details the particulars have not yet been supplied to the club.

ROAD REPORTS.

MARGATE.—The Council have decided to paint with tar portions of the main roadways. Hitherto the County Council have paid part of the cost incurred in watering these roads. They have now notified their intention to discontinue doing so, but have promised to pay half the cost of tar painting.

NECESSITY OF SOUND CONSTRUCTION.—In the course of a paper on "Roads and Road Making," before the department of Civil Engineering of the Birmingham University, Mr. H. E. Stilgoe, the city engineer and surveyor, detailed the methods of modern road making and urged the necessity of securing a sound and well-drained foundation as a means of securing that a minimum of dust only should be raised by traffic using the same.

EAST STIRLINGSHIRE.—The surveyor to the Eastern District Committee of the Stirlingshire County Council on speed of motor-cars notices "that where motorists observe the ten mile per hour restriction on roads they do little damage and raise very little dust when the roads are dry." The work of widening and filling out the drooping sides of some of the roads is being continued, so that the drivers of vehicles will ultimately be able to obtain the free use of the full width of the road when approaching motor or any other traffic. Mr. W. Ballantyne, the surveyor, refers to the increase of through going motor traffic, and deplors the excessive strain on the surface of the road caused by steel-studded tyres.

PUTNEY.—A local correspondent writes:—"If there is a thoroughfare more unfortunate than Piccadilly in the attacks made upon it by people whose mission in life it is to tear up roads, then surely that thoroughfare is Putney High Street. It is very rarely that the stretch of road from the top of the High Street to the other end of Putney Bridge is quite free from excavations. Take the last six months, for instance. For many weary weeks the road across the river bridge and its vicinity was more or less in a state of chaos. Now that disadvantage to traffic is removed, the road over the railway bridge is "up"! Unwieldy motor-buses, cars, drays, &c., all have to ascend or descend the incline in the space of a few yards. A better opening for a numerous set of accidents has seldom been offered—even in Putney High Street."

HERTFORDSHIRE.—The Herts County Council has decided to tar fifty miles of main roads in the county at a cost not exceeding £40 a mile. They are also applying to the Local Government Board for an order limiting to a rate not exceeding ten miles an hour the speed of motor-cars passing along Pinnocks Lane and the High Street in Baldock Urban District.

MIDDLESEX.—The Middlesex County Council has decided to ask the Local Government Board to make regulations under the Motor Car Act, 1903, prohibiting the driving of motor-cars along certain roads in Teddington urban district and Shepperton parish at a speed exceeding ten miles an hour. The roads affected are Waldegrave Road, Twicken-

ham Road and Manor Road, in Teddington, and the main road through Shepperton from Halliford Green to Ferry Lane. With regard to the application made some time ago for the reduction of the speed limit of motor-cars in the portion of Hillingdon East, from the eastern boundary to Lees Road and from Harlington Road to the top of Hillingdon Hill, the L.G.B. has reported that they think it desirable to issue a regulation under the Act restricting the speed of motor-cars along so much of the road as extends from Harlington Road to the top of Hillingdon Hill. With regard to the remaining length of road included in the application, the Board do not consider that sufficient reason has been shown to justify them in prescribing a reduced speed limit and they have therefore decided not to include it in their order.

LANCASTER.—The well-known trap at Scotforth is again in frequent operation and several motorists have lately been caught therein. It leads to the Lancaster County Police Court.

WANSTEAD.—The police in this part of Essex have lately been watchful of motorists, and two or three "controls" have been constituted on the roads leading to Woodford and Epping Forest.

COMPANY NEWS:

ROADITE.—April 14th. £2,500 (2,000 preference). Agreement with F. S. Ingle and S. Howard. Manufacturers, vendors, or factors of material known as Roadite, for making, repairing, or improving roads &c. 22, Milsom Street, Bath.

MOTOR RACING TRACK.—April 13th. £5,000. To acquire certain inventions and patents relating to the construction of motor vehicles, tracks, and railways for amusement and like purposes; to adopt an agreement between P. Marshall, C. C. Metcalfe, W. Knowles, and H. H. Martyn of the first part, the said H. H. Martyn of the second part, and the company of the third part, &c. 25, Brazennose Street, Manchester.

HEATH GARAGE.—£12,000. To acquire business of automobile engineers and factors carried on at Birmingham as G. F. Heath and Co. Agreement with G. F. Heath and H. P. Barker. 49, John Bright Street, Birmingham.

SOUTH OF ENGLAND AUTOMOBILE COMPANY.—£5,000. 38, Dover Street, W.

ECONOMIC AUTOMOBILE COMPANY.—£1,000. Makers of automobile carriages under licence from M. J. Journaux, of Paris.

ANTI-SKIDDING MOTOR SYNDICATE FOR EUROPE.—£1,000. 26, Wormwood Street, E.C.

BRITISH SIMPLEX MOTORS.—£12,500. Agreement with P. Piellat and O. C. Selbach. 110, High Street, Marylebone.

THE Daimler Company have received an order from Lady Brynmor-Jones, through Messrs. Wm. Whiteley, Ltd., of Westbourne Grove, London, for a 30-h.p. Blackdown landaulet.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE Coventry Motor Club and the Society of Road Traction Engineers have decided to be associated with the R.A.C. Upwards of 100 associates are down for election at the meeting of the R.A.C. General Committee to be held to-day (Saturday) at Nottingham.

THE MOTOR UNION.

AN enthusiastic scene was witnessed at the monthly meeting of the Motor Union, held at the Hotel Cecil, when Mr. Joynson Hicks, M.P., the chairman, presided. Delegates gave the chairman a musical greeting, and a vote of congratulation was proposed by Mr. C. H. Dodd (Reading), seconded by Mr. R. H. Oldfield and supported by the Rev. Altamas Ward, chairman of the Bristol and Gloucester A.C. Responding, Mr. Joynson Hicks, M.P., said he received great assistance from motorists in his contest, and now that he was in the House the interests of the motor world should not be lost sight of.

Col. H. J. W. Jerome, C.B., of Bilton Hall, York, was elected an additional representative of individual members.

A discussion took place on inconsiderate driving, in connection with complaints received by the Highways Protection Committee, and in regard to one person complained of mention was made that he had since been prosecuted and had had his licence suspended for twelve months. The Union is prepared to prosecute in cases in which the persons complaining are prepared to give evidence and the committee consider that the circumstances warrant prosecution.

Delegates were appointed to a conference of various road organisations to take place after the second reading of the Licensing Bill, to

Siddeley, Sims, Swindley, Williams, and Woollen. Mr. E. M. C. Instone was voted to the chair.

Mr. E. Manville was unanimously re-elected president of the society, and Messrs. S. F. Edge and C. Jarrott were elected vice-presidents.

The Committee of Management was elected as follows:—Messrs Powell, Instone, Atkey, Gascoine, Siddeley, Burford, Scraker, C. Johnson, Coleman, Mann, Letts, and Lanchester.

Two new local sections were formed, namely, one to cover the counties of Huntingdon, Cambridge, Bedford, and Hertford; and the other to cover the counties of Cardigan, Pembroke, Brecon, Carmarthen, Glamorgan, and Monmouth.

At a meeting of the Tyre and Accessories Committee on the 27th ult., replies from members to the circular on the standardisation of rims were considered, and the secretary was directed as to further inquiries to be made on the subject.

A meeting of the committee of the British Manufacturers' Section was held on the 30th ult., when the position in connection with the organisation of the Brussels 1910 Exhibition generally and of the Motor section in particular was reported, and a recommendation was made to the Management Committee that the society should be represented on the Commission with a view to a collective exhibit.

MOTOR CYCLING CLUB.

THERE were no fewer than forty-four entries for the hill climb of the Motor Cycling Club at Sharpenhoe Hill, near Luton, on Saturday. Fortunately the weather was different to that which had been experienced in the early part of the week. The following were the officials:—

The Sharpenhoe Hill Climb.—Mr. S. F. Edge on his 40-h.p. Six-Cylinder Napier and Mr. Charles Jarrott on his 12-h.p. Sizaire-Naudin.

consider what steps should be taken in order to deal with the need for travellers' facilities to procure solid food in addition to liquids.

It was reported that over 520 local authorities had so far passed the resolution for the proceeds of motor and other vehicle taxation to be paid into a central fund, from which grants should be made to local authorities toward expenditure on the roads.

Report was made that the Union had entered upon the task of signposting in a model manner the London-Folkestone-Dover road.

AUTOMOBILE ASSOCIATION.

AMONG the 282 new members elected to the Automobile Association at the committee meeting on Tuesday were the Marquis of Linlithgow, Dowager Marchioness of Linlithgow, Sir Geo. Mackenzie, Major Hon. Alg. Hanbury-Tracy, Capt. Lord Herbert Scott, Major Sir. Leger Jervis, Baron Gunther Diergardt, Sir C. Harding, G.C.M.G., General Hon. E. S. Wortley, Hon. Dudley Carleton, Major-General Vesey Dawson, Hon. F. S. Grimwade, Hon. Miss Mills, Hon. Mrs. Howard, Hon. J. Woodroffe, and Hon. Lady Harvey.

SOCIETY OF MOTOR MANUFACTURERS AND TRADERS.

THE meeting of the new Council of the Society of Motor Manufacturers and Traders was held on Thursday week. There were present:—Messrs. Atkey, Atkinson, A. Brown, Burford, Carver, Clarkson, Coleman, Dennis, Edge, Farnell, Gascoine, Hutton, Instone, Jarrott, H. Johnson, Lanchester, Lisle, H. J. Lloyd, Mann, Moyes, Mulliner, Powell

Judges: Messrs. R. H. Head and E. C. Davis; timekeepers: Mr. F. Bidlake and assistant; marshal: Mr. Victor Abraham; stewards: Messrs. Frank Russell, C. Hunt, J. Godfrey, W. O. Scales, B. Richardson-Billings, and F. S. Biggs. The results were as follows:—Class I. (for motor-bicycles): R. M. Brice, 3½-h.p. Brown, 50½ sec., 1; W. A. Sale, 3½-h.p. Rex, 52 sec., 2; W. A. Jacobs, 3½-h.p. Rex, 60½ sec., 3. Class II. (twin-cylinder motor-cycles): W. H. Wells, 5-h.p. Vindec Special, 49½ sec., 1; E. Pond, 5-h.p. Vindec Special, 51½ sec., 2; F. White, 5-h.p. Rex, 52½ sec., 3. Class III. (passenger motor-cycles): E. Brewerton, 10-h.p. Lagonda, 1 min. 58 sec., 1; A. F. Hsley, 8-h.p. Phoenix, 2 min. 57½ sec., 2. Class IV. (cars): S. F. Edge, 40-h.p. Napier, 1 min. 2½ sec., 1; J. W. Stocks, 24-h.p. De Dion, 1 min. 24½ sec., 2; E. A. Anthony, 15-18-h.p. Ford, 1 min. 25½ sec., 3.

ROADS IMPROVEMENT ASSOCIATION (INCORPORATED).

THE annual general meeting of the Roads Improvement Association was held at 1, Albemarle Street, Piccadilly, W., on the 30th ult. Earl Cadogan, K.G., occupied the chair, and in moving the adoption of the annual report the hon. secretary mentioned that the past year had been one of the most important during the life of the association. The International Road Congress which is to be held in Paris in October, 1908, will doubtless have the effect of practically demonstrating the need for the various reforms in our existing system of highway administration which has been so long advocated by the association.

At the council meeting held subsequently, Earl Cadogan, K.G., was re-elected president; the Hon. Arthur Stanley, M.P., vice-

president; Mr. Robert Todd, chairman; Col. R. E. Crompton, C.B., M.Inst.C.E., M.I.A.E., vice-chairman; and Mr. W. Rees Jeffreys, hon. secretary and acting treasurer.

BROOKLANDS.

THERE are ninety-five entries in the races to be held to-day (Saturday) as follows:—

LIMIT SWEEPSTAKES (between six and eight miles).—G. C. G. Moss, 27.2-h.p. Arrol-Johnston; D. Pigot, 35.7-h.p. Berliet; H. G. Nalder, 35.7-h.p. Berliet; J. W. Stocks, 25.6-h.p. De Dion; P. D. Stirling, 35.7-h.p. Berliet; T. A. Scully, 44.5-h.p. Delaunay-Belleville; A. van Hoboken, 71.7-h.p. Mercedes.

MAY CUP HANDICAP (about five miles).—G. C. G. Moss, 27.2-h.p. Arrol-Johnston; P. D. Stirling, 35.7-h.p. Berliet; F. N. Lloyd, 20.1-h.p. Clement-Talbot; H. G. Nalder, 35.7-h.p. Berliet; A. H. Moreing, 38.1-h.p. Daimler; G. Russell-Miller, 22.4-h.p. De la Buire; C. Hobson, 48.6-h.p. Brasier; C. Hobson, 27.9-h.p. Nagant-Hobson; G. Dhveen, 34.6-h.p. Mercedes; the Marquis St. Mars, 39.6-h.p. Napier; J. H. Bell, 59.6-h.p. Bianchi; J. Bullough, 41.9-h.p. Junior; H. C. Halahan, 17.5-h.p. Dennis; C. A. Bird, 34.5-h.p. Mercedes; J. L. Farmiloe, 24.8-h.p. Mercedes; A. van Hoboken, 71.7-h.p. Mercedes; O. S. Thompson, 40-h.p. Austin.

FOURTH 26-H.P. RACE (about three miles).—S. F. Edge, 25.6-h.p. Napier; J. W. Stocks, 25.6-h.p. De Dion; O. Cupper, 25.6-h.p. Metallurgique.

FOURTH 40-H.P. RACE (about 18½ miles).—S. F. Edge, 38.4-h.p. Napier; S. F. Edge, 39.6-h.p. Napier; the Marquis St. Mars, 39.6-h.p. Napier; A. Huntley-Walker, 40-h.p. Darracq; Walter Phillips, 38.4-h.p. Humber.

FOURTH 90-H.P. RACE (about 5½ miles).—F. R. Fry, 76-h.p. Mercedes; E. De Wilton, 76-h.p. Mercedes; S. F. Edge, 90-h.p. Napier; Warwick J. Wright, 100-h.p. Darracq.

From a Sketch

(Issued by the Berliet Company.)

ALL-COMERS' HANDICAP (about 7½ miles).—C. Hobson, 48.6-h.p. Brasier; O. Cupper, 48.2-h.p. Metallurgique; P. D. Stirling, 35.7-h.p. Berliet; H. F. W. Farquharson, 35.7-h.p. Berliet; E. de Wilton, 76-h.p. Mercedes; G. C. G. Moss, 27.2-h.p. Arrol-Johnston; F. R. Fry, 76-h.p. Mercedes; B. S. Millard, 8.9-h.p. Sizaire; D. Pigot, 35.7-h.p. Berliet; F. N. Lloyd, 20.1-h.p. Clement-Talbot; H. G. Nalder, 35.7-h.p. Berliet; S. F. Edge, 38.4-h.p. Napier; S. F. Edge, 25.6-h.p. Napier; J. W. Stocks, 25.6-h.p. De Dion; the Marquis St. Mars, 39.6-h.p. Napier; C. A. Bird, 34.5-h.p. Mercedes; R. G. Empson, 8.9-h.p. Sizaire; P. L. D. Perry, 22.5-h.p. Ford; P. L. D. Perry, 22.5-h.p. Ford; Walter Phillips, 38.4-h.p. Humber; A. van Hoboken, 35.7-h.p. Mercedes.

TOURING RACE, HANDICAP (about 8½ miles).—T. A. Scully, 44.5-h.p. Delaunay-Belleville; O. S. Thompson, 6-h.p. Wolseley; C. Hobson, 27.9-h.p. Nagant-Hobson; J. H. Bell, 59.6-h.p. Bianchi; T. Faulkner, 41.9-h.p. Weigel; R. C. Empson, 8.9-h.p. Sizaire.

To provide covered accommodation for spectators in the half-a-crown enclosure, it has been decided to do away with the former five shilling enclosure, and to include all that ground in the portion allotted to the half-a-crown patrons. The charge for admission to the reserved lawn is being reduced to ten shillings.

A request having been addressed to the club by Mr. Colin Defries that he should register the name "Behemoth" for a Porthos car, the committee has decided that the registration of names can be accepted on the following terms:—The cylinders of the car for which a name is registered to be measured, sealed, and stamped by the Officer-Measurer of the Club, at a fee of one guinea. The name of the car thus sealed will remain registered as long as the seals on the cylinders are unbroken; if the cylinder seals are broken it shall become void, unless the cylinders are re-measured officially and found to be of the same size, a renewed charge of one guinea being made. When entered for races cars with registered names will be given by the name of the maker,

without mention of h.p., with the registered name in inverted commas; thus, Mr. Colin Defries' car will be mentioned in the race card as:—

Mr. Colin Defries ... Porthos ... "Behemoth"

The committee hope that the registration of names will be adopted, as it seems desirable that individual cars should be readily recognised by the public when appearing on a race card.

AUTO-CYCLE UNION.

THE conditions for the next International Auto-Cycle Tourist Trophy Race can be obtained on application to the secretary. The following entries have already been received for this race:—

SINGLE-CYLINDER CLASS.

| | | | |
|------------------------|-----|-----|--------------|
| C. R. Collier (holder) | ... | ... | 1 Matchless. |
| M. J. Schulte | ... | ... | 3 Triumphs. |

MULTI-CYLINDER CLASS.

| | | | |
|------------------------|-----|-----|------------|
| H. Rem Fowler (holder) | ... | ... | 1 Machine. |
| T. Teasier | ... | ... | 1 Bat. |

Mr. M. J. Schulte has offered a silver cup to the first, and a gold medal to the second and third private owners in the single-cylinder Class.

The preliminary regulations and route for the Land's End to John o' Groat's Trial, which will take place from July 13th to 18th, are now ready, and will be sent to intending entrants on application.

The last quarterly trial of the A.C.U. was held on Wednesday of last week. Thirty-one entries were received, and of this number the large proportion of twenty-nine actually started. Despite the road conditions good times were made up Dashwood and Gore Hills, Amersham. Fourteen non-stops were recorded, and first and second class certificates will be awarded at the discretion of the judges to the machines which successfully completed the trial.

LINCOLNSHIRE.

THIS club continues to maintain the best of relations between the local authorities and motorists: it provides a centre of information and advice in connection with the automobile movement. It organises hill-climbs, speed trials and social meets for its members. In conjunction with the Motor Union it takes an active part in matters such as speed limits, and, recently, has required a bridge to be built where a level crossing was intended by the promoters of a light railway. It is essentially an amateur club and is composed of Lincolnshire people only.

HUDDERSFIELD.

THE Huddersfield branch of the Y.A.C. had great influence in preventing a speed limit in the town some years since, and since then have succeeded in getting signs put up in the district directing motorists to other towns. They have also arranged for the Local Council to put up a danger board at a dangerous crossing. The club holds an annual hill climbing competition, and in July each year takes about 100 patients from the Huddersfield Infirmary on to the moors. In addition to these things they, of course, consider all matters dealt with by the Motor Union and give their assistance where possible, so that they are well deserving of the support of all motorists in the locality.

MOTOR.

ALTERATIONS are in full swing at the Motor Club, and in another month the committee hope to open the new smoking and billiard rooms. A bridge and billiard handicap are both in progress and a golf handicap is about to be commenced; forty members have entered. Several cricket matches have been arranged to take place.

The British Motor Boat Club are holding a regatta at Lowestoft on Whit Saturday, June 6th, and it is proposed to have a club run down there on the 5th, watch the regatta, hold a dinner on the 6th and return to town on the Sunday, so that members may be able to attend the meeting at Brooklands on Whit Monday.

SOUTHERN.

THE Southern Motor Club is to-day (Saturday) holding a members speed-judging contest. The members will meet at the Chequers, Horley, at 4 p.m.

ESSEX.

THE annual meeting of the Essex County Automobile Club was held at the G.E.R. Hotel, London, on Wednesday of last week, Mr. Burnett Tabrum, J.P., presiding.

The report having been adopted, the following were re-elected:—President, the Earl of Warwick; vice-presidents, Col. Lockwood, M.P., C.V.O., and Col. W. Nevill Tufnell; chairman, Mr. Burnett Tabrum; hon. treasurer, Mr. Wilfred Arkwright; hon. auditors, Messrs. A. W. Wyon and L. E. Halsey.

HEREFORD.

THE trials which were to have been held upon the Cockshut Hill next week have been postponed in consequence of experimental runs made by members of the Herefordshire Automobile Club. It was found

upon testing the hill that although its gradients were suitable for the purpose, the meandering course was one which could not be negotiated without chances of mishap. There is now a possibility that at the eleventh hour the trials will be held at the Frome's Hill. Negotiations are in progress between the club and the Bromyard authorities with this object in view.

HERTFORDSHIRE.

THE opening meet of the Hertfordshire County A.C. for the present season took place on Saturday, Mr. and Mrs. R. A. Cooper inviting the members to Ashlyns Hall, where genial hospitality and pleasant weather combined to make the gathering a good success.

Mr. F. STANLEY BRIGHTMORE, of the Lord's, Barnley Dun, has been appointed district hon. sec. of the Sheffield A.C. for Doncaster.

A MOTOR-CYCLE club has been formed for Waterford and district. Mr. W. J. Corder has been elected president; Mr. W. E. Bowers, Ferrybank, hon. sec.; and Mr. M. J. Murphy, hon. treasurer.

THE first motor-car meet in East London (South Africa) was recently carried out by the local automobile club, when a number of motor vehicles journeyed out in company to Summer Pride, returning at the end of the day.

THE first annual meeting of the Sussex Motor Boat Club has been held at the Grand Hotel, Brighton, with Alderman Ross Morrison in the chair. The club's membership numbers about 100, with a fleet of about twenty-five boats, and the secretary, Mr. H. J. Mann, mentioned that theirs was the only motor-boat club showing a favourable position in their current balance-sheet.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.

At the Shoreham Petty Sessions, Alfred Tye, of Sevenoaks, was summoned for exceeding the speed limit along the upper road P.C. Brett put his speed at thirty miles an hour, and said that when stopped defendant remarked, "My speedometer was eighteen miles an hour." Defendant said that just before entering the measured distance he was warned, and therefore went very carefully, at the rate of eighteen miles an hour, according to his speed indicator. The chairman advised him not to rely on the speedometer in future, and a penalty of £4 and 12s. 6d. costs, or fourteen days, was imposed.

Five motorists have been fined sums of £3 each for driving beyond the speed in Bath Road, Reading. Similar cases have been heard during the last few days at Woolwich, Shoreham, Midhurst—where seven cases of exceeding the legal speed at Rake were heard—Croydon, Wimbledon and Chertsey.

Over £50 was taken in fines inflicted on motorists at the Guildford County Petty Sessions on Saturday. One of the defendants, Frederick Johnson, of Putney, ran into two traps on the Portsmouth road, at Whitley and Thursley, within the space of ten minutes. In each case the police stated that the speed exceeded thirty miles an hour. As he had been previously convicted, a fine of £10 was imposed.

On Monday nineteen motorists were fined over £100 by the Arundel county magistrates for exceeding the legal limit on the Worthing Road, in the parish of Poling; in Angmering; on the Chichester road, in the parish of Binstead, and the Chichester road at Walberton.

Several summonses against drivers of cars for exceeding the legal limit at Ashington, Common and Rock Washington were disposed of at the Steyning Petty Sessions on Tuesday. Penalties of £4 10s., £4 18s., £5 11s., £5 10s., and £5 14s. inclusive were inflicted. In the case of a London chauffeur who did not answer personally to the summons, it was decided to issue a warrant, to be suspended for a fortnight, in order to enable defendant to attend.

At Epsom, on Tuesday, eight motorists were fined 40s. each for exceeding a speed of twenty miles per hour.

A man summoned at Feltham on Monday for driving a motor-car in Bushey Park at over nineteen miles an hour, called a witness, who said one of the occupants was a man who had a split heart which had been sewed up again. With a man like that in the car, he explained, they dare not go fast. But defendant had to pay £3.

On Saturday seven motorists were fined £34 10s. and costs for exceeding the legal limit at Codmore Hill, Pullborough, on Good Friday.

CARELESSNESS IN PROSECUTION.

Singular laxity was proved against the prosecution during the hearing of a summons at the Reading Police Court, against the Marquis of Downshire, of Easthampstead Park, Wokingham, for exceeding the speed limit and driving his motor-car to the common danger, on April 4th. The Marquis, on the advice of his solicitor, Mr. C. H. Dodd, pleaded not guilty. Mr. Dodd said the offence was alleged to have been committed on May 4th. The Bench dismissed the first count. Mr. Oldfield said that in regard to the second charge undoubtedly the driver was the Marquis of Downshire, as, when written to and requested to say who was driving the car, he replied that he was. Mr. Dodd produced the letter which the Marquis received from the police, in which his lordship was asked to say who was driving his car on the 3rd inst., whereas he was summoned for an offence said to have been committed on the 4th. The Marquis was driving his car on the 3rd. The Bench could not possibly convict under the circumstances. The chairman,

addressing Mr. Dodd, said, "We have to decide in your favour. Mr. Dodd: I think so; you can't help it. I think we ought to ask for costs, but we won't trouble about that. The Chairman: The Bench wish to express their opinion regarding the carelessness with which the case was prepared. It was entirely through carelessness that the summons had failed."

DANGEROUS DRIVING.

Great interest was taken in the re-appearance at Woking Police Court on the 1st inst. of the chauffeur in the Ripley Road tragedy, Arthur Meston, aged 20, of 15, Camera Square, Beaufort Street, Chelsea, who is charged with having on April 25th, recklessly driven a motor-car thereby causing the death of John Bryan, formerly of the 2nd Queen's, Regiment. No further evidence was taken, Superintendent Marks intimating that he was instructed by the Treasury to ask for another remand until after the adjourned inquest had been held. Prisoner was accordingly remanded until the 15th inst., when in all probability some sixteen witnesses will be examined. Upon the application of his counsel, prisoner's bail was extended until committal.

RECKLESS DRIVING.

Mr. C. B. Lockwood, 19, Upper Berkeley Street, London, W., was summoned at Marylebone Police Court for driving a motor-car recklessly along Finchley Road and failing to stop when requested by a constable. Giving evidence he said that a section of constables, eleven in number, were marching in single file across the Finchley Road and he thought they had an intention of obstructing him. The magistrate thought the incident was due to a misunderstanding, dismissed the first summons, and fined the defendant 10s. and costs on the second.

The Siddeley 18-h.p. 30 cwt. Lorry recently supplied by the Wolseley Company to the Oxford Co-operative Society, Ltd., through Mr. T. C. Warland, for delivering goods in and around Oxford.

THE LONG DISTANCE TRAP.

The chauffeur of Lieutenant A. de Portal Kingsmill was summoned at Reading, on Tuesday, for (1) driving a motor-car to the common danger; (2) exceeding the speed limit. Mr. Rowland Harker (instructed by Messrs. Amery Parkes, Macklin and Co., solicitors to the Automobile Association) represented the defendant. Mr. Oldfield, for the chief constable, elected to proceed only on the charge of exceeding the speed limit. Four constables were called, all of whom swore to the number of the car. Their evidence disclosed the fact that the chief constable of Berkshire had adopted the long-distance motor-trap, and that they had not reported to the chief constable that the defendant was guilty of driving to the common danger.

Mr. Harker declared that the police knew that there was no case of driving to the common danger. The bringing of such a charge was, he contended, a trick to extract from the owner of the motor-car the name of the driver, which could not have been obtained from him on the mere charge of exceeding the speed-limit. Lieutenant Kingsmill gave evidence to the effect that at the time of the alleged offence the car was seventeen miles away from the spot alleged by the police. The chairman, after consulting with the other justices, said the case would be dismissed.

We learn that the sole agency for the sale of the Delage light cars in Great Britain and Ireland has been secured by Messrs. Drake and Gorman, of 65, Victoria Street, London, S.W.

OUR contemporary "System" has an excellent article by Mr. W. A. Rogers on a systematic automobile selling organisation, selecting the firm of Messrs. Jarrott and Letts, Ltd., as having "a system of thorough departmentalisation that reflects its influence on every individual employed."

FORTHCOMING EVENTS.

—●—
MAY.

- 9th (Sat.).—First provincial meet of the R.A.C.—to be held at Nottingham, by invitation of the Nottinghamshire A.C.
Penalty speed judging contest of the Southern M.C. at the "Chequers," Horley.
Brooklands A.R.C. meet.
Cheshire A.C. meet at Pentrevoelas.
Manchester A.C. reliability run.
- 13th. (W.).—Incorporated Institution of Automobile Engineers—Discussion on the effect of motors on roads.
- 14th (Th.).—Mr. G. H. Baillie at the R.A.C. on Petrol and Petrol Tests.
- 16th (Sat.).—Fifty miles Consumption Trial of the Hertfordshire C.A.C.
Liverpool A.C.'s opening meet of the season.
Auto Cycle Union hill climb.
Liverpool A.C. first meet of the season.
New Forest A.C. club run to Brockenhurst.
Sheffield A.C. meet at Langsett 3.15 p.m., for run over Woodhead and via Glossop to Snake Inn.
- 21st (Th.).—25th.—Reliability Trial of the Irish A.C.
- 18th (Sun.).—Targa Florio Race.
- 23rd (Sat.).—Clipstone race meeting of the Notts A.C.
Meeting of the Yorkshire A.C. at Helmsley.
Meet of the Motor Union at Bournemouth.
Motor Cycling Club—Albert Brown Challenge Cup for cars.
Meet of the Sheffield A.C. at the Royal Oak at Edwinstone 2.30 p.m.
Sir C. B. Locock, Bt., will entertain the Essex C.A.C. at Braintree.
- 25th (M.).—Industrial Vehicle Competition of the A.C. de France.
- 26th (Tu.).—Motor Gymkhana on the links of the Ross Golf Club at Alton Court—Mr. T. H. Coombes, "Montrose," Ross, is the hon. secretary of the event.
- 28th (Th.).—Visit of the Aero Club to Aldershot.
- 30th (Sat.).—Meet of the Herts C.A.C. at Hatfield Park.
Devon and Cornwall A.C. hill climb at Moorshop, Tavistock.
Lancashire A.C. speed judging contest.
- 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow.
Penalty run of the Southern M.C. to Goring.

JUNE.

- International Aeronautical Federation conference in London.
- 5th—6th.—London—Edinburgh twenty-four hours' run of the Motor Cycling Club.
- 6th (Sat.).—Brooklands A.R.C.
- 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
Start of the International Touring Car Trial of the R.A.C. Brooklands A.R.C.
- 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
- 11th (Th.).—Start of the International Touring Car Trial of the R.A.C.
- 13th (Sat.).—Hill climb of the Notts A.C. at Oakmoor.
Speed Trials of the Lincs. A.C. at Grimsthorpe.
N. Middlesex A.C. speed judging competition for the Gamage Cup.
Essex C.A.C. hill climb at Bottledown Hill, Billericay.
- 14th (Sun.).—Mont Cenis hill climb for voiturettes.
- 15th—19th.—Scottish Reliability Trial.
- 17th.—Close of Prince Henry Touring Competition in Germany.
- 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
Annual Hill Climb of the Bristol and Gloucestershire A.C.
- 27th (Sat.).—Saltburn beach races.
Buxton meet of the Manchester, Sheffield, and Lincolnshire clubs.
Members of the Cheshire A.C. will participate in the Gymkhana of the Manchester A.C.
Visit of the Essex C.A.C. to Audley End.
- 28th. (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
- 6th (M.).—Grand Prix A.C.F. (Voiturette section).
- 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
- 11th (S.).—Provincial meet of the R.A.C. at Hereford.
Essex C.A.C. gymkhana at Brentwood.
- 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
- 18th (Sat.).—Annual Gymkhana of the Herts C.A.C. at The Grove, Watford, by permission of the president, the Earl of Clarendon.
Meet of the Liverpool and Cheshire A.C.'s at Delamere.
New Forest and Dorset A.C.'s joint hill climb.
Hill Climb of the Essex C.A.C.

ALLEGED POLICE OBSTRUCTION.

At the hearing, at Barnet, on the 29th ult., of the case of Joseph Hewens, a motor scout, summoned for obstructing the police in their duty, Mr. Muskett, on behalf of the Police Commissioner, suggested to Mr. Kemp, K.C., who represented the Automobile Association, that the practice of the Association in working in direct opposition to the police should cease, and that some kind of co-operation should exist between the Association and the police.

Mr. Kemp said that the instructions of the Association to the men were to render the police all reasonable assistance. And they had even gone further than that; there was actually an instruction given to the men that they were not to obstruct within the measured parts of the road. When the incident with the defendant at Pricklers Hill occurred, the Association felt they were bound to deal with the matter promptly. So an inquiry was held by the Chairman of the Association and the solicitor and they found that the defendant had deliberately broken the rules. Under these circumstances they felt that they had only one duty, and that was to dismiss the man. The matter was brought before the Association, and dealt with by them, long before the police summons was taken out, and they acted only on the information given by the defendant himself. There should be no friction, no antagonism, between the Association and the public; they should work together for the benefit of the public. The defendant was fined 10s. and costs.

BUSINESS NEWS.

It will be remembered that a fleet of five Mercedes cars were placed at the disposal of the German Emperor during his visit to Corfu. We learn that His Majesty has decided to purchase the five vehicles, thus conferring on the Mercedes yet another mark of his appreciation of its merit.

MR. ROWLAND WINN has now got his new garage in full swing. It includes ladies' and gentlemen's retiring rooms, chauffeurs' room, &c. This is in addition to the showrooms in Albion Street, Leeds.

A FIRE has occurred on the premises of the Motor and Tyre Manufacturing Company, in Cleveland Road, Wolverhampton, by which considerable damage was done. Fortunately, however, the flames only reached part of the store rooms, cutting rooms, office and laboratory, and were prevented from reaching that part of the premises where inflammable material was stored. The fire has not interfered with the output in any way, and the firm, whose damage is covered with insurance, can continue to execute all repairs in the same time as previously, namely, within three or five days.

THE Countess Alberti recently took delivery of a very handsome 40-h.p. Itala limousine from Itala Automobiles, Limited. Her ladyship reports that the car has already done some very hard work and is marvellous in taking hills.

THE R.A.C. has just issued its certificates in connection with the standardisation test of three Cadillac cars. The certificate confirms the average speed of thirty-four miles over a 500 miles run after dismantling and re-erection, and states that the parts were found to be a proper fit, without undue slackness.

THE joining up of cut lengths of the outer wire of the Bowden mechanism becomes a very simple and quickly performed operation if the special double-ended adjustable "stop" supplied by the Bowden Syndicate is used for the purpose. The mechanism is now so extensively used by motor manufacturers and repairers that this little hint will no doubt be acceptable, more especially as the cost of the "stop" is but trifling and ensures a neatly finished job.

No less than eighteen motor-cars, draped in sombre black, and carrying friends and mourners, followed the hearse which carried the remains of Mr. Joseph C. Kennedy to the cemetery at Butte, Mont., U.S.A. The deceased had been a prominent member of the Butte Automobile Club.

THE large supplies of rubber that have come forward during the last few months have enabled a reduction in the price of tyres. Messrs. David Moseley and Sons, of Ardwick, Manchester, whose special motor tyres have long demonstrated their excellence, are giving the purchaser the advantage of reduced prices—a piece of pleasant reading, especially as we are able to assure readers that the quality of the production is maintained at the previous standard.

WE learn that Mr. F. Eason, of the late firm of Messrs. Sternberg and Eason, is making arrangements to continue the British agency for the Buick car. For the present year he will make a speciality of the new 15–20-h.p. four-cylinder model, which is built on European lines, and, fitted with a three-seated body, forms a speedy, racy-looking vehicle. Arrangements are also being made to carry a stock of spare parts for the Buick cars already in use in Great Britain.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, MAY 16, 1908.

[No. 480.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE Surrey County Council, which has had applications for the reduction of the speed limit of motor-cars from no fewer than sixty districts within its area, has decided to apply to the Local Government Board for orders limiting the speed of motor-cars to ten miles an hour in specified parts of each of the following nine places, viz., Walton-on-Thames, Hersham, Woking, Farnham, Hambledon, Godalming, Leatherhead, Croydon, and Merton. Evidently the popularity of police traps has waned, and many of the local authorities are now seeking to harass motorists by securing the imposition of a speed limit. This, if adopted, will be the cause of leading many motorists into the local police courts. Of course, in the places scheduled there are undoubtedly highways included where a speed of even five or six miles an hour is as much as can be safely done. But the whole question merits the serious consideration of the motoring authorities in conjunction with the local automobile clubs, and it might be well to come to some agreement as to the streets and roads where the limit might not be opposed if the authorities could be induced to give concessions where local zeal in the application has not been tempered with discretion.

Motorists No Worse Than Other Men.

A NORTHERN correspondent has some straight words to his fellow-motorists in our columns this week. We publish them because we believe the greatest good can result to the motor movement as a whole by the frank facing of unpleasant matters rather than by the policy of ignoring, or seeking to ignore, whatever tells against the case for the motorist. At the same time we are inclined to regard the experience related as somewhat exceptional. A lengthened experience of travel on all the roads of the country, and at various seasons of the year, leads to the conclusion that motorists as a body are no better or worse than any other section of bipedal persons mounted on wheels.

Footpaths on the Highway.

IN view of the many accidents that have occurred in both East and West Sussex during the present year in which motorists and pedestrians have come into conflict, Mr. A. Burtenshaw gave notice to move at Tuesday's meeting of the East Sussex County Council "That in view of the increase in the motor traffic on the main roads in East Sussex, and the consequent danger to foot passengers on these roads, it be an instruction to the Roads and Bridges Committee to provide suitable footpaths adjoining the main roads in populous places where danger exists, without requiring any contribution from the locality." There is no doubt that the proper demarcation of the footpaths and the highway is a practical point that the councils and authorities should seriously consider, otherwise these accidents are likely to increase in number. Very often additional safety could be given the public by merely preventing the overgrowth of hedges that seriously encroach upon the width of the highway. The councillors, however, scarcely took the matter seriously, and it was also opposed on the ground that

it would involve the Council in very heavy expenditure. Mr. Gwynne, who is chairman of the Eastbourne Rural Council, suggested that shelters might be provided on the telegraph poles for people to take refuge in when motors were passing, and, after that, the motion was lost by a large majority.

No Motor Roads this Session.

WE have never been enamoured of the proposals made from time to time to establish motor roads leading from London to places of popular motoring resort. It seems wholly undesirable to seek a differentiation between motor and other traffic, whether in Budget proposals or the ordinary rights of the road. The conveyance of persons and parcels and the delivery of goods of all kinds are absolutely necessary, and if there is more wear and tear associated with one class of locomotion than another, the community gain in the saving of time. Last week we were able to briefly record the intention of the promoters of the London Motor Roadways Bill not to proceed further with their proposals for legislation. Following the Bill introduced in 1906 to construct a motor road between London and Brighton, which was promptly withdrawn, two projects were embodied in private Bills lodged before the beginning of the present Session. Of these the London and Windsor Motor Roads, Tramroads, and Tramways Bill was the more important, but memorials alleging non-compliance with the Standing Orders were numerous, and as they were upheld, the project was dropped at an early stage. The other measure, although to some extent a competing enterprise, was much less ambitious. It proposed the construction of a motor road from Hammersmith to a junction with the Bath Road, near Eton, at a cost of fully half a million sterling. The promoters have apparently met with some difficulties, and, as we have said, nothing more will be heard of it this Session.

Club Challenge at Brooklands.

A CHALLENGE has been issued by the Nottinghamshire A.C. to all British automobile clubs, which is open until the 27th and is to be run off under the racing rules of the Brooklands A.R.C., to which body acceptances are to be sent. Should the challenge be taken up the event will be contested on some Saturday in July. The conditions laid down by the Nottinghamshire A.C. are that each competing club shall nominate a team of five cars, respectively suiting the following five standards of the R.A.C. touring standards, viz., Standard Three, equal to 16-h.p.; Four, equal to 20.8-h.p.; Five, equal to 25.6-h.p.; Six, equal to 32.4-h.p., and Seven, equal to 40-h.p., all R.A.C. rating. The cars must be owned and driven by members of the challenging and accepting clubs, but the owner of the car need not necessarily be the driver. The competing clubs will be responsible for their teams containing no car that is owned, driven, or entered by a person having a direct interest in the motor or accessory industries. Five races will be run between the clubs for the five classes already mentioned. The first car past the post in each race will constitute a win for the club to whose team it belongs, and will score twenty points to such club; the second car past the post in each race will score ten points to the club to which it belongs. The club scoring the larger number of points in the five races will be declared the winner. The distances of

the above-mentioned five races will be for Standard No. 3, about 5 miles; No. 4, about $7\frac{1}{2}$ miles; No. 5, about $10\frac{1}{2}$ miles; No. 6, about $14\frac{1}{2}$ miles; No. 7, about $18\frac{1}{2}$ miles.

The Force of Habit.

A GOOD story was told us at Nottingham that when the King was recently visiting one of the great homes in the Dukeries, the Chief Constable of the County ordered the police to disappear behind hedges, or anywhere else, as soon as the Royal motor-car appeared in sight—owing to His Majesty's known objection to being conspicuously guarded. After waiting some time the constables saw an automobile approaching which one and all mistook as the Royal vehicle. They fled helter skelter, like awkward and overgrown rabbits, "to cover," to the consternation of a passing motorist, who stopped the next car to inform the King that he was in a trap. Familiar with our southern roads, he had come to regard the presence of a blue line in a green hedge as sure sign of danger to those who drive cars. As a matter of fact, Nottinghamshire has never yet possessed a police trap, the authorities relying on the section of the Act which deals with reckless and furious driving to secure the safety of the public.

A Suggested Up-to-Date Method of Visiting the Royal Academy.

Motor Taxation and the Budget.

A MONTH ago we referred to a speech by Sir John Bell, Lord Mayor of London, in which, touching on the question of motor-car taxation, he trusted that the Government would not penalise the rising automobile industry, for assuredly it would be undesirable for legislation to check its progress in any way. On the same occasion, Mr. E. Manville, as president of the Society of Motor Manufacturers and Traders, declared it was the opinion of that organisation that to tax methods of locomotion, particularly when one class was singled out from the others, was against all traditions of public policy. This view was to the effect on the industry of any further taxation was one that motorists quickly saw should be kept well to the front. To take it for granted that Mr. Asquith really intended to carry out the hint that he gave when introducing last year's Budget, and to suggest that the increased revenue should be ear-marked for a specific purpose, did not commend itself to many who have followed the course of legislation on this matter. This is more especially the case in view of such statements as that made with much authority at the last meeting of the Warwickshire County Council, when it was pointed out that the income from motor-car licences, fees, &c., did not come to one twentieth of the increased cost of roads as compared with a few years ago. There was just the danger that if the Chancellor of the Exchequer accepted the proposition that increased taxation was to be devoted to the maintenance of roadways, he might be tempted to raise it to such a point that it should cover the

entire cost—a course which would have been almost inimical to the existence of the industry. Fortunately those who attended the House of Commons on Budget day expecting to hear the Premier propound a new scheme of motor taxation came away with the knowledge that motor-cars had not been mentioned in any of the financial proposals put before the House of Commons. Although we have thus escaped the imposition which in some quarters was supposed to be threatened, motorists must maintain the position that the majority have taken up, viz., that no further taxation on motor-cars, as distinct from other classes of traffic, should be permitted to endanger the future of the industry. This is the logical, and, as events have proved, the safe course to pursue. We trust the future will be kept clear of any hints to Mr. Lloyd-George as to how to allocate further taxation.

Manchester and Motor Vehicles.

FOR some time past there has been a good deal of agitation concerning the refusal of the Manchester Watch Committee to grant licences to any motor-buses. That was a couple of years ago; and great improvements have taken place in these vehicles since then. On the Manchester City Council agenda for May appeared the following notice of motion:—"That the Chairman of the Watch Committee having stated, at the meeting held on April 16th, 1908, that 'the policy of the Committee is not to licence any motor-omnibus whatsoever,' this Council considers such policy narrow, unprogressive, and altogether unworthy of the traditions of a great city, whose province it should be to stimulate inventive genius and to foster industry; and hereby instructs the Watch Committee no longer to ignore applicants for licences, nor to refuse to even look at what may be presented to them as the latest types of such class of vehicle." A sub-committee of the Watch Committee has been appointed to go into the whole matter, and hopes are entertained that reasonable counsels will prevail. In the matter of motor taxicabs Manchester, too, has scarcely been to the fore, only a very few so far running in the streets. However, this condition of affairs is to be changed, for on Monday the first of forty motor "taxis" was licensed. The "taxi's" up to now have been allowed to charge only the ordinary horse-cab fares, but for the new "taxis" the charge will be 1s. per mile (no matter whether the number of passengers be one or four), and *pro rata* for a third of mile. Other cabs may charge double fares between 12 midnight and 7 a.m., but the Provincial Company agree to charge the same fare as above by night as well as by day.

A Sixpenny Fine.

APPARENTLY the warm welcome that Ireland extended to motorists in the Gordon Bennett year has not spent itself. At the Omagh petty sessions a local motorist has just been summoned for driving a motor-car on the public highway without a licence on April 18th, and also on May 2nd. The complainant said the defendant had no licence since December, 1906, but he knew he should have one. The Bench imposed a nominal fine of 6d. in each case with costs. Such moderation does credit to the magisterial Bench.

Towing Dangers.

A FEW weeks ago we wrote of the danger that was being experienced in many towns, notably Sheffield, owing to the lack of adequate means of signifying the fact that one car is towing another, and invited readers to secure discussion of the matter. We are glad to know that it received close attention from the general committee of the R.A.C. at their meeting on Saturday. After discussion they came to the agreement that it was impracticable to adopt any particular signal to indicate the fact that towing was in progress, but it was felt that if the length of rope between the two cars was limited to ten feet, and both side lights were carried on the second car the

danger would be obviated. We commend the notion to those of our readers who may have occasion to use the tow rope.

Motor-car Imports and Exports.

APRIL proved an extremely quiet month as far as imports of foreign motor-cars and parts into this country are concerned, a decrease, as compared with April, 1907, of no less than £143,345 being recorded. Of complete cars only 480 were imported during the month, of the value of £186,817. The number of chassis imported was 228, valued at £75,200, while parts were responsible for £122,136, giving a combined total for April of only £384,153, as against £527,498 in the corresponding month of last year, and £403,229 in 1906. The gross imports of cars (1,591 in number), chassis (973), and parts during the first four months of the current year amounted to only £1,382,216, as contrasted with £1,692,265 in the corresponding period a year ago. Turning now to the section relating to the exports of British automobile productions, these show a slight increase—from, in the aggregate, £92,483 in April, 1907, to £98,371 last month. Altogether 168 complete cars

Horace Plunkett represent Ireland. The Hon. Arthur Stanley Sir Henry Norman, Major Leslie Renton, Mr. A. E. Mason (the member for Coventry), Mr. T. D. Berridge and Mr. C. E. Shaw are the remaining six members—all M.P.'s—of the committee, which is thus representative and influential. This committee can exercise a great influence on the future of the movement, and all will feel that it will be both watchful and wise in the general interest.

Horns V. Whistles.

WHAT shall be the distinctive sound to distinguish the approach of a motor-car? In the early days the horn had a monopoly so far as the automobile was concerned, but latterly there has been a growth in the number of ordinary cyclists employing the same device to acquaint the world of their coming. The committee of the Sheffield and District A.C. are calling the attention of local people to the matter as one of some importance, "as they are of opinion that the element of danger to the pedestrians on the road would be greatly reduced

The First of the Panhard Racers for the A.C.F. Grand Prix Contest.

(£58,246) and 18 chassis (£7,473) were despatched from this country in April, as well as parts to the extent of £32,652. The gross shipments during the four months ending with April are returned at £409,499, which contrasts with £408,085 in the first period of last year.

A New Legislation Committee.

DESPITE the attractions of last Saturday's meet at Nottingham, some really sound work was done by the General Committee of the R.A.C., and the appointment of a strong and influential Legislation Committee charged with the important duty of organising and conducting the campaign in regard to future legislation and to deal with all matters in connection with the administration of the law at present in force will have the approval not only of the members of the Club but of the 12,000 associates. From every point of view the selection is admirable, and, although the name of Mr. C. D. Rose, M.P., does not appear in the list, we opine he is an *ex officio* member by reason of the high office he holds in motoring circles. Lord Montagu represents the Lords; Sir John Macdonald will voice the views of Scotland, and Sir William Goff, Bart., and Sir

if the bell only was used to denote the approach of a pedalled cycle." It is interesting, too, to note that motorists are not so universally favorable to the motor horn as was formerly the case, and the penetrating sound of the whistle now awakens sleepy carters, and calls to drowsy carmen to get to their own side of the road. Is the utility of the whistle partially due to the novelty of the note?

Sunday Motoring.

THE Rev. Prebendary Eardley Wilmot, who presided at the annual meeting of the Lord's Day Observance Society, in the Westminster Palace Hotel, on Tuesday, said that he looked with great anxiety at the present ways of spending the Sabbath, and he attributed them largely to three causes—the bicycle, the motor-car, and the week-end. The coachmen, who had now become chauffeurs, had more arduous duties than in the old days, when horses were used, and, as the machinery of their cars required the closest watching, they were quite unable to attend public worship when they took their masters and mistresses out. It would be interesting to have the view of the motoring bishops on the subject.

Motor Meet at Nottingham.

NOTTINGHAM, both county and city, has always shown motorists an open road—a road with a good surface unobstructed by blue stops, and not hedged by watchers and other instruments of policescraft. When the motor movement had to organise for its own protection in the early days the motorists of Nottingham were the first to associate together and to affiliate with the A.C.G.B.I.—as the R.A.C. was known until Royal patronage gave it a premier place among the societies of encouragement in this country. The Nottinghamshire A.C. has always taken its objects seriously. It is a combination of good sportsmen who have sought to influence public opinion, not by organising processions through the streets and throwing dust in the eyes of the public, but by means of lectures in the winter and well-timed demonstrations in the summer. It has 250 members, including the leading gentry of the county and the chief men of the city. At the present moment an effort is being made to gain fair conditions for the motor-cabs which are about to ply along the tram-lined streets. There are few towns in the

meets this year it was fitting that the first of the series should be held in the county of Robin Hood. This took place on Saturday with regal weather, ducal invitation and civic welcome to give distinction to the proceedings and pleasure to the participants.

The day's proceedings began with a reception of the General Committee of the R.A.C. by the Mayor (Mr. J. T. Spalding, J.P.) and the Sheriff (Councillor W. H. Carey), who testified to the friendliness of the authorities towards all who motor. Suitable response was made by Mr. Robert Todd, and then Capt. H. H. P. Deasy acted as chairman of the committee which quickly got to business. A Legislation Committee was appointed to deal with all matters in connection with the administration of the law as well as with any possible amendments. The Legal Committee also reported action in connection with several matters affecting the interests of members of the R.A.C., one of the most interesting being concerned with an arbitration in regard to the liability arising out of a collision between the cars of two members. Several other subjects were

The R.A.C. Provincial Meet at Nottingham.—Some of the cars drawn up in front of Welbeck Abbey.

provinces so difficult to negotiate as Nottingham, for the people seem to regard the space between the tram-lines and kerb as especially their own, and the standards in the centre of the roadway have constituted a menace to the safety of strangers who motor through the place. On this subject urgent representations were made by the club some time ago to the Corporation, and the work of removing the standards is now proceeding. Already the authorities have taken them from about one mile's length of the streets, and they are shortly to be shifted from the road that leads to Mansfield and Welbeck. In a couple of years the city will be free of such road obstructions. These examples of good work done by the Nottinghamshire A.C. show that motoring organisations can be of use to local authorities, who would often gain by taking similar organisations into their confidence when dealing with matters of road improvement and traffic regulations. Certainly by the careful development of this policy the Automobile Club of Nottingham has become recognised as a local institution of much importance. City magnates delight to take part in the festive proceedings, and the Chief Constable would be grieved were he to have to bring a charge against a member of the club, even if it were so simple an offence as the absence of a rear light.

Just as the club was the first to affiliate with the central organisation, so when the R.A.C. determined on a trio of provincial

discussed, and votes of thanks to all who were concerned with the welcome to the club were adopted, Mr. Charles Hardy responding.

The main feature of the day was the run to Welbeck, and early in the afternoon a number of cars left the city of Nottingham for the twenty-five miles drive to the Duke of Portland's place. For some distance the road was tram-lined, and the presence of considerable heavy traffic necessitated careful driving on the part of those who made the journey through Mansfield to Welbeck. The cars entered Birklands from the Mansfield Woodhouse and Edwinstowe roads, after passing Warsop Windmill. The drive was through the Long Avenue, where great oaks and birches were springing into their new beauty. We passed the famous log hut now used as a shooting lodge, and disturbed the game which frequently rose above the bracken on either side of the drive. Welbeck was reached by Norton on the Tile Kiln Wood road, beyond the Winnings—a group of delightful almshouses erected by the present Duke of Portland in remembrance of his winnings on the racecourse in 1889. Thus we arrived near the Wood Yard entrance to the grounds, passing on the way the well-built engine house, where were the steam-rollers employed for dealing with the roads on the estate.

In the courtyard many motorists from elsewhere were seen,

and more than 200 cars lined either side of the drive leading to the house. From Sheffield a goodly contingent of the local club arrived, having travelled through Mosbro' and Barbro' and *via* Cuckney. Amongst them were Messrs. Percy Richardson, G. D. Flather, R. Slack, and F. B. Cawood, the hon. secretary. Others participating in the event included:—The Mayor of Nottingham, the Sheriff, Mr. Chas. Hardy (president of the Notts. A.C.), Mr. J. W. Orde (secretary of the R.A.C.), Major T. H. Cochrane, Captain H. H. P. Deasy, Captain Bagnall-Wild, Major Robertson, Captain Longfield, Dr. E. Solly (Harrogate), Messrs. R. S. Clifford, jun., A. McAlpin (hon. secretary of the Leicester A.C.), Granville Kenyon (hon. secretary Kent A.C.), R. Todd (chairman of the Auto-Cycle Union), R. B. Bagnall-Wild, E. Powell, E. P. Hooley, F. Lindus Forge, C. Wicksteed, H. Bircumshaw, R. M. Wright, H. Belcher, A. R. Atkey, P. L. Huskinson, P. S. Clay, E. Manville, F. Coleman, and Booth Granger (hon. secretary of the Notts A.C.).

In little groups we wandered through the chapel and the library, where the old fireplace attracted the attention of Mr. J. W. Orde, apparently thoughtful of the comfort of his clubmen when they get to Pall Mall. Thence a few steps led the way to the underground picture galleries and corridors—the walls of the latter covered with great pictures of horses fearfully and wonderfully limned—to the whilom ballroom, now a spacious picture gallery, 160 feet long, 64 feet wide and 22 feet high. This is lighted by octagonal skylights, and its walls recall the ancient heroes of the great families of England. Ascending, the orangeries and gardens were inspected and a visit paid to the Riding School and stables, the latter covering an acre of ground and the former of a size and capacity for a motor garage when there is no longer any use for the tan floor that now gives opportunity for horse exercise in wet weather. In fact, it has already served such a purpose, and on the occasion of the Welbeck ball 300 cars were housed within its spacious walls—and still there was room.

The return to Nottingham and other destinations was made in no ordered manner, and when the motorists had entirely depleted the local Post Office of its stock of picture postcards, they set their engines going and made good running on one of the most charming afternoons of the spring.

And then, in the evening, there was a dinner at the Victoria Station Hotel by invitation of the Nottinghamshire A.C., when speeches were commendably brief and congratulatory. Mr. Charles Hardy was in the chair, and there were about a hundred guests. After the loyal toasts and that of the Duke of Portland had been greeted with acclamation, Mr. E. Manville proposed the "City and County Authorities," paying well deserved tribute to all concerned. Responses were made by the Mayor, Mr. R. B. Bagnall-Wild, and Mr. P. S. Clay, the Chief Constable of the city, and then, in proposing the health of the chairman, Mr. J. W. Orde referred to the fact that no additional tax had been put on motors by the Chancellor of the Exchequer. He said that Mr. Asquith invited the Royal A.C. with others to send a deputation to him in a private capacity. As a consequence, resolutions were submitted to the club and unanimously passed. The results of that conference and these resolutions were seen in the Budget, and he believed that in future, before any Chancellor proposed to put a tax on motor-cars, the club would have an opportunity of making its voice heard.

NEAR the Earl's Court Railway Station, London, S.W., the Earl's Court Motor and Garage Company have a well-designed establishment for the storage of the motor-cars of visitors to the great London exhibitions this year, and also a well-equipped repair shop for carrying out repairs to cars, &c. Their stock-rooms of spare parts are replete with everything that is likely to be required by motorists seeking assistance, and they have large stores of petrol, oil, &c. In addition to their garage business the company, of which Mr. A. Powell is the managing director, with Mr. A. W. Hemmings as manager, hold the agency for the New Pick car, which was described in our report of the new vehicles at the Cordingley Motor Show

A NEW TYRE MANIPULATOR.

MOST motorists have at one time or another experienced difficulty in getting the valve into place when replacing the inner tube of a motor tyre, or of fixing the security bolts after changing a cover. Various tools have from time to time been introduced to facilitate the operation, one of the latest to come under our notice being the manipulator which has lately been put on the market by Messrs. Evan Jones and Sons, motor engineers, Bangor Street, Carnarvon. As will be seen from the accompanying illustration (Fig. 1), it consists of a stout steel tube, bent to a special form, and having a slot in its

Fig. 1.—The Jones Tyre Manipulator.

working end by means of which a secure hold is obtained on the bead on one side of the rim. Pivoted to a slide on the tube are two steel hooks, by means of which one side of the tyre cover is gripped. The method of using the manipulator is clearly shown in the second illustration; the operator stands on the inside of the wheel, and, owing to the great leverage, is able to pull the cover right over without undue strain, to enable the valve stem and the security bolts to be readily withdrawn and reinserted. Before putting the device on the market Messrs. Jones have submitted it to extended trial in their garage, where they find it a very useful adjunct. By its use not only is the work greatly facilitated, but there is no risk of damaging the beading or

Fig. 2.—The Method of Using the Manipulator.

nipping the tubes. The position of the slide to which the hooks are attached can be varied as desired, rendering the tool adjustable to suit different sizes of tyres.

MR. JOHN BURNS intends, in the absence of motor-car legislation this session, to renew the Motor Car Act for another year by including it in the Expiring Laws Continuation Act.

WE are glad to find that the L.C.C. has improved the arrangements for the issuing of registration numbers and driving licences at its offices at Spring Gardens, S.W. Formerly the inquiry office was on the third floor, necessitating two journeys up and down the lift each way. The office is now situated practically on the ground floor close to the cashier's department, so that much valuable time is saved.

GOSSIP FROM PARIS.

MADemoiselle Gaby POHLEN is a happy woman. She has obtained her driver's licence to drive a motor taxicab from the Prefecture of Police. She has, however, a yet higher ambition. She wants to drive a car in a big automobile speed race. Mademoiselle Gaby Pohlen is no ordinary woman. In addition to being good-looking and under thirty, she can boast of having vied with men in their sports ever since her girlhood. She mounted a bicycle as soon as they were invented, is a good horsewoman, can beat most people in walking, has ridden camels in Algeria, in the Biskra region, and loves deep-sea fishing. I learned all this and much more the other day when I was her fare. We became good friends almost immediately. As soon as I had taken my seat in her taxi-auto she turned round—while at the same time keeping a sharp look-out and driving with skill—to say she knew me very well from having seen me riding a bicycle constantly during the last ten years. She had given up that exercise long ago, and wondered I had not done the same. Opening her heart to me, she said she was very happy now, but what trouble she had had! Not to get her driver's licence—that had been easy enough, for she had taken the steering-wheel as early as 1902. Her tribu-

Mdlle. Gaby Pohlen at the wheel of the Motor Taxi-Cab she has lately been licensed to drive in Paris.

lations began when she had the coveted document in her pocket. She presented herself to almost all the people who had motor-cabs in the Paris streets, but one after the other they rejected her application. When, after so many rebuffs, she was at last accepted she was almost astonished. That is only a couple of weeks ago, but her example has already been followed by Madame Decourcelle. The Paris women cannot complain that the Prefect of Police does not put them on an equality with men. He encourages them to mount the box of ordinary cabs, and is now allowing them to take the steering wheel of motor-cabs. If they all drive as well as Mademoiselle Gaby Pohlen and Madame Decourcelle the public will have no reason to complain.

WHO will win the Grand Prix of 1908? This question is greatly exercising the minds of all sorts of persons—the makers of the racing cars, the drivers, the sporting journalists, and everyone who in one way or another is interested in automobilism, to say nothing of the betting public. One of the Paris daily sheets devoted to sport has already opened a competition with money prizes, varying between £10 and £1, to be awarded to the persons who may before the race indicate most correctly the name of the driver that will establish the record of the shortest time occupied during the race in covering the circuit, measuring seventy-five miles minus only a few yards. The record last year was 36 min. 16 sec. The person spotting the driver and giving the exact time of his record, or the nearest to

it, will have the first prize. There are twenty French and twenty-five foreign cars duly inscribed for the race, and it is almost certain three Mors vehicles will be added to the French list. I know many Frenchmen who would willingly back the French cars against their foreign rivals, but I think their confidence must be inspired by patriotic sentiments, as they cannot know much about them. As usual, the French makers are particularly behindhand, and their drivers who tried the circuit before it was closed against the racing cars on May 1st did so almost without exception on last year's cars. They will not have his new Brasier car till the end of this month, the Renault car is not yet finished, nor the Lorraine-Dietrich, nor the Motobloc. One of the three Panhard cars was brought out and photographed a few days ago, but the other two are still unfinished. The Bayard-Clement was the only new French racing car which was ready in time to be tried on the circuit. On the other hand, most of the new foreign cars, especially the Fiat, the Benz, and the Mercedes, have been in the hands of their drivers several weeks. That should give them an advantage in the race. At any rate, they constitute a formidable trio of foreign competitors, to say nothing of the Austin, the Weigel, the Opel, the Thomas, and the other foreign racers, each of which may well aspire to win the day.

THERE is no immediate prospect of the disturbance of European peace, which seems to be doubly guaranteed by the Anglo-French *entente cordiale* and the triple alliance. But French automobilists do not much like the Bill just presented to the Chamber by the Government for the requisitioning of their motor-cars in time of war. They know it is natural and right that the State should be empowered to seize as many self-propelled vehicles as may be required by the army in case of national peril, but it can be easily understood that the owners of cars which cost £1,000, or, perhaps, £1,500, would prefer not to have to make the sacrifice. It is true the Government would compensate them for it by a price stipulated beforehand, according "to the type of car and the date of its manufacture," but everyone one in France knows what such a valuation is. However, as every deputy who should oppose it would be taxed with want of patriotism, the measure will most surely be adopted. In the case of the owner of a car failing to make the required declaration of his car between the 1st and the 16th January each year, he will be fined half the estimated value of the vehicle.

THE Paris police have not yet at their disposal armoured automobiles carrying machine guns, like their *confrères* of Chicago, but on the parade ground of Issy les Moulineaux motor-cars were used by them to drive back the crowd on the occasion of the Delagrangé-Henri Farman aeroplane match. The extraordinary part of the business was that no one seemed to find it extraordinary. If the prophecy of Marquis d'Argenson, Louis the Fifteenth's Lieutenant of Police, is to be realised, and there appears to be a good prospect that it will be before long, his successor, M. Lepine, who has already created brigades of cycling police, automobile police, dog police, swimming police to rescue drowning persons, &c., will have to organise yet another brigade—that of aerial police. In his memoirs, edited by one of his descendants and published in 1858, Marquis d'Argenson said he believed the art of flying would be discovered in his century. He miscalculated by about a couple of hundred years, but it is quite possible, if not certain, there will be, as he predicted, "aerial armies." Writing in 1720, he foresaw "Our present fortifications will be useless. The safety of our property and the honour of our wives and daughters will be in jeopardy till the police of the air has been organised to cut the wings of the aerial ravishers and bandits. It will be necessary to add another department to the Government by creating the Ministry of the Aerial Forces." Marquis d'Argenson seems to have imagined the flying business would be done principally by Don Juans and robbers. He may, however, be pardoned that error, for he was not the inventor of the aeroplane but of the "lettre le cachet."

MARNEY.

NOTES FROM BUXTON.

BUXTON is suffering just now from the calm which usually succeeds the storm. The spurt of activity brought into being by the Easter holidays was all too brief, and has long since subsided, giving place to a period of dulness little better than that experienced in mid-winter. The hotel proprietors and others dependent upon the patronage of the pleasure-seeking public are, however, looking forward hopefully to the arrival of the Whitsuntide holidays to effectually dispel the quietness for the remainder of what is usually referred to as "the season," which means practically from Whitsuntide to the beginning of October. True, the "toot-toot" of the motor-horn is more frequently heard in the land than was the case during the winter months, and, although the owners are for the most part birds of passage, as it were, their presence helps to relieve the monotony of existence at a time when hotel staffs frequently outnumber the guests.

◆ ◆ ◆
To the Buxtonian pure and simple,

Derbyshire born and Derbyshire bred,
Strong 'ith arm and weak 'ith head,

there is no other place on earth which offers so many varied attractions to the tourist, whether he be geologist, botanist, artist, antiquarian, or even the ordinary business man seeking rest from the cares and worries of the office, as does the Spa of the Peak, with its verdure-covered crags, rippling streams, and well-wooded slopes, the theme of many a poet's pen and of many an artist's brush, to say nothing of the tumuli, relics of the Roman invasion, which abound in the immediate vicinity.

◆ ◆ ◆
BUXTON, in what one often hears referred to as the "good old times," was a stopping-place for stage coaches plying between London and the north, and now that the old order has changed and yielded place to the new, it appears to be equally popular with the motorist, as during last week-end at the Crescent Hotel alone there were garaged over a dozen cars, representing Cornwall, Nottingham, Sheffield, Chester, Manchester, and Midlothian. Visitors to the Palace Hotel who brought their own cars included Lord Burton and Lord Llangattock, these being the only two whom the book-keeper could single out from the other guests staying at the hotel. The Empire—Messrs. Spiers and Pond's palatial hotel in Park Road—is closed during the winter months and does not open its hospitable portals to the wayfarer before the last week in May or the first week in June. This hotel possesses garage accommodation for about twelve cars of the largest size, and is fully occupied during the summer months.

◆ ◆ ◆
THE proprietors of many of the hotels and hydropathic establishments in the town do not provide any garage accommodation at all, but there is provision in abundance of a public character, notably Messrs. G. W. Hodgkinson and Sons, the Buxton Garage, in the Market Place, near the Town Hall, capable of accommodating fifty cars; the Great Livery Stables and Garage, near the railway station, with accommodation for about twenty-five vehicles; Mr. G. Sims, Eagle Parade Garage; Messrs. Pyle and Son's garages in Ash Street and Compton Buildings, London Road; and Messrs. Cook and Son, Railway Hotel, Bridge Street. It will thus be seen that in only very exceptional circumstances will the motorist visiting Buxton experience any difficulty in finding a place in which to house his car.

BUXTONIA.

MR. CHATTERTON having offered to conduct a series of lectures on Esperanto to the members of the Auto Cycle Union, has been accorded permission by the committee of that body.

LAST week the Ironmongers' Federated Association held a conference at Nottingham and on the Friday lunched with Messrs. Humber, Ltd., at their works at Beeston, where Mr. Edward Powell, chairman and managing director, received the visitors.

SOME CURRENT TOPICS.

The Setting of Valves.

The attention which has recently been devoted in the pages of the *M.C.J.* to the important question of the setting of the valves of petrol motors has given an impetus to a more serious study of the subject, not only in this country but also in America and on the continent. One of the leading technical motor papers in France, "Omnia," has just gone very deeply into the subject, and in addition to dealing very fully with the ingenious instrument brought out by Larrad's Patents Syndicate, has copied the *M.C.J.* example of getting together particulars of the valve setting of the principal motor manufacturers in France. Pressure of space prevents the reproduction of the whole of these, but it may be useful to give the average practice in France as based on thirty different engines. This works out as follows:—Inlet valve, opens late 12 deg. 16 sec., and closes late 25 deg. 32 sec., exhaust valve opens early 46 deg. 20 sec. and closes late 12 deg. 16 sec. The writer in "Omnia" is apparently unaware that, in addition to their timer, the Larrad Syndicate have brought out what is known as a degree instrument, which may be used to check the synchronisation of the valves in accordance with any setting.

The 58-h.p. Daimler Car, with Hooper body, lately delivered to King Edward.

Wind Screens Galore!

Since a wind screen on a touring car has practically become *de rigueur* the range of types offered to the motorist has increased with such marvellous rapidity that the task of selecting a suitable one has become almost as worrying a question as settling one's life assurance! At the recent Cordingley Show there were nearly a dozen different patterns on view, and these do not by any means exhaust the list, each possessing particular points of merit. Notwithstanding the fact that wind screens do slightly reduce the speed of a car, this is far outweighed by the added comfort they give to motoring—in summer by protecting the driver and passengers from dust and from the myriads of flies and other winged insects, which, when they get in the eyes, often cause acute pain, and in winter in shielding one from the piercing wind. Early this year a long run that I had on a six-cylinder car on a bleak frosty morning proved, owing to the excellent screen fitted, much more enjoyable than was anticipated. Not only was it possible to engage in conversation without having to constantly strain one's lungs in order to be heard, but a cigar or pipe could be indulged in comfortably. As regards the drawbacks to glass wind screens, a serious one is, of course, the danger of broken glass in case of accident, while another is the misleading effect of the rain when travelling at night in wet weather. The first-named difficulty has fortunately not proved so prevalent as many at first feared, while the other has been practically overcome by the introduction of the divided or folding screen, which, while protecting the driver to a certain extent, does not interfere with his outlook.

ARCANUM.

THE NAPIER CONTROLLABLE CARBURETTOR.

THE appended illustration shows some interesting details of the carburettor fitted to the 80-h.p. six-cylinder Napier car. It is known that difficulty is experienced with cars of high horse-power in obtaining maximum power combined with the ability to run slowly in traffic and to be economical in petrol consumption. The new controllable carburettor designed to eliminate these shortcomings has, we learn, proved extremely satisfactory in practice, enabling a 120-b.h.p. Napier to be driven quite silently and smoothly in the thick of the London traffic, and, moreover, without excessive petrol consumption. The outlet at the top of the jet seen at the left of the upper portion of the picture has a curved slot J, and, a short distance from it, a small hole K. On the top of the jet is fitted a moveable baffle cap L ground to its seat, and having in it a curved opening M corresponding to the slot in the jet. The cap is placed over the jet, held down to it by the spring shown, and is capable of being partly rotated.

The flow of petrol is regulated by the amount of exposure given to the slot in the jet by turning the baffle. Up to twenty miles an hour the little hole K, termed

the pilot; is the only aperture exposed; turning the baffle further gradually uncovers the curved slot to its fullest opening when the maximum power of the engine is required. The movement of the baffle is made to exactly coincide by mechanical means with the gas and air throttle by the lever on the steering wheel under the control of the driver. Simultaneously with the opening of the throttle and the exposure of the jet aperture air is automatically admitted, firstly, through the usual air inlet; secondly, as the speed of the engine rises, through the extra air valve operated by the water pressure acting on the hydraulic regulator, the mixture being adjusted exactly to suit the varying speed of the motor. It will be easily seen that the amount of petrol allowed to flow is no more than is actually required for the speed of the engine, and that no excess can get through or waste occur.

There are many other ingenious ideas embodied in the carburettor, a general view of which, complete with its hydraulic air regulator, is seen in the lower part of the illustration. B is the float chamber with the needle top seen in the centre of the cover, and the float agitator at its side. A is the gas outlet to the engine. C is the main air intake. D is the petrol filter fitted with gauzes. One of the special features of the carburettor is that it has an electro-deposited copper water-jacket, of which E¹ and E² are the inlet and outlet unions to pipes connected

with the water-circulating system of the engine. The air throttle worked by the hydraulic air regulator is shown at the upper right hand. F is the sleeve showing one of its three triangular apertures in which the plunger slides. The air is taken in the front end, and its supply to the carburettor is automatically regulated by the speed of the engine increasing or decreasing the pressure of water, which, in its turn, presses on a diaphragm. The diaphragm moves the plunger rod to which is attached the plunger. In the view shown it is half open, and in accordance with the speed of the engine this plunger slides in and out, opens and shuts the three ports, and automatically adjusts itself to admit the exact amount of air necessary for the rate at which the engine is turning.

The spring on the plunger rod is provided to control the pressure of the water, and the nut I is for the purpose of adjusting the spring to its requisite tension, so that the opening and shutting of the valve occurs at the correct moment.

SOME USEFUL NOTES.

It is well to make a practice of seeing that there is a plentiful supply of petrol on board when commencing a return journey. Nothing gives a motorist more confidence when he is miles from home, the roads are heavy, the country hilly, and the weather bad, than the knowledge that there is at least plenty of fuel available.

RUNNING backward is not recommended as a particularly fascinating form of sport, but it is a very good thing to be able to steer a car rear end first in case it becomes necessary, through the disablement of the forward gears or other accidental damage, to resort to this method. Occasionally something will go wrong on a hill, making a hurried backward descent necessary, or a hill may be met which is so steep that it can only be climbed on the low reverse gear.

THE hub brake mechanism is a part of the car which seldom receives the lubrication it should, for in some cases it is far from accessible. Oil is required on the pins supporting the brake shoes and upon the bearing points of the cams or toggle mechanism which actuate the brakes. These parts usually depend for their lubrication entirely upon the use of the oil-can, and as they see hard service they deserve good attention in this regard. Beginning at the operating lever, every joint in the brake rods occasionally requires oil, as do the bearings of the compensating shaft.

THE silencers of petrol cars become more or less coated on the interior with particles of carbon bound together with burned oil, and this not only insulates the walls so that the dissipation of heat is retarded, but in aggravated cases has been known to obstruct and choke the passages, and thereby seriously interfere with the proper working of the engine, sometimes causing a mysterious loss of power. A well-designed silencer is one that can be easily taken down and apart for the purpose of cleaning out. The carbon and oil deposits stick tenaciously to the inside, and washing out by ordinary means cannot be depended upon to clean them out, though in some cases it has proved helpful.

ONE of the most commonly neglected parts of a car, so far as lubrication is concerned, is the clutch operating mechanism. In the case of some multiple disc clutches, which are enclosed in oil tight cases, the oiling of the thrust collar and the lever which operates it is automatic, but in the case of many cone clutches, and, in fact, all that do not operate in an oil bath, the thrust collar and lever require oiling by hand. The duty of these parts is very severe, they being almost constantly in use in throwing in and out the clutch. Very frequent lubrication of the ball thrust bearing and of the end of the lever which actuates it is thus demanded. Not only so, but the bearing of the clutch pedal and the pins which secure together the clutch operating linkage should be frequently supplied with oil.

MR. NORMAN CROSSLAND has been appointed the Motor Union engineer for Manchester.

A PETITION against licensing motor-cabs at Harrogate has been signed by all the cab proprietors in the town.

MR. THOROLD A. STEWART-JONES, of Lewes, who was married last week to Miss Joan Holland, daughter of Admiral Holland, of East Horsley, is spending his honeymoon in a motor tour through the Lake District and Scotland.

MESSRS. DENNIS BROS., LTD., have secured an order from the Dunlop Rubber Company for a 2-ton van, and from the Barnsley British Co-operative Company for a 2-ton van (a repeat order), and for one 15-cwt. and one 25-cwt. van from Mr. Bracewell, of The Llaskett, Llandinabo, Herefordshire.

MESSRS. S. SMITH AND SON, LTD., the well-known makers of watches, chronometers, speed indicators, &c., have a splendid representation in the Applied Arts Palace of the Franco-British Exhibition. Their display includes watches, clocks, jewellery and silver plate of chaste design, and fully reflective of their reputation.

AT Machen, Mr. E. P. Steer, a cousin of Mr. Joseph Chamberlain, was married to Miss Bernice. A feature of the wedding was that the party rode to the church in nine motor-cars supplied by the Newport Motor Company. Later in the day Mr. and Mrs. Steer started on an extended automobile tour in the West of England.

AT Worcester a lad nine years of age has been fined for driving a motor-car without a licence. When stopped in the main street of the city he was accompanied on the car by a little girl about twelve years of age. The lad's father told the Bench that his son was quite competent to drive the vehicle, and had, as a matter of fact, done so for two years.

IT is the intention of the R.A.C. to hold a test of motor spirit, and on the suggestion of Mr. G. H. Baillie the matter is being thoroughly taken up by the committee. It is thought by many who have given the subject attention that the existing tests do not meet the needs of the user, and Mr. Baillie has devised a simple apparatus for testing the volatility of the fuel and its results compared with distillation curves.

THE London County Council has, in reply to a representation from the Stoke Newington Borough Council, expressed the view that no reduction of the maximum speed of electric trams to sixteen miles an hour is necessary within the borough. Numerous accidents are reported in the Kingsland Road, and the Stoke Newington Council have decided to inform the London County Council that the speed of the cars on this route often exceeds twenty miles an hour.

A COMPANY has been organised in Mexico to establish a motor-bus service in that city on lines similar to those in vogue in London. One of an order of ten Straker-Squire 'buses has already arrived and will be put in service during the present month. The vehicles are of the single deck type, with seating capacity for twenty-four people. The points to be served have not yet been definitely decided upon, but the initial service will probably be between the Zocalo through Colonia Juarez to Colonia Roma, and return. A trial may also be made later with a double-deck omnibus, and should this prove popular several of these will be placed in commission.

THE Hutchinson tyres are well known both in France and England, and the new list which comes from 13, Maddox Street, Regent Street, London, W., will be of interest to those who are giving serious attention to the tyre problem. This includes voiturette tyres in four sizes with round tread and car tyres with either round tread or of the grooved pattern. The Hutchinson non-skid is made of wood fibre and steel-studded treads, and deserves attention. A hint which is conveyed in the catalogue with regard to the inflation of tyres will be of general interest, including as it does the following approximate pressure table:—

| | | | | | | | | |
|----------------------------|----|----|----|----|-----|-----|-----|-----|
| Size of Section, mm. — | 65 | 80 | 85 | 90 | 100 | 105 | 120 | 135 |
| Minimum pressure, lbs. ... | 70 | 75 | 80 | 80 | 85 | 85 | 95 | 100 |

HERE AND THERE.

THE road over the Cairnwell is now open for motor traffic to Braemar, a point of interest to competitors in the Scottish Reliability Trials.

THE Essex County Motor Works, Ltd., of New London Road, Chelmsford, have been elected official country repairers to the Southend and District Motor Club.

AN application from a company desirous of running taximeter cabs having been received, the Scarborough Town Council resolved that they would licence taximeter cabs on the understanding that for each such cab licensed the company should purchase one hackney carriage already licensed.

DR. A. H. HEATON, president of the Automobile Club of Sedalia, Mo., U.S.A., has arrived in Paris for the express purpose of proving that motoring on the Continent need not be expensive. Dr. Heaton, who says he can automobile in Europe for an average of 19s. 6d. a day, and live well, is about to begin a six months' tour to give proof thereof on a Ford runabout. His itinerary includes France, Italy, Switzerland, Germany, Belgium, England, Ireland and Scotland, and he expects to average only about eighty or one hundred miles a day.

A 12-h.p. Star Car fitted with racing body recently supplied by the Star Engineering Company to the Hovian Engineering Company, Hove.

THE Mayor of Godalming has been urging motorists to keep the numbers of their cars as clean as possible; otherwise the local Bench may be inclined to inflict greater penalties in cases of inattention to this advice coming before them in the future than they have in the past.

WE give elsewhere the arrangements that are in hand for the holding of an inter club race meeting on the Brooklands track during the present season. It is settled that the competitors will be restricted to five from each club, and that the vehicles must be driven by their owners or by a member of the club. Several classes will be provided for.

THE New Zealand Farmers' Motor Company, Ltd., which was recently formed in Feilding, North Island, New Zealand, has opened a large motor-car depot in that town. The main showroom is 60 ft. square, and is equipped with every convenience for motorists, club rooms, ladies' retiring rooms, lavatories, and manager's and secretary's offices being provided, while at the rear is the garage and workshop. Among the agencies for cars held by the company are the Weigel, Decauville, Arrol-Johnston, Singer, and Alldays. The company is making a feature of the New Arrol-Johnston motor lorries and delivery vans and the Savage steam wagons.

SIR PATRICK MANSON, K.C.M.G., has placed an order with the Daimler Company for a 30-h.p. chassis.

A NEW motor depot has been opened at 140, Northumberland Street, Newcastle-on-Tyne, by the Rover Company, Ltd.

MESSRS. W. ELDER AND SONS, LTD., have a garage and repair shop at Castlegate, Berwick-on-Tweed, which will be of service to motorists crossing the border.

IN a new car, known as the Payne-Modern, lately put on the market by the Modern Tool Company, of Erie, Pa., U.S.A.,

the somewhat novel arrangement of springs shown in the accompanying illustration has been adopted. As will be seen, they are of the usual semi-elliptic type, but are set at an angle to the horizontal plane, so as to receive road shocks squarely. It is claimed that the arrangement renders the use of shock-absorbers superfluous.

STRANG, who won the recent Briarcliff Trophy race in America on an Isotta-Fraschini, and who is to drive a Thomas car in the A.C.F. Grand Prix, is twenty-three years old, and was born in Amsterdam, New York, U.S.A. Last year he went to France with Walter Christie as the latter's mechanic in the Grand Prix, and therefore is well acquainted with French racing methods.

FOLLOWING the practice which is fortunately becoming very general with motor manufacturers, the Star Engineering Company of Wolverhampton have just issued a book of instructions regarding the up-keep of Star cars, which should be of the greatest value to users of these increasingly popular vehicles. The book extends to over sixty pages and deals with practically every point on which the motorist frequently requires information. The question of lubrication of the engine and other parts of the transmission is very thoroughly dealt with, as is also the subject of ignition troubles, to mention only one or two of the matters touched upon in the booklet. One prominent feature of the work is the free use that has been made of clearly-drawn line illustrations showing the internal arrangement of the engine, clutch, gear-box, live axle, &c. Altogether, Star car users will find the new instruction book an indispensable companion.

UNDER the title "Concerning Repairs" comes an interesting pamphlet from Messrs. Jarrott and Letts, Ltd., descriptive of their repair works at Hythe Road, Willesden Junction. The reputation the firm have gained in connection with repair work has extended beyond the confines of their own business, and in order to meet the demand they have decided to open the works to all motor-cars, irrespective of make. The premises are complete in every essential detail, and comprise, in addition to the actual garage where the cars are overhauled, a foundry, smithy and four well-appointed machine shops. The obtaining of spare parts presents no difficulty, for what cannot be quickly purchased outside can be made within the works without delay, enabling orders, either for repairs or accessories, to be carried out both quickly and at the lowest rates consistent with good work and material. A speciality is made of insurance repairs, and in the case of a badly damaged car the facilities available are such that the vehicle can be entirely rebuilt should occasion arise.

THE "Buggyaut" is the name that has been given to a new car lately brought out in the United States.

WHILE ascending The Slope, a steep incline at Folkestone, a motor-car the other day commenced to run rapidly backwards. It broke down some railings, and was only saved from going over the cliff by a stone coping.

ON Friday, the 8th inst., a meeting of fly proprietors and drivers was held at Hove, at which a resolution was passed urging the authorities not to licence any taximeter cabs for service in the district.

AS announced in the last issue of the *M.C.J.*, Mr. C. Jarrott is taking part in the St. Petersburg Moscow race, which is to be held on the 31st inst. He will, we understand, drive the 80-h.p. four-cylinder De Dietrich on which he recently broke the fifty miles world's record at Brooklands.

EXTENSIVE alterations have been made at the motor garage of Mr. A. L. Gould, at 74, Market Place, Newcastle, Staffordshire. This is well arranged for the storage, and excellently equipped for the repair, of cars. The season has opened well, and many motorists passing through the town will find Mr. Gould's garage well able to serve their needs.

NOW that motor services are being revived at many of the principal holiday resorts we shall be pleased to hear of interesting innovations made for the pleasure of visitors. So far, one of the most enjoyable trips of which we have information is a combined motor-car and motor-boat excursion from Bournemouth, Christchurch, and Mudeford, organised by Messrs. Edmunds Bros., of Boscombe. They arrange to take visitors from their private or hotel residence by motor-car to Christchurch, and after visiting the Priory Church convey them to the Town quay, where a motor-launch awaits their arrival. After a cruise in the harbour a visit is made to Mudeford, the return to Christchurch being by motor-boat, and the trip concluding by the motor-car returning the visitors to any point in the borough of Bournemouth. Messrs. Edmunds Bros. have a large garage at 260A, Christchurch Road, Boscombe, where several hiring cars are at the disposal of visitors.

THE "sector" or quadrant lever is a form of hand lever which is found specially suited to many systems of motor

driving, many motorists having a special predilection for this type in preference to any other where it can conveniently be used. Hitherto there has been nothing on the market specially adapted for use in connection with the Bowden wire mechanism, and to remedy this the E. M. Bowden's Patent Syndicate, Ltd., have just introduced the pattern illustrated herewith. It is supplied for either right or left side, and, like all levers operating the Bowden wire, can practically be placed anywhere on the car that may be desired. The illustration requires little explanation, and will, no doubt, convey a clear

idea of the lever. A is a milled knob operating a pawl, which, with its return spring, are concealed in the stem B. The pawl engages with the rack C, and is released by pulling the milled knob A. E and D represent respectively the Bowden wire and its "stop."

A NOVEL type of vehicle has recently been supplied by the Rover Company through a Liverpool firm for use on the West Coast of Africa. It consists of a standard 6-h.p. Rover chassis, provided with dual ignition by means of dry batteries and magneto; a special body is fitted, the rear portion forming a large box, heavily bound with brass and secured by a pair of special locks. The car is to be employed in conveying specie between various stations on the West African coast.

CONTINENTAL NOTES.

The A.C.F. Grand Prix Race.

The first of the trio of cars which the Panhard Company are building for the A.C.F. Grand Prix Race is now on the road. As will be seen from the illustration we give on another page, the vehicle is an entirely different model to that which represented the firm in last year's contest. The four-cylinder engine has a bore of 155 mm. and a stroke of 170 mm. The gear is adapted to give four speeds forward and a reverse, the lever being inside the body on the driver's right hand. The final transmission is by side chains instead of the live axle which has been employed by the Panhard Company for the last year or so.

The Tour of France.

The annual Tour of France reliability trial for motor-bicycles, tri-cars, and light cars organised by the Auto-cycle Club de France commenced on Monday last, and will terminate on Sunday the 17th inst. Thirty-six entries were received, and all but two of these were duly weighed in at the Clement-Bayard Works at Levallois, near Paris, on Sunday. The competitors include nine motor-bicycles, six tri-cars, six light cars with single

Lion-Peugeot, his time, 6 h. 31 min., being equal to nearly twenty-nine miles per hour. The second, third, fourth, and fifth places were taken by De Dions, a second Lion-Peugeot being sixth.

English Motorists in France.

Among the British motorists who have lately visited France with their cars are. Mr. and Mrs. Alfred Stephens (30-h.p. Renault), Lord and Lady Ingestre (35-h.p. Talbot), Lord and Lady Saville (50-h.p. Léon Bollée), Mr. C. B. Balfour (32-h.p. Daimler), Mr. E. A. Hambro (28-32-h.p. Mercedes), Captain and Mrs. Hamilton (80-h.p. Napier), Mr. and Mrs. Harrison (40-h.p. Isotta-Fraschini), Mr. and Mrs. James Fleming (60-h.p. Fiat), and Mr. E. A. Saunders (35 h.p. Fiat).

Motor Racing in Roumania.

The Roumanian Automobile Club lately held a motor race on a 6½ kilometre circuit near Bucharest, which had to be covered six times. The winner in the over 50-h.p. class proved to be Camarasesco on the 60-h.p. Dietrich (32 min. 34 sec.); Prince G. Bibesco, on a 75-h.p. Mercedes, being second in 33 min. 21 sec. In the under 50-h.p. category, the best time was made by Gaillac on a 40-h.p. Berliet (36 min. 16 sec.).

One of the new Motor Mail Vans now being used in Paris by the French Postal Authorities. The vehicles are of the De La Buitre type.

[L'Automobile.

cylinder engines of not more than 84 mm. bore, viz., three Sinpair, and one each Rontoux, Renard, and La Metais, and thirteen cars with single-cylinder engines of a bore up to 100 mm. —three Ivrys, a Delage, a Le Gui, a Fouillaron, two Demeesters, a Bozier, an Economique, a Clement-Bayard, a Stimula, and a Prima. The programme of the daily runs is as follows:—May 11th, Paris-Dijon, 310 kil.; May 12th, Dijon-Clermont-Ferrand, 280 kil.; May 13th, speed trial and hill-climbing contest; May 14th, Clermont-Limoges, 194 kil.; May 15th, Limoges-Bordeaux, 217 kil.; May 16th, Bordeaux-Tours, 325 kil.; May 17th, Tours-Paris, 225 kil.

Racing in Sicily.

The annual race for light cars in Sicily was held on Sunday last. The event, which was confined to single-cylinder cars up to 100 mm. bore, and up to 80 mm. for two-cylinder vehicles, was over a 150-kilometre course, which had to be covered twice, equal to 187½ miles. Fourteen entries had been received, and of these eleven started, viz., two Sizaire-Naudins, six De Dions, and three Lion-Peugeots. Sizaire led at the end of the first round, but was put out of the race in the second lap by running into a bank. The race proved a victory for Giuppone on a

Public Services in Spain.

Public services of motor vehicles for the transport of passengers and goods are shortly to be established between Coruna and Corubion, between Coruna and Sada, and between Santiago and Coruna.

Miscellaneous Items.

Fifteen members of the Austrian Automobile Club left Vienna on the 3rd inst. for a motor tour in Bosnia.—Tenders are being invited by the French post and telegraph authorities for the carriage of the mails between Epernay and Sezanne (Marne) by motor vehicles.—Arrangements are in hand for inaugurating a summer motor-car service between Lourdes and Bagnères-des-Bigorre, in the Upper Pyrennes, France.—The latest novelty in Paris is a bicycle intended to be carried on a motor-car for use in emergencies. So that it can be carried in a small space, the machine is made so that it can be quickly separated into two parts.—An automobile club has just been formed in Dresden.—Two women motor taxicab drivers have lately taken their place on the ranks in Paris. One drives a Delahaye cab and the other a Corre vehicle.—Two motor-cabs have made their appearance on the streets of Berne, Switzerland

MOTERING ACCESSORIES.

Accumulator Charging Devices.

Reference has already been made in the *M.C.J.* to the fact that Messrs. Ward and Goldstone, of Springfield Lane, Salford, Manchester, are devoting special attention to requirements in connection with the electrical ignition portion of petrol cars. We illustrate in Fig. 1 a little plant known as the "Hydranamo," by means of which accumulator cars can be charged from the cellar tap. As will be seen, it consists of a

Fig. 1.

combined water motor and dynamo, of which we understand many hundreds are in use, giving every satisfaction. The machine is required to be connected to the water tap in the cellar, and on a water pressure of 45 lbs. or over, excellent results are obtainable. The normal output is 2 amps. at 8 to 10 volts at 45 lbs. pressure, which will readily charge an accumulator up to 60 amp. hours' capacity, and where the water pressure is higher it will charge two or three at a time.

In connection with this little plant a small regulating switchboard is supplied consisting of an ammeter and regulating switch. This enables the user to regulate the current according to the size of the accumulator.

The price of this set is very low and the workmanship is of the highest class, a feature being ring oiler bearings and massive commutator, enabling the machine to run day in and day out without attention.

Fig. 2.

We also illustrate a combined charging plant (Fig. 2), consisting of a petrol engine and dynamo for garages, which will be found most useful where there is no electrical supply available. The plant, which takes up very little space, consists of a two-cycle engine mounted on iron bed plate with ring oiling dynamo which will easily give 30 volts at 5 amps. with the minimum of attention. In addition to accumulator charging methods Messrs. Ward and Goldstone have some special lines in voltmeters, ignition accumulators, coils, sparking plugs, electric head and tail lamps, &c.

The "Simplex" Speedometer.

Just as of the "making of books there is no end," so there would appear to be no limit to the types of speed indicators introduced for

the purpose of enabling motorists to check official exaggerations of speed. One of the most modern devices of this kind brought to our notice is the patent "Simplex," for which the United Motor Industries, Ltd., of 45 and 46, Poland Street, London, W., are the British agents. This is apparently well in keeping with its name. The principle is based on the transmission of centrifugal force developed by the axis of rotation. By means of rotating discs with balls running freely in compartments the action of centrifugal force tends to press them to an extremity which is held in check by levers acting upon an outer ring forming the axis or indicating hand. The correct rate of speed is recorded on the dial immediately and at the actual moment of the speed. The "Simplex" speedometer is fixed on the dashboard and can be easily read from the seat. It is connected with the drive attached to the front right hand wheel of the car. The operation is by means of a cable covered in a brass flexible casing running vertically down the dashboard to the ball bearing aluminium wheel of the drive. The latter is positive, a spring belt connecting two grooved wheels. One of these is fixed centrally round the inside of the hub of the car wheel, the other is supported by a clamped and bolted bracket fixed on the steering arm in a direct line with the wheel fixed on the hub. Altogether simplicity and durability combine with accuracy in operation and reasonable cost, to make this speedometer a noteworthy feature among the specialities of the United Motor Industries, Ltd.

The "Scout" Horn.

Messrs. Bleriot, Ltd., of 23 and 54, Long Acre, whose name is universally known in connection with the lighting of cars, have rendered further

Fig. 3.

service to the motoring community by the introduction of the "Scout" horn, illustrated in Fig. 3. In this the ordinary reed is supplanted by a more effective device not so likely to get out of order. In fact, its durability is a great recommendation, while the powerful, long and harmonious sound emitted constitutes an effective herald of the approach of the car and should quickly clear the road.

INTERNATIONAL TOURING CAR TRIAL.

INSTEAD of the numerical order hitherto adopted, the classification in the International Touring Car Trial is to be alphabetical. Class 2 (a) now becomes Class B; Class 2 (b) becomes Class C; the Classes 3 to 7 are lettered D to H, and, omitting the letter I, Classes 8, 9, and 10 are altered to J, K, L. Horse-power by R.A.C. rating has been worked out for all the cars except the two White steam cars. The bore of the Nagant-Hobson is recorded as 105 mm. and not 100 mm., with the result that that car is transferred from the 20.8 to 25.6 Class to the 25.6 to 32.4 Class. The competing cars are to assemble on Whit-Monday at the "White" Company's new buildings in Camden Town, which have been offered by Mr. Frederic Coleman to the club as a starting place for the trial.

The car entered by Messrs. Benz and Cie. has now been placed in Class No. 7.

Observers were to be nominated by May 7th, and any alterations in the specifications have to be received by the 15th inst.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-28, Charing Cross Road, London, W.C.]

HANDICAPPING OF MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think we have had sufficient experience now of the R.A.C. system of handicapping to realise that from a practical point of view it does not fulfil the purpose for which it was intended. In connection with club handicaps and open handicaps where the R.A.C. formula is adopted, the whole of the interest is spoilt by reason of the fact that the results cannot be worked out quickly, and announced to the interested public and the Press immediately at the conclusion of the meeting, for at the present time the various details affecting the handicap, namely the bore of engine, weight of car, and windage area, have to be forwarded to the R.A.C. officials, and days elapse before any definite announcement is made as to the result of any event, consequently by the time the actual results are received public interest has disappeared entirely.

What is wanted is a practical handicap which can be worked out by club officials on the ground, and the result of every handicap announced at the immediate conclusion of the meeting, and I think it would be wise for club secretaries and committees—who are endeavouring to uphold the sport and pastime of automobilism, and to sustain the interest of their members in the various hill-climbing and speed events organised by them—to see whether some other formula cannot be adopted whereby this can be done. In addition to this, I think it has now been unques-

greater mileage from the covers, and therefore no necessity for the continual removal from the rims; and detachable rims, wheels or spare covers are unnecessary, the carrying of a gaiter only being necessary.—Yours truly,

INTERESTED.

A WARNING RE BACK AXLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Although throughout the whole of last season the sole trouble that we had with back axles was the shearing of two pins on the torque rods—it will be freely admitted that such a record is probably unprecedented—yet knowing the cause of the breakage of the two torque rod pins, we should like to advise your readers of the reason of many back-axle troubles from which we, however, have been free.

In both the cases to which we refer the spring seating sleeve had rusted on to the back axle tubing. We have found in our experience that few chauffeurs or owners take the trouble to keep the spring seating bearings clean and in working order. When a car is used in wet weather this particular bearing gets covered in water and eventually rusts, the result naturally being a breakage.

We have found that owners and chauffeurs think it sufficient, where they find a grease cup, to fill it up and press it home, but this is not so,

Rests at the Wheel of the Austin Racer he will drive in the A.C.F. Grand Prix event. The road wheels, it will be noted, are fitted with Dunlop detachable rims.

tionably proved that the effect of the stroke on the horse-power of an engine is a point to be considered, and should be taken into consideration in connection with any handicap, but the R.A.C. formula ignores this important matter of stroke.

Surely after a year's experience everybody realises that the R.A.C. formula does not meet the requirements of automobile sport, and that some fair and practical handicapping system must be substituted in place of it.—Yours truly,

CHAS. JARROTT.

A NEW INNER TUBE FOR MOTOR TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The correspondence on detachable rims and wheels in your recent issues inferred that these were indispensable to motorists, but I venture to suggest that they are palliatives only. The true cause of the troubles is the frailty of the air tubes of pneumatic tyres, therefore to prevent them from damage is the primary necessity, and having done this, tyre troubles will practically cease. As the outcome of a series of experiments in this direction may I be allowed to bring before your notice a new resilient detachable tube shield or protector which has proved itself to be perfectly successful and may be used with any existing cover and rims. An air tube of smaller diameter than ordinarily used is employed; for instance, a 120 mm. cover requires a 90 mm. air tube, and the space thus left between them is filled with a resilient rubber lining or band, so that on this lining and ordinary cover being inflated the tyre as a whole becomes of the same resiliency as compressed air at ordinary pressures, the air tube always resuscitating the tyre in the ordinary manner; at the same time some 1½ in. of space must be punctured before the air tube can be reached. The results are: Absolute resiliency; immunity from punctures or bursts; continual inflation;

and we would strongly recommend owners to see that every two or three days the grease cup is entirely taken out, that paraffin is forced upon the bearing parts through a syringe, and thereby ensure every part being cleansed; that the greaser is then filled up and three or four grease cupfuls forced home.

We think other manufacturers will agree with us that sufficient attention is not given to parts greased by Stauffer boxes, and that the advice we give is wholesome. We trust, sir, that you will give prominence to our letter, not only for our own sake, but for the benefit of every other manufacturer and for the sake of owners. The point we are raising, viz., carefulness, not only in lubricating but in cleansing—is of the utmost importance to prevent breakages.—Yours truly,

WEIGEL MOTORS (1907), LTD.

COURTESY ON THE ROAD.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just returned home after a tour of 1,500 miles round England, and feel it my duty, in the interests of other motorists, to give you my impressions.

(1) I have found that in the great majority of cases passing motorists have shown little or no consideration, either to the general public or to other motorists, the result being that they have left clouds of dust, to the discomfort of those who have as much right to the road as themselves.

(2) In nearly all cases I have observed that the motorist has occupied the centre of the road, and has shown, in many cases, little inclination to take his own side in passing my car.

I have had motor-cars for seven years, and my instructions to my chauffeur have always been to show consideration to every foot

passenger or vehicle passed on the road, and always to drive on his own side of the road. I have maintained in public and private that this was the general custom by those in charge of motors, but I deeply regret that my experience during the fourteen days' tour has been an emphatic "eye-opener," and so long as the present lack of consideration is shown, the motorist must continue to be the "most hated" individual on the road, and need not be surprised if local authorities and Parliament enact stringent regulations to protect the general public.

If the golden rule of "doing unto others, &c.," were more generally acted upon, it would add greatly to the happiness and comfort of all concerned.—Yours truly,

G. B. B.

WET DRIVING SEATS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your contributor "Arcanum" has undoubtedly hit on one of the most difficult problems in connection with motoring. There is nothing more dangerous than sitting in a pool of water, especially on a cold day. Only recently a friend of mine was seriously ill for months as the result of sitting on a damp seat whilst driving his car over a long stretch. An effective method of avoiding the water which collects in wet weather on the seat is to have a small extra seat on top of the ordinary cushion. The rain finds no place to lodge in this, but falls into the space around it. Another good idea is to use a perforated rubber mat, which in dry weather can be kept under the cushion, the water, of course, sinking between the perforations into the rubber spacing.—Yours truly,

OLD HAND.

Messrs. Walter and T. M. Davis, the Inventors of the Stearns Spare Wheel.

The Stearns Spare Wheel has now a world-wide reputation and is in use in every civilized country.

ROUTE FOR MOTOR TRIP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to your correspondent who asks for a good route from Sudbury to Ramsgate, the following will be found a very pleasant and easy journey.

Newmarket via Audley End to Bishop's Stortford; then on through Harlow; three miles on the road towards Epping turn off to Ongar, thence to Brentwood through Norley and Grays to Tilbury, cross at Tilbury Ferry, very easy, and men remarkably civil and obliging, cost 1s. per wheel, and 2d. or 3d. each passenger), to Gravesend, thence to Chatham; here go by New Road shortly after crossing the Rochester Bridge, and then, amid traffic, up Chatham Hill, through Sittingbourne to Canterbury, through Canterbury to Ramsgate. There are nice roads all the way, the nasty hills, Chatham, very greasy if wet, Boughton Hill shortly before reaching Canterbury. By this route Ramsgate is about 90 miles from Bishop's Stortford.—Your truly,

J. B. P.

THE DANGERS OF LONDON TRAFFIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At the Clerkenwell Police Court a few mornings ago a motorist was summoned for driving a motor-car in a manner dangerous to the public at the junction of Gray's Inn Road and Theobalds Road, London. In giving his decision Mr. Bros, the magistrate, said the crossing in question was, in his opinion, the most dangerous in London. In addition to motor vehicles and the ordinary traffic, there are now added electric trams, and drivers would have to be on the

look-out all the time and not depend even upon the constables placed on special duty.

It would be interesting to have the opinion of those well acquainted with London traffic as to whether the magistrate was really correct in his view as to the most dangerous crossing in London. Piccadilly, Wellington Street and the Strand, Ludgate Circus and the Bank are all points of danger which in many respects offer as much opportunity for accidents as the point Mr. Bros mentioned.

In this connection it does seem strange that the public do not make a use of such subways as those provided at the Mansion House; although apparently the City Corporation have an idea that an educational process is going on, for they have decided to construct subways underneath the City approaches to Blackfriars Bridge as showing they are fully alive to the risks one has to run in the streets of London today. That these are growing in number in London as well as in the City area is apparent from the reports of the Metropolitan Commissioner of Police, who records the accidents in the area for which he is responsible as follows:—

| | | Killed. | | Injured. |
|------|-----|---------|-----|----------|
| 1904 | ... | 134 | ... | 9,121. |
| 1905 | ... | 157 | ... | 10,280. |
| 1906 | ... | 185 | ... | 12,237. |

This increase is, of course, not wholly due to the progress of the motor vehicle, but, as we might have expected, from the growth of traffic generally. At the same time I do feel it would be useful if the authorities could take special care to regulate the traffic more thoroughly at the points I have mentioned, and that motorists should continue to give their assistance in securing discipline at these dangerous places.—Yours truly,

T. JACKSON.

A WONDERFUL TALE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is wonderful what funny stories about motor-cars get into some of the papers published for the benefit of the multitude. I was reading one the other day under the heading "King Leopold's Pluck." It describes how the King of the Belgians was out in his motor-car one day, going at a rate of some forty miles an hour, when suddenly, on rounding a corner, the Royal motorist perceived a woman, wheeling a perambulator, and leading a child by the hand, standing in the middle of the road, dazed and unable to move from fright. The car could neither be stopped in time nor turned aside, owing to the high banks on both sides of the narrow road. "Reverse, and run into the ditch!" came the Royal command; and the chauffeur did so. The result was that the car turned a complete somersault and landed in the ditch.

No wonder the car went into the ditch! Moreover, I do not think the gear-box would be worth much after the chauffeur's attempt to get in the reverse while travelling forward at a fast speed. But there! I do not think the King's chauffeur would try such a foolish thing.—Yours truly,

T. R. Fox.

CONNECTING UP ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The manufacturers of a certain car place emphasis on their instructions to always connect up the accumulator in the same way, the positive pole to the coil and the negative to earth. Another authority claims that in passing from one point to another the electric current carries particles of metal with it—e.g., in the case of the contacts on the tremblers of the coil, one point would be eaten away and the other built up. Hence, he advises reversing the poles of the battery each time it is replaced. Is there any merit in this, or is there any reason for connecting up the wires always the same way? Perhaps some readers of the *M.C.J.* will assist me.—Yours truly,

NOVICE.

THE ROVER CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As to the query about the 8-h.p. Rover car in your issue of the 9th inst., I have had one in almost daily use since November, 1906. Mileage run about 6,700 miles. Petrol consumption averages over thirty miles per gallon. Two new tyres (Dunlop grooved) to driving wheels after about 5,000 miles; former tyres are still serviceable, but grooves worn smooth. Repairs bill: two new brake bands, brake wire twice renewed, Bowden wire for spark control renewed, front spring set up, and two new bolts for this. Back axle was dis-assembled last month for inspection, and the only visible sign of wear was jaws of front dog-clutch of propeller shaft showed very slight wear, but not sufficient for renewal. Gear wheels show no sign of wear.

I have never yet been delayed upon the road except for punctures. Car is two-seated with hood and screen and detachable tonneau, and upon ordinary roads and weather conditions will average twenty miles an hour.—Yours truly,

FRANK HEMMING.

A MOTOR tube and other accessories were found near Kirkwhelpington, on the Newcastle to Jedburgh road, on Saturday, by Mr. G. R. Flowers, of 45, Buxton Terrace, Jesmond, Newcastle-on-Tyne, who will be pleased to return the same to the owner on hearing from him.

RACING AT BROOKLANDS.

PLEASANT weather favoured the motor race meeting on the Brooklands track on Saturday last, when a series of interesting races was carried through. Punctually to time the first event was started at 3 p.m. This was the All-comers' Handicap Sweepstakes, confined to cars which competed at the Easter meeting. The distance was about 7½ miles. No less than nineteen vehicles competed. The limit cars proved too much for the back-markers, and the two 22.5-h.p. Ford cars, with 7,116 yards start, and a 8.9-h.p. Sizaire, 7,472 yards, finished in the first three, Mr. E. A. Anthony managing to beat Mr. H. A. Bate on the post by a yard, with Mr. B. S. Millard on the Sizaire close up. The average speed was about forty-five miles per hour, but the scratch car would have had to be driven ninety-five miles an hour to make a dead-heat. There was an exciting moment at the finish of the race when Cundy, on the Napier, finding himself shut in by several smaller cars, applied his brakes, with the result that the car waltzed round, fortunately without any damage resulting.

Mr. J. W. Stocks (25.6-h.p. De Dion) had practically a walk-over for the Fourth 26-h.p. Race, as the only other competitor, Mr. J. F. Browning on a 25.6-h.p. Napier, started with a punctured tyre and went round quietly, carrying off the second prize.

The third event was a Handicap for Private Competitors, for motor-cars entered and driven by private competitors of the Brooklands Club. Distance about eight and a half miles. There were five competitors, two being on scratch, a Delaunay-Belleville and a Weigel, a Nagant-Hobson, 2,335 yards, a Sizaire, 5,363 yards, and a 6-h.p. Wolseley, 8,404 yards (nearly five miles). The handicappers under-estimated the latter, which

Mercedes, third. An objection was, however, lodged in connection with the event, so that the above result can be taken as being definite.

The most exciting event of the day was the Fourth 90-h.p. Race for cars of a cylinder dimension of 225.1 or under. Distance about 5½ miles. There were only three competitors—Resta on Mr. F. R. Fry's 76-h.p. Mercedes, C. Lane on Mr. Warwick J. Wright's 89.5-h.p. Darracq, and F. Newton on Mr. S. F. Edge's 90-h.p. Napier. Although Newton made a fine effort to get by round the back banking, Resta led all through, and, amid much cheering, won by fifty yards, at a speed of ninety-three miles an hour.

The private match over a distance of five miles between Mr. O. S. Thompson on his 36.1-h.p. Austin and Mr. H. G. Nalder on a 35.7-h.p. Berliet was a very close race, the two cars being almost bonnet to bonnet the whole time. At the finishing point, however, Mr. Nalder's car was about a length in front.

The last event of the day was the Fourth 40-h.p. Race for cars of a cylinder dimension of 100 or under. Distance, about 18½ miles. Result: 1, Mr. S. F. Edge's 39.6-h.p. Napier (F. Draper); 2, Mr. S. F. Edge's 38.4-h.p. Napier (F. G. Cundy); 3, Mr. Walter Phillips' 38.4-h.p. Humber (W. G. Tuck). These were the only three competitors, two Napiers and a Humber. Cundy (Napier) made the running, with Tuck (Humber) a few yards behind. These two quickly made a gap of half a mile from Draper (Napier), and so they ran for four laps. On the fifth circuit the Humber began to slow up, one of the inlet valve springs having broken. Cundy was then left with a lead of nearly a mile, but Draper began to quicken up and overhauled him rapidly, and though Cundy managed to accelerate in the last few yards, Draper won a magnificent race by a yard.

Racing at Brooklands.—The Finish of the Fourth 90-h.p. Race, which was won by Resta on Mr. F. R. Fry's 76-h.p. Mercedes.

was driven by Mr. O. S. Thompson, as it won by over a mile, 300 yards separating second and third. Mr. C. Hobson's 27.9-h.p. Nagant-Hobson was second, and Mr. T. Faulkner's 41.9-h.p. Weigel third.

No less than thirty competitors turned out for the Motor Cycle Handicap Plate for motor-bicycles of which the engines, if twin-cylinder, do not exceed 85 mm. by 95 mm. for each cylinder. Distance about five and a half miles. Interest in the race was increased by the fact that the start took place near the judge's box in full view of the spectators. The result was: (1) H. Shanks, jun., 2½-h.p. Chater Lea (2 min. 45 sec. start); (2) H. G. Partridge, 6 h.p. N.S.U. (1 min. 45 sec.); (3) W. H. Bashall, 3½-h.p. Triumph (1 min. 40 sec.). A speed of fifty-eight miles per hour was attained during the race.

The May Cup, a handicap for private competitors, followed. This was for motor-cars driven by private competitors of the Brooklands A.C. Distance about five miles. Fourteen cars turned out, Mr. A. Van Hoboken, 71.7-h.p. Mercedes, being on the scratch mark, and Lieut. H. C. Halahan, 17.5-h.p. Dennis, having maximum start, 3,586 yards. The event proved a victory for Mr. P. D. Stirling on a 35.7 Berliet, 2,214 yards start; Mr. C. Hobson, 27.9-h.p. Nagant-Hobson, 2,870 yards, being second, and Mr. G. C. Moss, 27.2-h.p. Arrol-Johnston, 3,126 yards, third.

The sixth race was the Limit Sweepstakes, for cars which did not exceed a speed of sixty miles per hour during the race. Distance between six and eight miles. Mr. J. W. Stocks, driving his 25.6-h.p. De Dion, made the running from the start, hotly followed by Mr. van Hoboken on his 71.7-h.p. Mercedes. The leading cars turned into the straight a lap too soon, followed by all the others except Mr. Nalder on his 35.7-h.p. Berliet. Eventually the three cars to pass the post the second time were Mr. D. Pigot, 35.7-h.p. Berliet, first; Mr. P. D. Stirling, 35.7-h.p. Berliet, second; and Mr. A. van Hoboken, 71.7-h.p.

It was announced at the meeting that a match will be run on the track in August between Mr. S. F. Edge, driving a Grand Prix Napier car, and Mr. Charles Jarrott, driving a Grand Prix De Dietrich or a Mors car. This should prove an exciting and interesting event.

MOTOR VEHICLES AND ROAD REPAIR.

AN important point in motor-bus law has been raised at the Wandsworth County Court in the case of Barnes Urban Council v. the London General Omnibus Company. The district council claimed £116 under Section 23 of the Highways Locomotive Amendment Act of 1878. According to the plaintiffs the amount claimed had been expended in repairing Avondale Road, Mortlake, which was said to have been used by defendants for their motor-buses. The traffic was extraordinary, and it was contended for the council that the defendants were liable for it.

Mr. Ernest Charles (for the defendants) submitted that the local authority were bound to deal not only with the traffic that was usual, but with all manner of traffic. Counsel urged that what was called extraordinary traffic at one time became ordinary traffic as a sort of custom, and furthermore that the damage to the road was not caused within the period for which the council could recover.

Judge Bray reserved his decision.

M. ABRAN, of "L'Auto," has just returned from a trip round France on an 18-28-h.p. Germain car, fitted with Danlop detachable rims and tyres. On the whole journey of 5,500 kilometres the tyres were never once touched, and on their return to Paris looked almost new.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE Club is endeavouring to secure a date in September for the International "Four-Inch" Race for the tourist trophy, as it is felt that this would be a better month than October for the competition. The decision rests with the Isle of Man authorities.

The Technical Committee of the Club has had before it a letter from the Commercial Motor Users' Association suggesting that the R.A.C. should undertake a series of acceleration tests, extending over one or two days, such tests to be held in respect of public service vehicles which are constructed to comply with the Metropolitan police regulations, limited to a maximum of 35-h.p. R.A.C. rating, and to carry a standard double-decked omnibus body.

The Competition Committee have considered the question of holding the fourth race for the Graphic trophy. It was agreed that the competition should be held during the Tourist Trophy week in the Isle of Man in the autumn, and that the formula employed last year should stand. The competition is therefore restricted to vehicles fitted with internal combustion engines of single piston four-cycle type which comply with the following formula:—Cylinder diameter in inches squared multiplied by the number of cylinders must not exceed 125. Double-piston or other engines will be rated on their merits, but no engine whose combined effective piston-area exceeds 98.17 square inches can be allowed to enter. Particulars as to the bodies of competing cars will be inserted in the regulations, the committee having not yet decided as to the form of body or the wind area which will be necessary for this competition.

A meeting of the General Committee was held in the Council Chamber at the Nottingham Exchange on Saturday. Captain H. H. P.

April brought a continuance of the progress which has marked the career of the Motor Union this year. Individual members enrolled during the month numbered 380. Including the affiliated members, the Union now has a membership of about 15,000.

The following have been elected vice-chairmen of the Motor Union for the year 1908-9:—Mr. C. H. Dodd, Capt. D. Hughes Morgan, J.P., Mr. R. A. McCall, K.C., Mr. W. Ballin Hinde, and Earl Russell; Col. R. E. Crompton, C.B., has been elected a vice-president.

AUTOMOBILE ASSOCIATION.

THE utility of the Automobile Association system of agents has again been exemplified by the recovery of two motor trunks which were lost from a member's car on the road between Banustaple and Gloucester. Immediately on receipt of a telegram advising the loss, the A.A. Road Dept. circulated notices offering a reward, and these were exhibited prominently by the A.A. agent in every town and village on that road, with the result that the finder of the trunks called at the Bridgwater Motor Company within twenty-four hours of the notice being exhibited, and the lost property has been restored intact to the member's keen satisfaction.

CYCLE AND MOTOR TRADES BENEVOLENT FUND.

THE monthly meeting of the executive was held on Wednesday of last week, Mr. E. A. Lamb in the chair. The treasurer reported a balance of £479 1s. 6d. to the credit of the current account at the bank. Twenty-nine subscribers and four members were elected.

Motoring Under Difficulties during the Recent Floods in Detroit, U.S.A.

Deasy presided. In addition to the subjects that are referred to elsewhere the committee decided to give medals for the best performances in events organised by local clubs.

THE MOTOR UNION.

THE Union has confirmed the action of the Touring Committee in appointing hotels and repairers in Scotland. Messrs. Clark, Brodie, and Co., Thistle Street, Edinburgh, were appointed solicitors to the Motor Union in Scotland.

One hundred and twenty-two special danger signs and sixty-eight concealed turning signs have been erected to date, and other local authorities are being approached to use the signs issued by the Motor Union.

The Motor Union will issue an almanack at the end of May. It will cover the twelve months ending May 31st, 1909.

The M. Union have just issued in a small pamphlet, pocket size, their "Rules and Courtesies of the Road," which are now to be seen hung in many of the leading motor garages throughout the country.

The Earl of Dartmouth, P.C., the Earl of Donoughmore, and Lord Leigh, P.C., have been added to the list of vice-presidents of the Motor Union.

The tenth provincial meeting of the Motor Union of Great Britain and Ireland will be held at Bournemouth on Saturday, May 23rd. The General Committee will meet in the morning under the chairmanship of Mr. W. Joynson-Hicks, M.P., at the Municipal Offices, at the invitation of the Mayor and Corporation. Dinner will be held in the evening at the Hotel Mont Doré.

Seven applications for relief were dealt with, and cheques were drawn in five of the cases. One member wrote to say that he had secured a new engagement, so that his name could be removed from the employment register. In three other cases members of the council were in communication with the unemployed subscribers with a view to finding engagements for them.

It is arranged that in future the Executive Committee meetings will be held on the first Tuesday in every month. Mr. A. J. Wilson, 154, Clerkenwell Road, London, E.C., is general hon. secretary and treasurer.

ROADS IMPROVEMENT ASSOCIATION.

THE Roads Improvement Association has accepted the invitation of the French Government to take part in the International Road Congress to be held in Paris in October, 1908. The Association has appointed the following members as its delegates:—Lord Montagu of Beaulieu, Col. R. E. Crompton, C.B., M.Inst.C.E., Hon. C. S. Rolls, M.A., Dr. H. S. Hele-Shaw, F.R.S., Mr. H. Howard Humphreys, M.I.M.E., Mr. W. J. Taylor, M.Inst.C.E., and Mr. W. Rees Jeffreys (hon. secretary).

BLACKPOOL.

A SPEED-JUDGING contest was held by the members of the Blackpool and Fylde District Motor Club on Saturday afternoon. The course was five miles from the Lea Gate Hotel, over Freckleton Marsh and towards Lytham. There were ten entries, and the speeds at which the cars had to travel varied from 16 to 19 miles an hour. The winner was

Mr. F. J. Thompson, of Fleetwood, whose car was marked 16 miles an hour. He covered the distance in 18 min. 50 sec., being only 5 sec. off the time allowed for the distance. Councillor A. Parkinson, of Blackpool, was a good second for the same rate of speed, his time being 18 min. 45 sec. Dr. Buckley, of Poulton, who had to travel at the rate of 18 miles an hour, for which he was allowed 16 min. 40 sec., covered the five miles in 17 min. 15 sec.

MANCHESTER.

THE Manchester Automobile Club on Saturday held a trial of the reliability, fuel economy, and efficiency of members' touring cars. About thirty cars were entered and nearly all started. Leaving Bowdon on Saturday morning with full petrol tanks, the cars were driven under official observation via Chester, Mold, Ruthin, Denbigh, the Sportsman's Arms, and Pentre Voelas to Bettws-y-Coed, where lunch was taken; and in the afternoon the run was continued by Capel Curig, Beddgelert, Portmadoc, Tremadoc, Blaenau Festiniog, and Dolwyddelan to Bettws-y-Coed, where the cars, with their leads, were weighed and their petrol consumption was carefully measured. The total distance was about 132 miles, and included many severe gradients. During the afternoon the speed of the cars was timed from a standing start over a prearranged portion of the steep mountain road above Blaenau Festiniog.

After the completion of the trial the following particulars of the performances of the various cars were announced at the club's headquarters at Bettws, but it was explained that these figures were subject to verification, and that the actual results of the competition and the awards would not be made known until the various calculations, in which weight and cylinder dimensions are factors, had been worked out by the committee:—

CLASS I.—Section A.

| Entrant. | H.p. | Car. | Fuel consumption. | Time on hill. |
|--------------------|-------|-------------|-------------------|---------------|
| | | | gals. oz. | sec. |
| F. A. Baume ... | 24-40 | Berliet* | 7 154 | 64 3-5 |
| G. B. Heywood ... | 28 | Lanchester* | 7 0 | 56 2-5 |
| J. Higginson ... | — | La Buire* | 10 32 | 55 1-5 |
| E. W. Johnson ... | 35 | Mercedes | 11 156 | 57 1-5 |
| H. Kershaw ... | 28 | Daimler* | 14 100 | 60 |
| H. W. Lea ... | 28 | Lanchester* | 7 107 | 54 4-5 |
| J. Moon ... | 30 | Siddeley | 8 77 | 115 |
| H. H. Summers ... | 45 | Mercedes | 14 140 | 53 4-5 |
| C. H. Wallwork ... | 30-40 | Balsize | 9 107 | 64 2-5 |

CLASS I.—Section B.

| | | | | |
|----------------------|-------|----------|-------|--------|
| E. Allen ... | 18 | Siddeley | 5 91 | 55 3-5 |
| J. Duckworth ... | 10-12 | Sunbeam* | 4 92 | 92 |
| W. Jackson ... | 16-20 | S.C.A.T. | 6 33 | 93 |
| Mrs. E. A. Riley ... | 20 | Balsize* | 6 80 | 79 |
| J. L. Tattersall ... | 20 | Balsize* | 5 157 | 65 4-5 |
| A. W. White ... | 14-16 | Argyll* | 8 22½ | 97 1-5 |

CLASS II.—Section A.

| | | | | |
|---------------------|-------|-------------|-------|--------|
| M. O. Ashworth ... | 40 | Berliet* | 7 72 | 52 2-5 |
| G. J. Crawford ... | 28 | Lanchester* | 6 148 | 55 2-5 |
| H. Hollingdrake ... | 35-50 | La Buire* | 7 148 | 43 2-5 |
| A. G. Hogg ... | 45 | New Eagle* | 9 8 | 62 2-5 |

CLASS II.—Section B.

| | | | | |
|-------------------|-------|-----------|-------|--------|
| J. Arrowsmith ... | 18-24 | Horbick* | 9 135 | 78 2-5 |
| T. Hooydonk ... | 14-16 | Argyll* | 8 46 | 59 2-5 |
| V. G. New... .. | 14 | Siddeley | 4 119 | 73 3-5 |
| J. Newton ... | 22 | S.C.A.T.* | 9 28 | 51 3-5 |

*The cars marked with an asterisk all made non-stop runs.

The trial was conducted under the supervision of the following members of the committee:—Messrs. A. E. Jones, A. E. Crowdy, J. Hoyle Smith, D. A. Parkyn, S. Wallwork, and T. M. Young, with the secretary (Mr. J. B. Thistlethwaite).

CRYSTAL PALACE.

THE Crystal Palace A.C. will hold an open competition on the 30th inst. After the competing cars have been weighed and have done a half-mile speed test on the track at Brooklands they will be sent on a road test of from 80 to 100 miles to demonstrate the flexibility of their engines and the efficiency of the means of transmission of power to road wheels. The cars will be divided into five classes:—(A) for engines not over 9-4-h.p.; (B) for engines not over 16-h.p.; (C) for engines not over 25-6-h.p.; (D) for engines not over 40-h.p.; (E) for engines not over 60-h.p.

The finish will take place at the White Lion Hotel, Cobham, and it is interesting to note that the Crystal Palace A.C. is the first club to arrange for a competition on the track at Weybridge.

CAMBRIDGE AND ISLE OF ELY.

THE Cambridge and Isle of Ely A.C., of which Mr. E. F. Bindloss is the hon. secretary, has done good service in opposing the imposition of speed limits within its area and in looking after the proper maintenance of roads. During the season it will hold social meets at the invitation of its president, Col. Duncombe, Sir Chas. Hamilton, and other friends.

HULL.

THE meeting of the Hull and District A.C. was held on Monday at the headquarters, the Imperial Hotel, Hull. Dr. W. H. Coates was in the chair and the report and balance-sheet showed that the club was in a sound financial position.

Mr. A. J. Atkinson was elected president, Sir H. Seymour King, M.P., Colonel Harrison-Broadley, M.P., the Hon. Guy Wilson, M.P., and Dr. W. H. Coates, vice-presidents; Mr. Geo. H. Strong, of Prudential Buildings, Hull, was elected secretary, Mr. H. Whitely hon. treasurer, Mr. Henry Strong assistant secretary, and Mr. W. C. Dawson hon. solicitor. Dr. Coates was elected chairman of a strong committee, consisting of Messrs. A. T. Simpson, Dr. Howlett, J. Richards, A. E. Hagestadt, Geo. Wade, H. Brown, and B. Hancock; Mr. J. Richards and Mr. Hagestadt were re-elected auditors.

MOTOR CYCLING.

THE Motor Cycling Club's annual London to Edinburgh 24 hours' run, and London to Edinburgh and back competitions for the Schulte Cup and Motor Cycling Club's Challenge Cup, will take place as usual at Whitsuntide, starting from Highgate at 10 p.m. on the 5th prox. The London to Edinburgh competition is open to motor-cycles and cars. The Schulte Cup is for competition amongst motor-cycles and cars the catalogue price of which does not exceed £250 complete. The M.C.C. Challenge Cup is for motor-bicycles only in the double journey. All those who wish to take part in these events should apply to the hon. secretary of the club, Mr. A. Candler, 1, Lime Grove, Shepherd's Bush, W.

SOUTHERN.

THE first speed-judging contest of the year was held on Saturday and was voted a great success. A large entry was secured. The winner proved to be Mr. Malcolm Brook on his six-cylinder car. His prize was a silver cigarette box.

A 12-h.p. Sisaire et Naudin Car with four-seated body.

The new model has all the features of the well-known racing model, with the exception that the chassis and wheel base are longer, and three-quarter elliptical springs are fitted to the rear. The power is supplied by a 12-h.p. single-cylinder motor. The car has a very smart appearance; the height of the front and rear seats is exactly the same, and the whole vehicle is kept low to the ground.

SOUTHEAST AND DISTRICT.

THE Southend and District Motor Club has decided that country members residing outside a radius of ten miles from the club's headquarters, Southend-on-Sea, should be accepted as active members at half subscriptions. Messrs. E. H. Richards, of Wanstead, and J. W. Austin, of Chelmsford, have been elected to the committee, and Mr. E. Scratton, J.P., of Prittlewell Priory, has been elected a vice-president.

NORTH BERKSHIRE.

THE North Berkshire Automobile Club has distinction in being the only motoring organisation in the provinces with a lady as hon. secretary. Miss Constance Fletcher informs us that the club was formed with the object of bringing motorists together more from the social than any other point of view. Much, however, has been done to discountenance the speedy driving of vehicles and also to bring about a general good feeling amongst users of the road in the area of its operations. During the summer meets, hill climbs, and competitions will be held in private grounds.

AUSTRALIA.

ON the 2nd inst. Mr. Gordon Dixon won the gold medal and championship of the Automobile Club of Australia on his 25-h.p. Talbot car.

There was some excitement at the last monthly meeting of the Automobile Club of Australia at Elizabeth Street, Sydney, owing to a diversity of opinion as to the conditions that are to govern the coming sealed motor-car handicap contest. Many members were adverse to the coming competition, holding that the rules and conditions by which it is to be governed were altogether too vague and impracticable.

Many were of the opinion that something definite should be stated with regard to the conditions and regulations of the trial lest it might turn out to be more farcical than useful. Others, however, held that the test promised to be run on a fair basis, and the fact of the people not knowing anything about their handicap until the last moment would tend to make the event more exciting than otherwise.

SOUTH AUSTRALIA.

FROM the Automobile Club of South Australia comes a well edited year book giving particulars of the advantage of membership, the rules of the organisation, the annual report for the past year, a long list of hotels and storekeepers in the Colony who stock petrol, a table of distances from Adelaide to various towns in South Australia, the text of the Act relating to motor vehicles in vogue in the Colony, and a list of motor-car owners therein. The organisation is pursuing a wise and watchful course with regard to the movement for encouraging the improvement of the roads, is organising competitions, and taking care that the social side is not overlooked.

THE sum of £218 12s. has been subscribed to the Foundation Fund of the Incorporated Institution of Automobile Engineers.

ON Thursday of last week the Lancashire Motor Cycle Club held a hill climbing competition among its members. This took place at Bunker's Brow, Gib Lane, a little-used road branching off the Livesey branch road which leads to Feniscowles Station.

A NEW DESIGN OF GEAR TEETH.

BEFORE the Society of Engineers Mr. Robert H. Smith, Assoc. M.I.C.E., M.I.M.E., M.I.E.E., Em. Prof. of Engineering, read a paper on this subject. It opened with an acknowledgment of the now forgotten

A "Standard" Six-Cylinder Car fitted with a special body by Messrs. Friswell, Ltd. (the first they have built), for Miss Arnott, of "Woodlands," Cork.

It will be observed that the front is very long, Miss Arnott being a very tall lady; the whole car is exceptionally low. The body-building department is one of the latest departures of Messrs. Friswell, Ltd., who find it handier than sending chassis away to the coachbuilders.

work of Edward Sang, and enumerated ten kinds of excellence in the teeth of wheels, only two of which influenced the orthodox cycloidal and involute designs. Besides uniformity of velocity ratio and strength the other points of consequence were obliquity of action, number of contacts, smallest practicable number of teeth, undercutting, sharpness of outline at shoulders, frictional waste of power, abrasive waste of material, change from correct shape by wear. It explained the advantages of short teeth, and denied that the thrust could be effectively divided between two contacts. It was, however, essential that contact should begin before the previous contact finished. In the author's new design the contact lasts 1.12 times the pitch with two 12-teeth pinions gearing with each other, and 1.4 times the pitch when two very large wheels are in gear, the addendum of the tooth being made $\frac{1}{4}$ of the peripheral pitch. The author gave a simple formula for the frictional waste work of toothed gear, and calculated that of his new design in an average case to be in the ratio of 106 to 180 to that of ordinary involute teeth. The leading aim of the new design was to combine small obliquity of thrust with avoidance of sharp curvature in the outline. The touching face of the one tooth should have a radius of curvature only little less than that of the flank of the tooth geared into it; in other words, the "closeness of fit" between the two should be as great as possible. This prevented the squeezing of the unguent out from between the bearing parts, increased the effective width of bearing surface, and diminished the actual intensity of pressure. The sharpness of outline at the shoulder increased with decrease of obliquity of action, and the actual design was a compromise between these opposing influences such as yields maximum efficiency, such as also secures a substantial increase of strength.

WE learn that the United Motor Industries, Poland Street, London, W., have been appointed sole British agents for the Bousfield silencer, illustrated in the last issue of the *M.C.J.*

CASES UNDER THE MOTOR CAR ACT.

A DISMISSAL.

The Wimbledon magistrates were engaged for a long time on the 6th inst. hearing evidence in a summons against Lionel Savory, 174, Kensington Place, Page Street, Westminster, who was charged with driving a motor-car at an excessive speed in Morden Road. Defendant, sworn, said he was not driving at the speed alleged (twenty-eight miles), and that the signal was given much too soon, thereby exaggerating his speed. The whole object of his cross-examination was to show how carelessly the whole case was carried out. The chairman (Mr. C. Giles, K.C.) said the majority of the magistrates had come to the conclusion that the case must be dismissed on the ground that the evidence did not satisfy them on the charge brought.

UNLICENSED DRIVER.

Cecil Cambridge, of Messrs. Barclay, Perkins, and Co., was summoned, at Highgate, for driving a motor-car without having a licence, and Albert Shepherd, chauffeur, of Deverell Street, New Kent Road, was summoned for aiding and abetting Cambridge in the commission of the offence. It was alleged that on April 14th Shepherd was in charge of the car, and that he allowed Cambridge to drive in Tottenham Lane, Hornsey, where the vehicle was driven on the footway. As a result one of the wheels was smashed by the contact with the kerb. The police came upon the scene, and found that Cambridge had no licence. The car belonged to Messrs. Barclay, Perkins, and Co. Cambridge was fined 20s. and costs, and Shepherd 10s. and costs.

ALLEGED OBSTRUCTION.

An important case has been heard at the West London Police Court, before Mr. Lane, K.C., when three chauffeurs employed by Messrs. Humber, Ltd., were summoned for allowing their motor-cars to remain longer than was necessary in the public street in front of the De Vere Hotel, Kensington. The company had a contract to supply cars for the use of the guests at the hotel, and these were in the habit of waiting outside during the arrival and departure of the visitors. Mr. Englebach, for the defence, submitted that as these were ordinary private vehicles waiting for the hotel guests there were no grounds for conviction. In dismissing the summons Mr. Lane held that as these cars were not "public carriages," they did not come within the section of the Police Act.

UNLICENSED CHAR-A-BANC.

Frederick Ray, of Eastbourne, has been fined £1 and costs for permitting an unlicensed motor char-a-banc to ply for hire in the town on a recent occasion.

THE LONG DISTANCE TRAP.

Five motorists were fined £1 each at Canterbury on Saturday for exceeding the 20-m.p.h. speed limit. They were caught in the "new long-distance check for motor-cars."

EXCEEDING LEGAL SPEED.

A fine of £40 was inflicted by the magistrates at Oxted this week on a summons against Colin Defries, Rosetta Gardens Mansions, Chelsea, for driving a motor-car at a speed of thirty-two miles an hour on the Eastbourne road near Godstone. The defendant gave notice of appeal.

Half a dozen motorists have been fined 40s. each at the Ewell Petty Sessions for exceeding the legal limit on the Ewell Road.

At Woking on Saturday £22 was the total of the fines imposed on four motorists for exceeding the legal limit.

On Saturday, six drivers of motor vehicles were summoned to the Spittlegate (Grantham) Petty Sessions to answer charges of exceeding the twenty mile limit on the Great North Road. All were fined.

On Monday four motorists were fined £3 each at the Shoreham Petty Sessions for exceeding the legal limit at Southwick.

Tom Bates, chauffeur to Earl Fitzwilliam, was charged at Retford, on Monday, with exceeding the ten mile speed limit of the borough, on the London road, on April 3rd. Mr. Staplee Firth (London) defended and Mr. E. S. Spencer prosecuted for the police. P.-c. Hollis said he was standing in Dominic Cross-roads, two or three yards from the end, with Sergeant Wilson, when he heard a car, and went back to the corner of the road. He saw the vehicle pass in the direction of Tuxford, from Retford, numbered L.C. 3070, and estimated the speed at from sixteen to eighteen miles per hour. The defendant said his speed at the point named was not more than five or six miles an hour. Earl Fitzwilliam corroborated, but the Bench fined the chauffeur £2 10s. and costs. Notice of appeal was given.

THE price of Mr. S. T. Robinson's Weigel chassis entered in Class F, of the open section of the Irish A.C., is £495, and complete £570, a slight correction of the figures given officially in our last issue.

FROM the Coventry Chain Company, Ltd., Coventry, comes a copy of their latest reference show-card, which gives in tabular form a list of all the leading British, Continental and American motor-cars, together with the size and dimensions and price of the Coventry chains suitable for the same. The firm have endeavoured to draw up a complete record of chain-driven automobiles, and the chains suitable for them, and, judging from its length, we should think they have succeeded. The Coventry Chain Company will be glad to forward one of the cards to anyone upon request; they should prove invaluable on the walls of the garage or repair shop.

CLAIM AGAINST A MOTORIST DISMISSED.

JUDGE EMDEN, sitting at Bromley (Kent) County Court on the 8th inst., commented upon a claim for damages for personal injuries and damages to a handbarrow made against Mr. John Dewrance (a member of the A.A.), of Chislehurst, by William Phillips, a costermonger. On February 7th, 1908, Mr. Dewrance's chauffeur was driving his employer and two friends towards London, down Mottingham Road, Mottingham, in a White steam car, when, perceiving, some sixty yards ahead, a covered van (pointed towards London) and a costermonger's barrow (pointed the opposite way) standing still on the near side and middle of the road respectively, and obstructing the way, he sounded his horn vigorously. The van moved slowly ahead of the two costermongers in charge of the barrow, one skipped on to the roadside and the other pushed his vehicle a few paces forward and then, flinging it away from him towards the car, was alleged to have hurriedly followed the example of his companion. In spite of this manoeuvre the chauffeur managed to clear the barrow by about twelve inches. Mr. Dewrance received a claim for damages "arising" out of the "collision," and decided, in the interests of motoring, to defend the action subsequently entered.

The plaintiff, in giving evidence, said the back wheel of the car hit the wheel of his barrow and "jumped over," and he himself was flung violently against the iron fence; in consequence of the injury to his arm and the "loss of his barrow" he had been prevented from following his employment. Mr. Walter Stewart (instructed by Mr. T. E. Crocker) appeared for Mr. Dewrance, and elucidated in cross-examination that the barrow did not belong to the plaintiff at all, but was hired, and that there was nothing to prevent his hiring another. The evidence of the defendant and his friends was to the effect that the barrow had not been touched by the car, that the plaintiff and his companion were at least three yards from the car as it passed the barrow, and that there was no iron fence against which the plaintiff could have been thrown had the accident occurred.

The judge, in giving judgment for the defendant with costs, said the case was a trumped-up one of the very worst description. He did not believe there had been any accident at all.

ROAD REPORTS.

HAMPTON.—The Hampton Wick District Council have decided to ask the Middlesex County Council to apply to the Local Government Board for an order limiting to ten miles an hour the speed of motor-cars passing through the district from Normansfield Avenue, along the Hampton Court Road, to Hampton Court Green.

LANCASHIRE.—Motor traffic is alleged to be responsible for an increase of £13,152 in the estimates for main roads which have just been adopted by the Lancashire County Council. Alderman Shuttleworth stated that to lessen the dust evil would cost a sum equal to the increase now asked for. He asked the Council to grant £500 for experiments in dust palliatives. This was granted.

WARWICKSHIRE.—At the last meeting of the Warwickshire County Council the Marquis of Hertford proposed that seven and a quarter miles of the Birmingham and Coventry road be made up with a good foundation of slag, and that as far as practicable a tar compound binding material be used. The cost of work was estimated by the Roads and Bridges Committee at about £15,000. One speaker said that whilst they spent £20,000 extra on the roads they made only £700 or £800 a year from motor licences in the county. The chairman, Mr. J. S. Dugdale, K.C., thought they ought to have motor turnpikes to levy tolls on automobiles, as was formerly done with traffic generally. Ultimately the resolution of the Marquis of Hertford was carried.

READING.—We are requested by the hon. sec. of the Berkshire A.C. to point out that recent timings and prosecutions which have taken place at Reading have nothing whatever to do with the county police. The police trap in Reading, which is worked by the police of the borough, is along the Bath road, at the entrance to the town from the West. All motorists, notwithstanding the breadth of the roadway, should, on reaching the borough boundary, drive into and through the town with more than ordinary precaution.

MITCHAM.—At Mitcham there is a police trap which is in frequent operation, in consequence of which four motorists appeared before the Croydon County Bench on Saturday, a fine of three guineas and costs being inflicted in each case.

WANSTEAD.—The measured furlong at Woodford Road, Wanstead, is frequently in operation by the police, particularly at the week-ends.

WEST SUSSEX.—At the meeting of the West Sussex County Council the county surveyor has drawn attention to the fact that the old system of water and grit binding is by no means economical in view of the development in motor traffic. He suggests more expenditure on tarring.

NEWHAVEN.—Application is to be made to the L.G.B. by the East Sussex County Council to impose a speed limit of ten miles an hour on motor cars on the road leading through the town of Newhaven from the junction of the Lewes and Brighton roads to the junction of the road leading to the harbour on the east side of the railway crossing.

BOLTON ABBEY.—The Skipton Rural District Council is calling upon the County Council of the West Riding of Yorkshire to "tar spray" the roads leading to Bolton Abbey in order to mitigate the clouds of dust caused by the many motor-cars taking visitors to that famous spot.

NORTHALLERTON.—The Urban Council of Northallerton has resolved to ask the County Council to make a new bye-law limiting the speed of motor-cars driving through Northallerton to ten miles an hour.

AUTOMOBILE ACCIDENTS.

A COLLISION between an electric tramcar and a motor-car owned by Mr. Francis Back, of Harrow Weald, at Isleworth, occurred on Saturday. The motor-car was borne along several yards by the tram, and the occupants managing to retain their seats were little the worse for their exciting experience beyond the shock they received. The car, however, was seriously damaged.

EARLY on Sunday morning a motor-car and a cab collided at the bottom of Adam's Hill, on the outskirts of Nottingham. The impact precipitated the occupants of the automobile into the road. Two were so severely injured that one died soon after admission to the Nottingham General Hospital, and the skull of the other was fractured.

ON Sunday a motor char-a-banc plying between Brighton and Rottingdean capsized when returning from the latter place, and six persons were injured. Four were taken to the hospital in a motor-bus, and the other two were conveyed thither in a motor-car by the owner, Mr. Colin Defries, of London.

THE coroner and jury at Guildford concluded their inquiry on Monday into the death of John Bryan, who was injured on the highway, near Ripley, late on the night of April 24th by a motor-car, and who was discovered dying in the snow at 5 a.m. by the driver of one of Messrs. Maple's motor-vans. Arthur Meston, chauffeur, employed by Colonel Gore, is on remand from Woking Police Court in consequence of allegations made against him in the matter. The coroner's jury returned as their verdict that Bryan was struck by motor-car D3,128, and that death took place in consequence. The jury strongly condemned the reckless driving of the car, and the behaviour of the driver in not stopping when he felt a jar near Ripley. The coroner had previously pointed out to the jury that he did not think the evidence before them was strong enough to justify a verdict of manslaughter. They had good evidence by which to identify the car, because the top of the lamp found in the road at the scene

A Fleet of Cars leaving the Garage of Messrs. Norman Crossland and Co. in Bury New Road, Manchester, to assist Mr. Joynton Hicks, M.P., Chairman of the Motor Union, during the recent Election in North-West Manchester.

of the tragedy fitted the broken lamp discovered in the garage, 65A, Bolton Mews, South Kensington, where the police found Meston and the car D3,128, and it also corresponded with the other lamp on the car. There was no evidence before them to show that the man who drove the car drove it negligently. Because a man had an accident on the road and then ran away the jury could not make it manslaughter.

In Church Road, Addlestone, on Tuesday a motor-brougham, driven by Harry Bland, chauffeur to Mr. Trevor Williams, Clock House, Byfleet, ran into a group of five persons standing at the side of the kerb. Two men were knocked over and slightly injured. Two boys were dragged some distance and slightly bruised. As the result of the collision with the kerbstone the front wheel of the brougham was broken and the vehicle otherwise injured.

A motor-car accident, causing some excitement, happened on Sunday opposite the Manchester Carriage Company's stables in Rusholme. At this point there is a compulsory stop for electric tramcars. One tramcar had just pulled up at the "stop," and a number of passengers were endeavouring to get aboard when a motor-car ran into them. At least six persons were knocked to the ground, and three were severely hurt and had to be medically attended. The police were quickly on the spot, and it was found that the brakes and chain of the motor-car had been broken in the effort to stop.

DR. BAWTREE, of The Lodge, Maldon, Essex, who had a Coventry Humber for a year, writes that he found it very satisfactory. "I have had the car out in all weathers and on very bad roads. It does, on my ordinary rounds, about eighteen to nineteen miles per gallon of petrol, and about twenty-three to twenty-five miles on a longer run. The car has done about 7,000 miles."

FORTHCOMING EVENTS.

MAY.

- 16th (Sat.).—Fifty miles Consumption Trial of the Hertfordshire C.A.C. Liverpool A.C.'s opening meet of the season. Auto Cycle Union hill climb. Liverpool A.C. first meet of the season. New Forest A.C. club run to Brockenhurst. Sheffield A.C. meet at Langsett 3.15 p.m., for run over Woodhead and via Glossop to Snake Inn. Inter Club meet at Ashby-de-la-Zouch. Lunch of the Kent A.C. at Tunbridge Wells, in connection with the A.C. examination at the Spa Hotel.
- 21st (Th.).—25th.—Reliability Trial of the Irish A.C.
- 17th (Sun.).—Targa Florio Race.
- 23rd (Sat.).—Clipstone race meeting of the Notts A.C. Meeting of the Yorkshire A.C. at Helmsley. Meet of the Motor Union at Bournemouth. Motor Cycling Club—Albert Brown Challenge Cup for cars. Meet of the Sheffield A.C. at the Royal Oak at Edwinstone 2.30 p.m.
- Sir C. B. Locock, Bt., will entertain the Essex C.A.C. at Braintree. Meet of the Kent A.C. at the Mote House, Ightham.
- 25th (M.).—Industrial Vehicle Competition of the A.C. de France.
- 26th (Tu.).—Motor Gymkhana on the links of the Ross Golf Club at Alton Court—Mr. T. H. Coombes, "Montrose," Ross, is the hon. secretary of the event.
- 28th (Th.).—Visit of the Aero Club to Aldershot.
- 30th (Sat.).—Meet of the Herts C.A.C. at Hatfield Park. Devon and Cornwall A.C. hill climb at Moorahop, Tavistock. Lancashire A.C. speed judging contest. Open hill climb of the Auto Cycle Union up the Sutton Bank, in conjunction with the Newcastle and District Motor Cycle Club.
- 31st (Sun.).—Southend M.C. run to Saracen's Head Hotel, Dunmow. Penalty run of the Southern M.C. to Goring.

JUNE.

- International Aeronautical Federation conference in London.
- 5th—6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
- 6th (Sat.).—Brooklands A.R.C.
- 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot. Start of the International Touring Car Trial of the R.A.C. Brooklands A.R.C.
- 9th (Tu.).—Touring competition for Prince Henry of Prussia's prize begins.
- 11th (Th.).—Start of the International Touring Car Trial of the R.A.C.
- 13th (Sat.).—Hill climb of the Notts A.C. at Oakmoor. Speed Trials of the Linca. A.C. at Grimsthorpe. N. Middlesex A.C. speed judging competition for the Gamage Cup. Essex C.A.C. hill climb at Bottledown Hill, Billericay.
- 14th (Sun.).—Mont Cenis hill climb for voiturettes.
- 15th—19th.—Scottish Reliability Trial.
- 17th.—Close of Prince Henry Touring Competition in Germany.
- 18th (Th.).—Meet of the Cambridge A.C. at Hatley Park by invitation of Sir C. Hamilton.
- 20th (Sat.).—Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg. Annual Hill Climb of the Bristol and Gloucestershire A.C.
- 27th (Sat.).—Saltburn beach races. Buxton meet of the Manchester, Sheffield, and Lincolnshire clubs. Members of the Cheshire A.C. will participate in the Gymkhana of the Manchester A.C. Visit of the Essex C.A.C. to Audley End.
- 28th (Sun.).—Southend M.C. run to Grand Hotel, Clacton.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
- 6th (M.).—Grand Prix A.C.F. (Voiturette section).
- 7th (Tu.).—Grand Prix A.C.F. on the Dieppe Circuit.
- 8th (W.).—Meet of the Cambridge A.C. at Wareley Park by invitation of Col. Duncombe.
- 11th (S.).—Provincial meet of the R.A.C. at Hereford. Essex C.A.C. gymkhana at Brentwood.
- 16th (Th.).—Club meet of the Notts A.C. at the Hop Pole, Ollerton.
- 18th (Sat.).—Annual Gymkhana of the Herts C.A.C. at The Grove, Watford, by permission of the president, the Earl of Clarendon.
- Meet of the Liverpool and Cheshire A.C.'s at Delamere. New Forest and Dorset A.C.'s joint hill climb. Hill Climb of the Essex C.A.C.

THE CHAUFFEUR—BY MR. RUDYARD KIPLING.

MR. RUDYARD KIPLING contributes to "The Flag," the book of the Union Jack Club just published, a curious scene from an imaginary play, "The Marred Drives of Windsor," in which he represents Falstaff as a motorist, and makes the worthy knight speak his mind freely of Prince Hal's French chauffeur, Dumain:

Dumain? Hang him for a pestilent, chicken-chopping, hump-backed, leather-batted, poke-eyed, muffle-gloved ape! He hath been fined as often as he hath broken down; and that is at every tavern 'twixt here and York. Dumain! He's the most notorious widow-maker on the Windsor road. His mother was a corn-cutter at Ypres, and his father a barber at Rouen, by which beastly conjunction he rightly draws every infirmity that damns him in his trade. Item: He cuts corners niggardly and upon the wrong side. Item: He'll look behind him after a likely wench in the hottest press of Holborn, though he skid into the kennel for it. Item: He depends upon his brakes to save him at need—a death-bed repentance, Hal, as hath been proved ere this, since grace is uncertain. Item: He is too proud to clean the body of her, but leaves the care of that which should be the very cote-armour of his mechanic knighthood to an unheeded ostler. Thus, at last, he comes to overlook even the oiling; and so it falls that she's where she must be, and not where thou wuldest have her. Ay, laugh if thou wilt, Hal, but a round worthy knight need not fire himself through three baronies in eight hours to know the very essence of the petard that hoists him. Dumain will one day clutch thee into Hell upon the first or lesser speed.

COMPANY NEWS.

NATIONAL MOTOR CAB COMPANY.—£200,000. Agreement with Comptoir Commercial et Industriel, and to carry on business of owners and manufacturers of and dealers in motor-cabs, &c.

BUSINESS NEWS.

At the third 1908 Brooklands Meeting, on the 9th inst., six of nine races were won by cars using Shell motor spirit.

At the meeting at Brooklands on Saturday last the majority of the winning cars were fitted with Dunlop tyres.

THE Rover Company, of Coventry, have now adapted the Rover 6-h.p. car to the requirements of all kinds of tradesmen as a very neat delivery van. The carrying capacity is about forty-five cubic feet.

ON Wednesday last an auction sale of motor-cars, tyres and accessories was held by the London and Paris Exchange Motor Agency, Ltd., at their headquarters in Shaftesbury Avenue, W.C.

A BOLD and distinctive calendar drawing attention to the merits of the "Shell" motor spirit has been issued.

MR. E. E. WAGSTAFF, of Melbourne, Australia, has written to the Daimler Company stating that he has recently completed a 900 miles trip through the West and North-Western districts of Victoria, across the border into South Australia as far as Mount Gambier. "During this trip I had to negotiate fifteen or sixteen miles of drift sand. One or two little cars had previously successfully negotiated it, but no one thought it would be possible for me to get my Daimler through. You may be very pleased to hear that I succeeded, and covered the distance from Casterton to Mount Gambier (forty-two miles, including sixteen miles of drift sand, in a little over three hours. During that period I got bogged in the sand three times, but, having carried a spade, I got out without damage. I am writing this to you, not that it is any great feat, but to give you some idea of the conditions that have to be negotiated occasionally in Australian back blocks."

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notices will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

[No. 481.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

ON Monday Sergeant Waghorn gave a good descriptive account of the system of timing motorists as developed by himself and his colleagues on the Brighton road. It will be remembered that on Good Friday, Easter Sunday, and Easter Monday, the East Sussex police adopted what is known as the "long distance trap" on that road. The timing was done from Patcham in the south to the parish of Slaugham in the north of the county, a distance of rather more than 13 miles, or, to be precise, 13 miles 40 yards. Sergeant Waghorn and the police constable were stationed in a cottage at Patcham and had to take the numbers of the cars from the rear, having a view of about half a mile of the road. The time and "who was driving" were recorded in a book. The watch was hanging up before them. They timed as many cars as they could, whether they were travelling up or down the road, and if two cars passed simultaneously they recorded the heavier car. Then with their precious records they met the police sergeant who had been stationed at Slaugham, at the chief constable's office at Lewes on the Tuesday, and carefully examined the record of the cars. On Good Friday alone 152 were timed, 47 of whom were alleged to have exceeded the legal limit of 20 miles, and 23 to have gone beyond 25 m.p.h. During the three days 80 drivers were found to have gone beyond the 20 miles per hour, and summonses were thereupon issued. Only two of these were heard at Haywards Heath on Monday, so that the justices there have considerable leeway yet to make up, thanks to the renewed police activity in the district. In defending one of those who were summoned, Mr. Marshall Hall, K.C., who was retained by the Automobile Association, pointed out that but for the admission of the motorist himself there would be no proof of identity whatever. This certainly was a strong point which should cause the magistrates to be careful when considering cases in future.

No Reason for Summonses.

that any mishaps had arisen in consequence of the driving of any of the motorists summoned by the police. These facts should be important in any effort to justify the prosecution, but unfortunately they do not appear to enter into the calculations of those responsible either for taking action or deciding penalties.

Chief Constables against Police Traps.

country, the gathering was also attended by many of the mayors of the leading cities. Considerable interest was aroused in the

IN connection with these cases, which are likely to prove so very profitable to the county, it should not be overlooked that no suggestion has been made that any of the motorists were driving to the common danger; nor was it even hinted

remarks of the Marquis of Winchester with regard to the regulations under the Motor Car Act. He was, it will be remembered by our readers, a member of the Royal Commission, and therefore considerable importance attaches to his opinion that criticism of the speed of motor-cars had scarcely been fair up to the present. He rightly pointed out that a high speed was not in itself necessarily a source of danger in the country, where the road was straight and open. The majority of the members of the Royal Commission on Motor Cars had come to the conclusion that for the police and the public the right course to pursue was to prosecute any cases of driving to the common danger. At a later stage of the meeting this point was reverted to by Mr. Peacock, the Chief Constable of Manchester, who said that he had recommended the Watch Committee of that important centre not to apply for a speed limit. Experience had proved that such a course was the wise and proper one. During the whole of the four years that the present Act had been in operation he had summoned no person for driving a motor vehicle at excessive speed, but had restricted his attention to those who drove to the common danger. Like the Chief Constable of Belfast in his evidence before the recent speed inquiry in that city, Mr. Peacock has no sympathy with the policy of setting traps for motorists.

Manners on the Car.

At the same important meeting, Mr. J. H. Thewlis, the chairman of the Manchester Watch Committee, drew attention to the habit that some chauffeurs have of smoking while driving, and said he would go so far as to suggest the prohibition of such a practice, as their attention might otherwise be distracted at a critical moment. To those who are familiar with the fashionable thoroughfares of great cities the advice is certainly sound, and professional drivers who are anxious to raise the prestige of their calling should be willing to forego such habits when driving through towns. There is nothing so undignified as to see the driver of a car carelessly smoking a pipe while at the wheel, and common sense as well as regard for appearances should lead to the practice quickly falling into discredit. If ordinary consideration does not lead to such a result the suggestion of Mr. Thewlis should not be overlooked.

A Speed Limit Inquiry in Scotland.

AN inquiry on behalf of the Secretary for Scotland regarding the application by the Helensburgh Town Council to have the speed limit of motor-cars restricted to ten miles within certain streets of the burgh has been held. The Scottish Automobile Club, with characteristic care for the rights of motorists, went to considerable trouble and expense in order that the case against the proposed imposition should be placed clearly and properly before the authorities. The whole length of the streets in the burgh is twenty-five miles, and the Town Council asked that restriction should be made over nearly seven miles. It appears there are 210 motor-cars registered in the county, and of that number twenty-two belong to local people. Apparently the police did not have much complaint against motorists residing in Helensburgh, but animadverted on the conduct of others from Glasgow and throughout the country who apparently were little deterred by fear of the law. This

part of the case, however, should not seriously affect the issue seeing that last year only fourteen motorists were prosecuted for offences against the Act. In the course of the enquiry Sir John H. A. Macdonald gave evidence against the proposed restriction, and Major M'Farlane, the director of the Garloch Motor Service Company, Ltd., said that the restriction of the speed would seriously affect his company and impair the usefulness of the motor service they had been able to develop for the benefit of the people. After two long hearings the matter has been referred to the Secretary for Scotland, and whether he adopts, or refuses to grant, the suggestions of the Helensburgh Town Council, the Scottish Automobile Club will have the satisfaction of knowing that their views were admirably voiced.

The R.A.C. Associates' Badge.

CONSIDERABLE dissatisfaction is felt by members of the R.A.C. with regard to the badges of the Associate members of that body. As will be seen from the accompanying illustration, this, with the exception of the crown at the top of the badge, is identical with that of the members of the Club. The latter have to be elected, while anyone can become

THE R.A.C. ASSOCIATES' CAR BADGE.

an Associate merely by the payment of a guinea. Hence the feeling aroused by the latest action of the R.A.C., which will tend to discourage the sale of the original badge to members of the Club.

An American Club's Run.

ONE of the favourite forms of club enterprise in the United States is the organisation of two-day reliability trials of various kinds with the idea of keeping touring cars up to the standard. Among these events the Harrisburgh Club's run is of considerable importance. Last year no fewer than four cars tied for first place. These were the Pierce, Thomas, Pullman and White. At that time it was decided to engrave the names of all four on the cup and hold it until this year, when the same make of car, entered by the same owner, that made the best score this season would win it. The run, at the beginning of the month of May, was 174.7 miles the first day with a running time of 8 hrs. 50 min. The cars were all sealed, and each carried an official observer. The second day's run was 142.4 miles and the running time was seven hours. At the end of the first day's run there were fifteen perfect road scores, and at the end of the second day there were but seven. The roads were typical Pennsylvania roads, very good in some places and very bad in others, with a great many water breakers and loose stones. At the close of the run there was a technical examination, which was a very searching one. The result of the scrutiny was that they passed the White steam car as being in perfect condition,

which, together with the perfect road score, won the White Company the prize.

The R.A.C. Chairmanship.

MOTORISTS generally will regret to learn of the resignation of Mr. C. D. Rose, M.P., from the chairmanship of the Royal A.C., to which he was recently re-elected. He will be absent from England for some time, and is already on his way to Canada, so that it would have been impossible for him to have continued office with the devotion that has characterised his occupancy of one of the most important posts in the automobile movement. During the whole of the period he has been associated with the R.A.C. Mr. Rose has tactfully and admirably directed its work, with the result that his colleagues on the committee have formed the highest opinion both of his abilities and his character. And only when he made it clear that his continuance at the helm was really impossible did they accept the inevitable resignation. At the same time they adopted a resolution to the effect:—That Mr. C. D. Rose, M.P., be asked to accept a vice-presidency of the Royal A.C., in recognition of the unique services he has rendered to the club and to the whole automobile movement.

Prince Francis of Teck.]

IN these circumstances a successor had to be found, and, on the proposition of a sub-committee of past chairmen and present vice-chairmen of the club, the General Committee have unanimously invited H.S.H. Prince Francis Joseph Leopold Frederick of Teck, K.C.V.O., D.S.O., to become chairman of the club. Consent has been obtained, and thus the club will again possess as chairman one who has given ample evidence in other directions of whole-hearted interest in any work he takes in hand. Prince Francis of Teck is the second son of the late Duke of Teck and a brother of the Princess of Wales. After being educated at Wellington and Sandhurst Prince Francis joined the 1st Dragoons in 1890, when twenty years of age, and was a captain in the Egyptian Army in 1897. Later he became A.D.C. to the General Officer commanding the South-Eastern District, and served with distinction in South Africa in 1899 and 1900. In 1902 he retired from the Army. The recreations of the new chairman of the R.A.C. are hunting and shooting, and motoring will now claim a large share of his leisure.

A "Prohibitive" Suggestion.

REALLY the Scottish A.C. should send their Hand-book to Mr. Cathcart Wason, M.P., whose persistent questionings with regard to motor matters are a feature of Parliament. He has just suggested that as the speed limit of twenty miles an hour under the Motor Act of 1903 was "entirely ignored by owners, drivers, and manufacturers," high-speed cars should be taxed at a prohibitive rate next year. In reply to this suggestion the new Chancellor of the Exchequer writes that the taxation of motor-cars is a subject to which he is giving careful attention, but the policy of His Majesty's Government is not to impose taxes for purposes other than that of raising revenue, and this object was not conveniently attained by imposing taxes which were prohibitory.

The Motor Unionist's Maiden Speech.

MOTORING similes often occur to the politician who is constantly being urged by his constituents or by his election-committee to be wary. Naturally in his maiden speech in the House of Commons on Monday, Mr. Joynson-Hicks—who, by the way, had regretfully to absent himself from the chair of a Motor Union committee to be in attendance at Westminster—drew upon the automobile for an illustration. Speaking of popular control in connection with the education controversy he said he was reminded of a friend who recently came under the notice of the police for not having had his motor-car under

popular control—he meant proper control. He said the car was under perfect control. Then why, he was asked, run into the lamp-post? “Oh,” he replied, “there is a slight defect in the steering gear, but the machine is under perfect control as long as I turn to the left.” So, in the eyes of the Government, popular control, &c.—we are not a political journal, so cannot give the rest of the quotation.

Fees and Roads.

A MEETING of the Dumfries County Council has been held, at which Mr. A. H. Johnstone-Douglas, from the chair, moved that they make a representation to the Secretary for Scotland and the Chancellor of the Exchequer for an increase in the licence duty on motor-cars, and for the licence duty on these and other vehicles being applied to the maintenance of

and the motor-carriage is a friend of animals in relieving them of burdens and the stress of hard labour. At the same time it is significant that all the old-established carriage building firms in Exeter, Plymouth, and the other leading towns of Devon have given attention to the automobile—probably as a means of self-preservation.

A Good Handbook.

THE Scottish Automobile Club may be heartily congratulated upon the comprehensive and convenient form of their yearbook for 1908-9. Its contents include the usual club information, list of members, &c., while the summary of legislation, particulars of licensing, &c., are lucid and authoritative. Information with regard to hotels, pits for inspection purposes, and the supply of petrol are set forth with a fulness

Motoring under Difficulties.

The illustration reproduced above depicts Mr. C. I. Thornton, the well-known cricketer, passing through Bridge Street, Maidenhead, on May 1st last on his 60-h.p. Berliet. A few days previously he had had an equally unique experience, having been delayed on the road by a snowdrift.

highways. We do not like this association of the notion for an increased licence fee with the upkeep of the roads. Surely the fees for registration and licensing are already sufficiently high without increases being advocated in order to meet the expense of road upkeep. Will the Scottish A.C., which has had remarkable success in educating the councillors of Lanark, continue its useful propaganda into the county of Dumfries?

Carriages in Devon.

AN expert in the carriage-building industry has said that the members of his craft located in Devonshire have suffered less from the automobile than those in other parts of the country. He claims that the county has a larger carriage-using population than any other English shire, and that its hills have prevented the more general adoption of the motor. The latter is just the reason that should have secured its advance; for the strain on horses is greatest in such districts,

that is both useful and unusual. Information is also given as to the ferries in Scotland, with the charges for cars passing over the same, these ranging from 2d. at Govan to 12s. at the Dornie Ferry in Ross and Cromarty. Full lists of repairers are also included, and the value of the book to those who are touring in Scotland is enhanced by several pages of selected main roads reproduced by arrangement with the publishers of the Contour route book. This little book is of a compact form and convenient size for the pocket.

AN indication that the summer season, the period of motor trips, is now at hand is afforded in the receipt from Messrs. Dennis Brothers, Ltd., of a couple of photographs, one showing a 28-h.p. twenty-seated char-a-banc with glass shield, which was last week supplied to Mr. Steadman, of Princes Street, Doncaster, and another of a char-a-banc, painted cream, lately delivered to Messrs. A. W. Jackson and Sons, of Hall Gate, Doncaster.

A RUN ON THE 40-H.P. ARGYLL.

SOME weeks ago I decided to possess a new car, but the weather was so atrociously varied and so undoubtedly tearful when it became settled for a few hours that the day of possession was delayed. Meanwhile I looked up goggles, inspected lamps, learned the whole gamut of harmony on horns, whistles, and syrens, took lessons in vulcanizing, and even practised Patience—a virtue that is needed on the road when the motorist has no spare wheel and his tyre has punctured. I intended to buy one of three vehicles, but was undetermined until the other morning the sun broke through the sky and heartened the men in the motor industry. For it encouraged the novices to take their trial runs, and incited the ladies to discuss the advisability of prompt decision as to the selection of some particular car.

I must confess, although not a Scot, I have a partiality for an Argyll, for on one of the reliability trials held north of the Tweed I had enjoyed some good trips on the 14-16-h.p. vehicle of that type. And the car that could get over some of the hills that we negotiated in that event could be safely trusted in

The 40-h.p. Argyll in a Buckinghamshire Byeway.

our more monotonous landscape. So I rang up the London home of the Argyll, to arrange for a trial run on a car—not, however, a car of small degree, but one of 40-h.p. This vehicle has become famous since it was illustrated and described in the *M.C.J.* of November 2nd last year. It has a four-cylinder engine, the cylinders, 120 mm. bore by 140 mm. stroke, being cast in pairs, and the carburettor is one of the interesting features of the vehicle. By means of the improved device it is possible to alter the proportion of air to petrol while the engine is running and thus obtain the best mixture, according to the temperature and weather. It is also possible to shut off all connection with the petrol jet and allow only pure air to be drawn into the engine. So that, in addition to the increased braking power provided, cleanliness is secured, oil cannot be sucked up into the cylinders, and any deposit of carbonised oil on the pistons and plugs is removed. The well-known Argyll multiple disc design of clutch is retained, but the change-speed gear, giving four speeds and a reverse, has points of interest which have proved their value in practice. The direct drive is on the third, being obtained by sliding the clutch on the main shaft into mesh with the clutches on the

third speed wheel. But, as the full details of the car have already been published, let me get along to the run I enjoyed the other day—a fifty mile trip to freshen one after lunch.

The trip was from London to Milton's country. Following the Acton tramlines for several miles, we ran through Hillingdon, and beyond Uxbridge we crossed the Colne, entering the quiet county of Buckinghamshire—a region of handicraftsmen, and of historical associations when King and people were in less mutually friendly mood than now. A mile beyond the extremity of the tramlines we might have turned for Denham, with its Elizabethan house in which Charles II. was hiding for awhile from his pursuers; but the better road to test a car is that to the right at the third milestone. This is a twenty-five mile stretch to Aylesbury. And so we left the Oxford road at that point, and along a winding narrow lane, where traffic is fortunately scarce, and, happily, no vehicles were coming our way, Chalfont St. Peter is reached. It is but a mile from the Jordans, where the grave of William Penn attracts many Americans to see the resting-place of the founder of Pennsylvania, and a little local excitement can be got from the water-splash formed by the meandering little Misbourne. Chalfont St. Peter is described in some of the guide books as the "prettiest village in England." It may have been; but it is not now. From thence to Chalfont St. Giles is but a two-mile run, with a loose bit of road. The illustration, on the opposite page, reproduced by permission of the Great Central Railway, gives a good idea of the hamlet. In front of the church, with its lych-gate of oak, is a duckpond, with eight or nine immigrants from Aylesbury, and a consequential swan—ill preserving his dignity amid the somewhat murky surroundings. A few yards along is a cottage with diamond paned windows, broad chimney stacks and red tiles, that has the distinctive character of age. There Milton sojourned while the plague raged in London—then further away than now—and wrote the conclusion of "Paradise Lost." The little garden runs parallel with the road, from which it is separated by a low wall, over which we can see the little windows of the room where the poet dictated to his amanuensis. In the visitors' book are the names of some American visitors and many English guests—apparently, all who come to London from the United States do not come into the Milton country. The roads are good; there are no ascents worth mentioning when the car employed is an Argyll, and the characteristic pastoral scenery of the locality is pleasant enough when the weather is genial. Turning from St. Giles to reach London by way of Rickmansworth—where the Swan Hotel provides good fare for man and very fair accommodation for motor-cars—we go on a cross-road that certainly demands the attention of those motoring organisations that concern themselves with road questions. It is certainly dangerous, even beyond the risk of most cross-roads, and the sooner warning signs are placed the better the residents round about should be pleased.

From Rickmansworth the way is through Northwood, and by the fourteenth century church of Pinner, skirting Harrow, with its church on the crown of the hill, 400 ft. high; thence by the Welsh Harp, which is "Endon way," into London, which was a good, quick run. Into Maida Vale and along the Edgware Road the trusty Argyll strode. To test the flexibility of an engine under traffic conditions a main London thoroughfare, with all the stops that arise from the vehicles coming from side streets, is an ideal condition of things. And we got to the Marble Arch in good style, manœuvring round the improved roadway with almost juvenile pleasure; for there are no two opinions as to the advantage of the work that has been done in isolating the Marble Arch from the Park and rendering so much more roadway available for the increasing traffic. Nor can there be any doubt as to the Argyll's easy running as a carriage, while it is distinctive among modern cars for its quiet behaviour.

JOHN HAMPDEN.

MESSRS. R. M. WRIGHT AND Co. are about to introduce motor taxi-cabs into the city of Lincoln.

NOTES FROM HARROGATE.

NOWHERE are the outward changes brought about by the evolution of the motor-car more strongly marked than in Harrogate—the motor Mecca of the North. Evidences of this were seen last week-end. Time was—and that comparatively recently—when a string of private carriages and pairs encircled the famous Sulphur Well building whilst titled owners took the waters, but now one of Harrogate's early morning sights is to witness spick-and-span motor-cars luxuriously appointed glide up to the Sulphur Well, and to watch the cars circle round the old building like so many swallows until mi-lord and mi-lady have drunk the prescribed quantity of sulphur water and are ready to again enter their cars. At the Royal Baths special accommodation has been provided for motoring patients. The motorist may drive up to a special entry in his or her car and step out into a sort of Sedan chair on wheels in which they may be run to their respective baths and return the same way to their vehicle without putting foot to floor.

LAST week end the Right Hon. Earl Poulet motored over from his Somerset estates in a 75-h.p. Fiat, putting up at the Grand Hotel. His lordship is staying three weeks and expects to cover a lot of local ground during his visit. Harrogate possesses great fascination on account of the variety of country which may be so readily tapped in the neighbourhood. One minute a car may be swinging down a road pungent with the odour of pine trees, and the next issue out on moorland wide-stretching and swept by crisp winds; whilst in another direction one's car may run through miles and miles of rich foliage and beneath avenues of spreading oak and leafy elm.

CAPTAIN C. B. SOUTHEY ran down from Somerset during the week in a 15-20-h.p. live-axle Fiat, and remarked upon the excellent state of the Harrogate roads. As a matter of fact, the Harrogate Corporation spends upwards of £500 each summer in watering the roads with a patent solution to obviate the dust nuisance, and the experiment has been very successful. They are now, however, turning their attention to road-making as a more completely satisfactory way. The road surveyor, Mr. Thorpe, appears to have solved the difficulty of a watertight seal to the roads, and it is claimed under the new method that the roads will go eight or nine years without needing repairs.

To what extent motor-cars have been adopted by the medical profession was seen last week-end, when three hundred members of the Balneological and Climatological Association visited Harrogate for their annual conference, most of whom motored over. There is a distinctly professional stamp about the medico's motor-car. The garages, particularly Johnson's garage at the Majestic Hotel, were at full pressure. Harrogate's strongest claim on the motorist is that motoring has been recognised as a supplementary aid to the water cures. It has become a psychologically established fact that a patient is all the better for having a soothing mental stimulant such as gentle motoring under the ideal conditions which prevail. Harrogate, it should be understood, stands on the highest tableland in England, and the salt of the sea breezes which may blow from either east or west is sweetened by the moorland air.

THE opening meet of the Yorkshire Automobile Club's season at Harrogate is already having a good effect, as witnessed during the past week in the ready welcome given by the business section of the community to the fleet of twenty motor-cabs introduced by the Provincial Motor Cab Company. It is less than a year ago since the same business houses objected to the introduction of the motor-buses, so this educational broadening of views is all the more striking.

It is recognised that a great attraction to motorists is the magnificent hotel accommodation to be found in Harrogate. Indeed, it has been said of these mammoth hotels, which are modern erections, that the garages were first built and then the picture filled in as seen through a pair of motor goggles; but, whether that is so or not, the motorist who makes Harrogate his

or her head-quarters finds the hotel life, with its social amenities, particularly alluring. The efficacy of building up the mental as well as the physical forces of visiting patients has prompted the municipality to erect a beautiful Kursaal, where a high-class orchestra, under the conductorship of Mr. Julian Clifford, plays morning, afternoon and evening, with frequent special concerts, and the stream of private motor-cars from the hotel to the Kursaal bears eloquent testimony to the combined mental and physical cures in progress. The Mayor of Harrogate (Dr. Neville Williams) is himself a keen motorist, and municipally, as well as in other ways, the motorist is well looked after.

THE local Automobile Association, which numbers over one hundred strong, have hit on a novel method of mutually benefiting each other. Frequent meetings are held and each member commits a question to paper. The papers are then mixed up and drawn, and each member in turn is expected to answer the question which has fallen to his lot, or, if he feels incapable of the task, to select a subject from a number specially put in. In this way a new member may very quickly become a proficient motorist.

THE Harrogate Automobile Association is constantly being approached by letter and by proxy as to which is the most picturesque and desirable route from London to Harrogate, and

The Village of Chalfont St. Giles.

the following is recommended. Starting from the Mansion House, one proceeds along Moorgate Street to Highbury Station, and then follows the Holloway Road on to Finchley. Some stiff hill climbing with an occasional descent meets the traveller *via* Barnet and Hatfield, and so on to Digswell Hill and Welwyn, and then by way of Woolmer Green and Knebworth, with easy running over undulating ground, to Stevenage. Taking in Graveley and Baldock on the way, one goes through Biggleswade to Allowbury Weston, and leaving Stilton behind there is a smooth stretch to Wansford Bridge and on to Stamford. Passing Colsterworth there is a gradual climb to Spittlegate Hill, and then a run down to Grantham. From Gonerby one ascends to Balderton, after which level ground with gentle undulations at intervals into Newark is struck. From Tuxford one ascends gradually to East Retford, and then travels over undulating road to Barnsley and strikes consistently level ground through Doncaster. Reaching Wentbridge there is a sharp ascent to Ferrybridge, after which the road gradually rises through Brotherton, Aberford, and so on to Wetherby, then on through the pretty country of Plompton and down Wetherby Lane to Harrogate. For variety of scenery and the mapping out of easy or quick stages I can recommend this line of travel. FREE LANCE.

FOR snowballing two motorists, Mr. and Mrs. Bayer, of Forest Hill, London, five boys were recently fined at Coventry.

B

GOSSIP FROM PARIS.

IN this epoch of taxi-autos plying for hire in almost every city, awaiting the moment when they in their turn will perhaps be supplanted by aeroplanes, it is difficult for young people to realise what the world was like when there was no other means of transport in a town than the sedan-chair. Yet it is not so long ago. Monsieur Justin Caumont, who till 1865 enjoyed the monopoly of sedan-chairs at Bayeux, in the department of Calvados, and who made a considerable fortune by it, has only just died at the age of 94 years. Half-a-century ago that place, Beauvais, and numerous other sleepy country towns, did not possess such a thing as a cab. And in certain parts of France private sedan-chairs were in common use much later. Orleans, which has a population of some 70,000 inhabitants, was one of those favoured cities. A select circle of good old-fashioned people kept up the family tradition of being carried to church in their sedan-chairs. It was, most surely, picturesque, but not, as the French say, *dans le mouvement*. However, when her grandson began driving about in a 50-h.p. automobile, the old lady no longer felt herself safe in her sedan-chair, though it was carried by her footmen, and she abandoned it with regret.

M. CLEMENCEAU and the members of his Cabinet are learning by experience the truth of the French proverb "*Il est*

Miss Maud Allan, the popular dancer impressionist at the Palace Theatre, London, W., has fallen a victim to the joys of motoring, and has purchased a 30-h.p. Car.

With a little experience on the Continent the artiste has proved an apt pupil, but at present she confines her driving to quiet country roads, leaving a chauffeur to negotiate the London streets. In the photograph reproduced above Miss Allan is seen in her new car, accompanied by her parents, the Drs. Allan, of San Francisco.

impossible de contenter tout le monde et son pere" (One cannot satisfy everybody). Not long ago, when the Government bill for the regulation of motor-car traffic was presented to the Chamber, its author, the Minister of Public Works, and all his colleagues were accused of seeking to ruin the automobile industry. Now they are attacked with equal violence by M. Jeramer for committing what he describes as nothing less than "the flagrant iniquity" of protecting automobilism, and of aiming at the prompt "disappearance of the horse." The uproar raised against M. Barthou's bill may have been somewhat exaggerated, but certainly not more so than M. Jeramer's accusations. This gentleman has, however, a good excuse for his explosion of wrath, as he is one of the most direct sufferers by the adoption of the new means of locomotion. His utterances were made at the general annual meeting of one of the big Paris cab companies, of which he is a large shareholder. I do not know whether M. Jeramer, and the large number of his fellow shareholders who applauded him at the meeting, were aware of the fact, but only a few days before a great many Councils General adopted resolutions in favour of substituting mechanically-

propelled vehicles for the old diligences which still exist in so many parts of France. The automobile builders were invited to make proposals, which will be examined at the August session of the departmental assemblies. The noble animal the horse will not, however, disappear, but will, sooner than some people seem to think, be relieved of much of the hard work he has till now had to do. No one should rejoice at it more than his friends.

Now that the Dieppe circuit is closed against all racing cars the French competitors in the Grand Prix are testing their new machines in various parts of France. Cissac and Maurice Farman, having at last received their cars from Messrs. Panhard and Levassor, are scouring the country with them, but neither of those drivers cares to say more about them than that they are very satisfied, and that the vehicles are a great improvement on those of last year. Some of the other drivers boast of having attained incredible speed with their new racers. In drawing the long bow no one has, however, surpassed one driver, who has affirmed that in Burgundy the other day he drove his new racer during sixty minutes at an average speed of 160 kilometres an hour. The average speed of Nazzaro, who on the Fiat car won the Grand Prix last year, was 114 kilometres (71 miles) an hour. If the driver in question can travel at the speed of 160 kilometres an hour, the man who may have the ambition to beat him in the race by only 1 kilometre out of the 770 will have to keep up an average speed of 100 miles an hour!

MR. HENRY FARMAN recognises that the Brothers Wright are expert aviators, yet he does not hesitate to challenge them to a friendly contest, which he believes will convince the most sceptical that the definitive conquest of the ethereal element is no longer a chimera. He is the first man in Europe who on an aeroplane flew away, turned the corner, and returned to his starting point, but he does not pretend to have achieved feats equal to those of which his American cousins—he is an Englishman—boast. Whether he will surpass or even equal the Brothers Wright's performances is a question of secondary importance to the general public, that will undoubtedly heartily applaud the victor, whoever he may be. Mr. Farman has, however, confidence in himself and in his machines, and feels sure that in any case he will not cut a bad figure in the match. The contest must be held over a great open space—not like the Issy les Moulineaux parade ground, where the aviator has to veer round every half-minute. The challenge has been received in France with enthusiasm, not only by the aviators and aeronauts but by the sporting world and general public, that even now really do not know what to think of the American champions.

"LOOK, my dear, at that hulking fellow with a fan riding a bicyclette!" That was the remark made the other day by a young woman sitting beside her husband in a motor-car going at the rate of forty miles an hour in the Bois de Boulogne. It was fortunate for them the man had his fan, and that it was sufficiently big to attract their attention. He jumped off his machine just before the young couple passed and displayed it—not to procure for himself the pleasure of what the fan hawkers on the Boulevard call "*un petit vent du nord*," but to warn the imprudent motorists. Just round the corner, at a distance of about 100 metres, were a couple of cycling policemen waiting in ambush to note infringements of the speed regulations and to prosecute offenders. The display of the fan just saved the young and happy couple from the disagreeable ordeal of a "*procès verbal*" for excess of speed and the consequent prosecution with the inevitable fine. "The hulking fellow with a fan" was one of the agents of the A.G.A. (General Association of Automobilists) recently created in France in imitation of the Automobile Association in England. The duty of its agents is to warn motorists against infringements of the traffic regulations sometimes committed by inadvertence or by ignorance of their existence. The big fans they carry and display in case of need bear various warning inscriptions such as "lantern," "smoke," "slow down," &c.

MARNEY.

CONTINENTAL NOTES.

The A.C.F. Grand Prix Race.

The first of the Renault cars for the A.C.F. Grand Prix event is now on the road, and is being put through its road trials by Siz. As will be seen from the accompanying illustration, the vehicle differs but slightly in general appearance from last year's Renault racers. The three Mors cars for the contest are rapidly approaching completion. The four-cylinder engines have a bore of 155 mm. and a stroke of 170 mm.; the cars have wheel-bases of 9 ft. 9 in. and a track of 4 ft. 1 in.

The Targa Florio Race.

The annual Targa Florio race, which was held in Sicily on Monday last, did not attract so large an entry as last year. In fact, only seventeen cars entered—two Fiats, a Franco, a Junior, a Darracq, four S.P.A.'s, three Italas, three Isotta-Fraschini, a Berliet, and a Züst—and of these only thirteen actually started. The event was for cars having four-cylinder engines of a bore of between 120 and 130 mm., and was held over a winding circuit, about 150 kilometres round; this had to be covered three times, giving a total distance of approximately 450 kilometres, or 281

Baraque hill, near Clermont-Ferrand, when the best time of the day (10 min. 34 sec.) was made by Grillet on the Fouillaron.

British Motorists in France.

Quite a large number of British motorists are just now touring in France. Amongst them are—Mr. and Mrs. Fleming, Cheltenham (20-24-h.p. Fiat); Mr. Earle, Liverpool (45-h.p. Daimler); Mr., Mrs., and Miss Scott Murray (40-h.p. Daimler); Mr. and Mrs. Bradley, London (35-h.p. Fiat); Mr. and Mrs. Scribner, London (24-h.p. Peugeot); Mr. Frank Stoop and family, London (40-h.p. Fiat); Lady Cheylesmore (50-h.p. Panhard); Captain Sir Rosslyn and Lady Wemyss (40-h.p. Mercedes); Mr. Chapman and family, London (40-h.p. Itala); Colonel Kinney (60-h.p. Delaunay-Belleville); and Mr. and Mrs. Seligmann, London (20-h.p. Argyll).

Military Motor-wagons in Germany.

It is reported that, as a result of some recent trials, the German War Office has placed an order with the Suddutsche Automobilfabrik, of Gaggenau, for no less than thirty military road trains, each consisting of a 5-ton petrol motor-wagon and a 2½-ton trailer.

Siz at the Wheel of the Renault Car he will drive in the A.C.F. Grand Prix Race.

miles. The start took place at 6 a.m., the competitors being sent off at intervals of ten minutes. Lancia (Fiat), Trucco (Isotta-Fraschini), Nazzaro (Fiat), and Ceirano (S.P.A.), all finished the first round within 3 min. of each other. At the end of the second round the order was the same, but in the third lap Trucco took the lead, and won on his Isotta-Fraschini in 7 hr. 49 min., Lancia (Fiat) being second in 8 h. 2 min., Ceirano (S.P.A.) third, in 8 h. 9 min.; and Porporato (Berliet), fourth, in 8 h. 22 min. Trucco's time is a record for the race, that of last year's winner, Nazzaro (Fiat) being 8 h. 17 min.

The Tour of France.

The annual Tour of France reliability trial for motor-bicycles, tri-cars, and light cars organised by the Auto-cycle Club de France, which commenced on the 11th inst., terminated on Sunday last, when of the nine motor-bicycles, six tri-cars, six light cars with single-cylinder engines of not more than 84 mm. bore, and thirteen cars with single-cylinder engines of a bore up to 100 mm., which left Paris six, two, six, and twelve respectively, arrived back in the capital after covering a distance of 1,550 kilometres. In the 84 mm. bore car section the Sinpar, driven by Schweitzer, went through without losing any marks, as did also a Fouillaron, a Prima, a Delage, a Stimula, a Demeester, two Ivrys, a Bayard-Clement and a Bozier in the 100 mm. category. The programme on the 13th inst. comprised a 5-kilometre speed trial on the

Miscellaneous Items.

Arrangements are in hand for the inauguration of a public motor-car service between Innsbruck and Kufstein, in the Tyrol. —The Kaiser is stated to have now no less than nineteen cars in his Imperial motor garage.—No less than from eighty to a hundred volunteer motor-cyclists are expected to take part in the forthcoming military manoeuvres in Alsace.—It is proposed to establish a public motor-car service between Karlsbad and Keilberg, Austria.—The annual hill-climbing competition, known as the "Coupe Monod," organised by the Montreux section of the Swiss Automobile Club, over a 6-kilometre course between Montreux and Caux, is to be held on the 24th inst.—Messrs. Laurin and Klement, of Jungbunzlau, Austria, have just completed four motor-buses for a service between Pardubitz, Holitz and Botzdanek.—The Circuit des Ardennes and Coupe de Liedekerke races are to be held on the Bastogne course on August 12th next.—Seventeen entries have so far been received for the Copa Catalunya race for light cars, which is to be held near Barcelona on the 28th inst.—The trophy which is to be competed for in the Prince Henry of Prussia reliability trial for touring cars, to be held in Germany next month, consists of a finely-executed model in silver of a 50-h.p. Benz car.—An attempt is about to be made to establish a new record between Paris and Moscow, on a 40-h.p. Lorraine Dietrich, which will be driven by Messrs. Sorel and Rougier.

THE IRISH TRIAL.

DURING the next few days the Reliability Trial for touring cars organised by the Irish Automobile Club will be in progress. In our issue of the 9th inst. we published a full list of the entries in this interesting event, as well as detailed particulars as to the cars taking part in it. Given good weather it should prove a delightful experience for the drivers, observers and others participating therein. On Thursday the passengers and others concerned with the observation of the vehicles met and were weighed in the garage of the Automobile Club at 34, Dawson Street, Dublin, and on the premises of the Royal Dublin Society. The cars were similarly dealt with in Messrs. McLaughlan and Harvey's Yard, Dartmouth Road, Dublin. From thence they were driven to Ballsbridge—a distance of just over a mile—where they were garaged on Thursday night.

To-day (Friday) the run is from Dublin to Cork, a distance of 173½ miles, the luncheon stop being at Kilkenny. On Saturday the first car will leave Cork at 7 a.m., and is timed to arrive at Killarney shortly before five o'clock, the distance being 171

The Depot of the Auto Agencia Bolhao, Oporto, Portugal, with whom the Daimler Company have recently fixed up an agency for the handling of Daimler Cars in that country.

miles. The route will be *via* Macroom Bridge, up the Pass of Keimaneigh to Glengariff and Parknasilla, where lunch will be taken; hence the journey will be resumed to Rosbeigh, where a speed trial will be made on the Strand. Sunday will be spent at Killarney, and on Monday there will be a run of 184½ miles back to Dublin *via* Limerick for lunch. At Maryborough the course of the Gordon Bennett race of 1903 will be struck, and then after tea at Kildare the road will be taken through Newbridge, Naas and Rathcoole. On Tuesday the journey is 124½ miles north to Belfast by way of Dundalk and Warrenpoint, where luncheon will be taken. On the 27th the cars will return to Dublin by a route of 101 miles for luncheon. In the afternoon a trip of 52½ miles along the Wicklow Hills will bring the cars back to the Ballsbridge premises of the Royal Dublin Society on the conclusion of the Trial.

THE motor house adjoining the Grand Stand at Ascot has been reserved for the use of members of the R.A.C. during the racing that begins on Tuesday, June 16th, and continues until Friday, June 19th.

SOME CURRENT TOPICS.

Commercial Travellers' Vehicles on the Yearly Contract System.

Quite by accident I recently came across a firm in London which is slowly but surely building up a connection in hiring out light motor vehicles suitable for commercial travellers' use. The firm in question is the Portman Garage, of Portman Mews North, Portman Square, W., who for £260 a year, that is £5 per week, not only supply the vehicle, but furnish the driver and the petrol, &c., in fact, for the one payment the users have a vehicle at their disposal for five days in the week ready for an average daily run of fifty miles without any further charge. At present the firm have nine vans available, but these are all so fully occupied that an extension of the fleet at an early date is planned. The cars are mainly used by commercial travellers in the London suburbs, but some of them are employed on relatively long trips—as far out as Chelmsford on the east, and westwards to Windsor. The vehicles, which are of the 8-h.p. single-cylinder type, have, I understand, given general satisfaction, the owners making a point of having them carefully gone over every Saturday so that they will be in perfect running order for the ensuing week's work.

Damage by Self-Ignition.

The thanks of motorists are due to Mr. J. S. Critchley for drawing attention to an unsuspected danger in motor-cars. He has recently investigated two cases in which valuable vehicles were entirely destroyed by fire, the causes of which appear identical, as the flames burst upwards from the under part, and both cars were fitted with long under-trays extending to the back of the gear-box, in which the exhaust pipe was also inclosed. "The cause was evidently due," he writes, "to the collection of petrol in the trays, leaking from the carburettor or supply pipes, and which was ignited by the heat of the exhaust pipe, or, perhaps, a spark from the brakes. In the one case, however, the latter could not be the cause, for the reason that the car had been travelling up a very long hill and burst into flame immediately upon reaching the summit. In view of these disasters, I have recently advised that the exhaust pipes should be placed outside the tray, or the under-cover, and so arranged that any escape of petrol from the carburettor or pipes will be conducted direct to the roadway, and not be allowed to collect in the tray. In many instances a large amount of lubricating oil is also allowed to collect within the trays, which, of course, as soon as any flame is produced by the ignition of petrol, only causes further increase of the fire. It is obvious that the surplus oil should never be allowed to collect."

Some other Causes of Motor-Car Fires.

Since Mr. Critchley's note came to hand I have, curiously enough, received a copy of a circular issued by an American insurance company giving a list of causes of motor-car fires which have, since they took up the motor insurance business, come under their notice. Pressure of space precludes the reproduction of the complete list, but I have picked out three cases just to show how serious results may arise from simple causes:—Lighted cigar laid on a car and forgotten caused bad fire.—Spontaneous combustion of waste and rags used in cleaning and painting caused a fire at a garage resulting in serious damage.—Chauffeur struck a match to light lamps while petrol tank was being filled. The explosion and subsequent fire resulted in the destruction of the car. Needless to say quite a number of cases are cited where fires have resulted owing to leaking petrol being ignited by carelessly thrown down matches and cigarette ends, thus again emphasizing the fact that too much care cannot be taken in seeing that the connections between the petrol tank and the carburettor are maintained in a perfectly tight condition.

ARCANUM.

THE cars of members of the Motor Union attending the forthcoming meeting at Bournemouth will be accommodated free of charge at the Imperial Motor Works, Holdenhurst Road, Bournemouth.

THE first motor-car visiting the Isle of Man this year was registered at the Highway Board's office at Douglas on the 1st inst.

IN the death of Sir F. S. Philipson-Stow the A.C.U. has lost a great supporter, for it was on his Fernhurst estate that their most successful hill climbs have been held.

MOTORISTS attending the Franco-British Exhibition at Shepherd's Bush will be interested to learn that there is a motor garage at the Notting Hill Gate end of Church Street, Kensington. This is owned by Mr. G. H. Stanley Rawdon.

THE Rev. Dr. Darlington, of St. Mark's Vicarage, Kennington Oval, London, S.E., the president of the Tramways Brotherhood, has been conducting a motor-car mission to the tramway men at Northampton and other places in that district.

THE latest complaint against the motor-car in France comes from the makers of billiard tables and owners of billiard saloons. The game has considerably declined in popularity in recent years, which, according to these authorities, is ascribable to the popularity of motoring.

THE number of motor-cars registered in the county of Surrey from January 1st to March 31st was ninety-two, the number of motor-cycles forty-six, and the number of drivers licensed 1,420, the total receipts for the quarter under the Motor Car Act amounting to £499 18s.

WE learn that Messrs. J. Keele and Co. have been appointed the London wholesale and retail agents for the well-known Weigel cars, and that they have the latest models on view in their show rooms at 72, Bond Street, W., where the cars can be seen, and arrangements made for trial runs.

IN giving a verdict of "Accidental death," at an inquiry at Wimbledon, into the circumstances attending the death of a little girl who was knocked down and killed by a motor-car, the jury added that they were of opinion that a speed limit should be imposed throughout the principal thoroughfares of the town.

THE term of holdship of the Hereford Trophy having expired, Messrs. Clement-Talbot, Ltd., inform us they have now returned the same to the Hereford Automobile Club, in whose charge it will remain until it is competed for again. This trophy was won on the Earl of Shrewsbury's 12-16-h.p. Talbot at last year's Frome's Hill Climb.

THE Gloucestershire Historical Pageant will take place at Cheltenham from July 6th to 11th, and doubtless a number of motor-cars will convey spectators to what promises to be a unique event in the history of modern pageantry. Messrs. Norton and Co., of 1-6, Bath Road, Cheltenham, have an excellent garage, which will be of considerable service to motoring visitors.

THE Maudslay Motor Company, Ltd., Coventry, have recently secured several orders for industrial vehicles, one of which is a two-ton lorry for Messrs. Lucas and Co., Ltd., the Brewery, Leamington; whilst another is for use as an estate cart at the Earl of Wimborne's place, Canford Manor. The company also have an order in hand for a private omnibus for the Huntercombe Golf Club, Nettlebed.

THE programme of the Inter-Club meet of members of the Motor Union to be held to-day (Saturday) at Bournemouth includes an assembly of the cars at the Pier entrance at 3 p.m. The New Forest Automobile Club and Hampshire Motor Union are inviting motoring visitors to tea in the winter gardens at 4.30 p.m., and the tenth provincial dinner of the Motor Union will be held at 7 for 7.15 p.m. at the Hotel Mont Dore.

EARLY the other morning a derelict motor-car was taken to Hounslow and left in charge of the police. Subsequent inquiries disclosed that the car was the property of the Hon. Ivor Guest, and had been taken out by the driver, who was accompanied by two friends. While proceeding along the Bath road a collision occurred, in which the car was damaged and a horse much injured. The chauffeur is reported to have abandoned the car and to have failed to have subsequently appeared before his employer.

HERE AND THERE.

TWENTY candidates for the R.A.C. driving certificate have been examined at the Naval Motor School, Twyford Avenue, Stamsshaw, Portsmouth.

AMONGST recent purchasers of Weigel 40-h.p. cars are:—

Colonel Mainwaring, Mr. David Davis (the well-known counsel, of Birmingham), and Sir Hugo de Bathe.

AT the August meeting, at Brooklands, a match will be run between Mr. S. F. Edge, driving a Napier car, and Mr. Charles Jarrott, driving either a De Dietrich or a Mors car.

THE East Sussex County Council has authorised the county surveyor to report generally upon the erection of special motor danger signs throughout the area of their jurisdiction.

THE Corporation of Edinburgh is inviting tenders, to be received not later than Wednesday next, for the supply of a 16-20-h.p. four-cylinder motor chassis with Palmer tyres.

MESSRS. A. AND F. NORTHCOTE, of the Royal Mews and Motor Garage, Bear Street, Barnstaple, who last year established a motor service which has proved popular, have just made two important additions to their stud of cars.

The Hornsby Chain Track Motor Vehicles.

The upper illustration depicts the Hornsby 35-h.p. petrol chain track car, with the inventor, Mr. D. Roberts, M.I.Mech.E., standing at the side. The two lower illustrations show a 35-h.p. heavy oil tractor passing over soft sand.

THE Committee that is responsible for the public parks in the Metropolis is making a recommendation to the L.C.C. to purchase seven motor lawn mowers for use in the open spaces in London.

MR. C. B. KELLOW, of the Kellow Motor Company, Melbourne, Victoria, is at present on a visit to this country to investigate the commercial motor vehicle with a view to introducing into Australia machines which are most suited to existing local conditions.

THE exports of motor-cars and parts from the United States during March last attained a value of only £107,877, as compared with £109,075 in the corresponding month of 1907. The United Kingdom heads the list, being responsible for £31,364 of the total, Canada taking the second place with £27,189.

AT a meeting of the Farnham Board of Guardians it was reported that the widow of John Bryan, who died from injuries sustained through being knocked down by a motor-car on the Ripley road on April 25th, had been compelled to enter the workhouse, and it was suggested that the case against the owner of the car should be watched on behalf of the Guardians with a view to compensation being obtained for the widow.

A MOTOR-BUS is now running between Leamington and Stratford-on-Avon.

EARL BEAUCHAMP has acquired an electromobile for town use from the Electromobile Company.

SIR ALFRED FRIPP, Surgeon-in-Ordinary to His Majesty the King, has lately acquired a 15-20-h.p. Fiat landaulet.

THE Hove Council has extended the licence of the Brighton, Hove and Preston United Omnibus Company, Ltd., to store 500 gallons of petrol.

SPECIFICATIONS have been issued by the U.S. War Department of a motor supply wagon required for the use of the signal corps of the United States Army.

EARL FITZWILLIAM considers that no place in the North of England with which he is acquainted has so much traffic in the same small area of street as the town of Retford.

THE imports of motor-cars and parts into the United States during March last only attained a value of £23,888 as compared with £68,934 in the corresponding month of 1907.

ACCORDING to the clerk of the Torrington (Devon) Rural Council every motor lorry and heavy hauling engine working regularly within the area of the Council's operations costs that body £150 per year in consequence of alleged damage to the roads.

A USEFUL accessory in the form of a tripod lampholder, designed to hold an oil lamp while the driver may be making a repair about the motor, has lately been introduced by the Beloit Supply Company, of Beloit, Wis., U.S.A. The tripod consists of

the usual spreading feet, together with a stand on which the lamp rests, and a swinging arm is inserted into the socket used for supporting the lamp on the dash. When not in use the tripod can be folded most compactly and carried in an ordinary tool box.

At the meeting of the Sleaford Rural Council it was stated, on behalf of the Blankney, Linwood, and Martin Commissioners, that, owing to the enormously increased motor traffic from Lincoln to Woodhall Spa, the Commissioners found it necessary to rebuild a bridge over the river near Kirkstead.

ONE of the most ardent motorists at present in London is Signor Bonci, the great tenor, who is engaged at the Royal Opera. At his home in Italy he possesses a particularly fine car, in which he delights to explore the country. Another operatic motorist who has made an enviable name for himself at Covent Garden is Signor Zenatello, who attributes his good health partly to his love of fresh air.

IN the early part of last week the premises of Messrs. Halleys, Ltd., at Manchester, were broken into, the attraction for the burglars being five gold and one silver medals (awarded to the Swift cars in various years for reliability), which had been lent by the Swift Motor Company, Ltd., to their Manchester agents for exhibition. The burglars smashed the frame and carried off what they evidently thought to be solid gold trophies, but it is gratifying to know that the real medals are still resting securely in the strong room of the owners, the burglars' "haul" consisting of hollow brass electrotypes worth fifteen pence apiece.

MOTOR-CARS are announced to run to Aymchurch and New Romney.

MESSRS. J. ASH AND SONS, of Alfred Street, Nottingham, are doing considerable business in bodies for motor-cars.

THE "Skimabout" is the name given to a new motor-car which has just been put on the market in the United States.

HIS Excellency General Grant, Governor of Malta, has purchased from the Daimler Company a 42-h.p. Aston landaulet.

THE Battersea Borough Council has decided to apply to the L.G.B. for a speed limit for motor vehicles in certain thoroughfares in the borough.

A LARGE catch of herrings off the Co. Down coast the other night were immediately transferred by a 20-h.p. Argyll motor lorry to Belfast, and were retailed at St. George's Market the next morning.

ANSWERING Mr. Cathcart Wason in the House of Commons, Mr. John Burns has expressed a doubt as to whether it would be practicable to adopt a maximum speed of twelve miles an hour for all vehicles in London.

EFFORTS are being made by the Brighton owners of horse-cabs to restrict the number of licences issued, and especially to prevent persons who have transferred their licences to taxi-cabs from obtaining fresh permits.

PROMPTED by their adjacency to the Franco-British Exhibition, the conductors of the National Motor Academy have arranged garage for a hundred cars on their private instruction track at Boundary Road, Notting Hill, W., near the Exhibition.

AMONG the orders recently secured by Messrs. Durham, Churchill and Co., Sheffield, are a 24-30-h.p. three-ton chassis for the Bradford Corporation, and a 40-h.p. char-a-banc, with seating capacity for twenty-two persons, complete with canopy, for Mr. D. E. Davies, of Barmouth.

THE bursting of a tyre on the King's motor-car delayed His Majesty at Stevenage on Tuesday *en route* for Newmarket. Half an hour elapsed before the journey could be resumed. His Majesty left the car and strolled about, taking a keen interest in the picturesque church of Holy Trinity close by. By the time the car was ready to restart several hundred persons had assembled, and gave His Majesty a hearty send-off.

WE regret to hear of the death of the Hon. Mr. Hungerford Tutor Boddam, who died suddenly a few days ago in a train while travelling from Madras to Bombay, *en route* to England, on his retirement from the Bench as a judge of the Madras High Court. Mr. Boddam was travelling with the Chief Justice of Madras, Sir Arnold White, and Sir Ralph Benson. During the time Mr. Boddam was in Madras he became extremely popular with all classes. Especially will he be missed by the Mohammedan community, whose welfare he had at heart, and whose cause he had warmly espoused ever since his arrival in India. He was President of the Anjuman and other kindred Mohammedan institutions, and at the late Mohammedan conference of all India, held in Madras, the Governor, Sir Arthur Lawley, acknowledged his services. Mr. Boddam was also president of the Motor Union of Southern India.

VISITORS to London are often at a loss to know how to spend Sunday. They have "done" the sights during the week, and the majority decide to go with their City brethren away into the adjoining country or down to the seaside. The habitual week-ender will heartily welcome the latest innovation of the Daimler Company, who are arranging trips to Brighton every Sunday during the coming season. The cars used will be of the standard 42-h.p. type, and the driver will be in a smart uniform. The start will be made each Sunday as follows:—The Hotel Waldorf at 10 a.m., Savoy at 10.5 a.m., Cecil at 10.15 a.m., Grand at 10.25 a.m., Metropole at 10.30 a.m., Victoria at 10.35 a.m., and the Grosvenor at 10.45 a.m., arriving at Brighton in time for lunch. On the return journey the car will start from Brighton at 5 p.m., reaching London in time for dinner. The fares are very moderate, viz., 12s. 6d. single journey, and 15s. return, and the seat by the driver 2s. 6d. extra each way. There is no doubt that the reputation of the Daimler car, coupled with the very moderate charges, will appeal to many, and make these trips very popular during the summer months.

MOTORING ACCESSORIES.

The new Stepney Flange.

The Stepney Wheel Company are putting on the market a new invention under the above name with the object of facilitating the fitting of the Stepney Spare Wheel. Hitherto it has been necessary to push the outer covers inwards in order to fix the hooks of the Stepney wheel to the rim of the damaged car wheel. To obviate this the flange, illustrated in Figs. 1, 2 and 3, has been introduced. As will be seen, it consists of a ring, which, by means of bolts and nuts, is fixed through the

Fig. 1.—The new Flange which, when fitted permanently to motor-car wheels, enables the Stepney Spare Wheel to be quickly and easily attached.

felloe, improving the appearance of the artillery car wheels and at the same time considerably strengthening them.

Although the new flange enables the Stepney wheel to be fitted in much less time and with less trouble, it has primarily been designed with the view of extending the utility of the Stepney by rendering it an "anti-skid," therefore serving the double purpose. With the introduction of the new flange it will not be necessary to have a steel studded tyre permanently fitted to the car wheel, but the spare one can be fitted with a steel studded tyre, and when the necessity of a non-skid arises the Stepney Non-Skid Spare Wheel can be placed in position in a few seconds, by means of the new flange, to one of the driving wheels. The company look upon this new feature of the Stepney as being likely, when its use is generally adopted, to remove a good deal of opposition

Fig. 2.—Sectional View of Wheel fitted with Flange.

Fig. 3.—Sectional View of Wheel with new Flange and Stepney Non-Skid Spare Wheel.

at present existing to motoring on account of the studded tyres, as it is obvious the car will be running on plain tyres in dry weather and in this way the minimum wear of the road surface will follow. We may mention that when the Stepney wheel is to be fitted as a non-skid it is not necessary to jack up the car or deflate the car tyre.

The new flanges are very light and have been exhaustively tested, and in putting them on the market the company have every confidence that their adoption by motorists generally is only a question of time. In this belief they have taken show rooms in London at 168, Great Portland

Street, W., where the flange will be on view, and a responsible official in charge to demonstrate its advantages and to fit them to the car wheels of motorists adopting them.

Pullman's Non-skid.

We recently referred to the salient features of the "Detachable 1908" non-skid, introduced by Messrs. R. and J. Pullman, Ltd., of the Westbrook Mills, Godalming. The registered clip, which has been brought out to assist the operation of fitting and removing, is shown on the right hand side of Fig. 4. Those who intend to adopt this speciality

Fig. 4.

should take care when sending the circumference of the cover to state whether the measurement was taken when the tyre was deflated or inflated. The outside measurement from bead to bead should also be given.

The Star Weather Screen.

Fig. 5 depicts the patent weather screen which has just been placed on the market by the Star Engineering Company, Wolverhampton. The screen is composed of a sheet of flexible waterproof canvas that is wound round a spring roller, the axis of which is carried by the dashboard; the free edge of the sheet is stiffened by a suitable bar, which is connected with the dashboard through the medium of a pair of jointed bars, each of which is formed in two lengths pivotally connected together by means of a joint of the knife-blade type which allows the two lengths to be substantially closed together in one direction but prevents them from being moved more than slightly out of line with one another in the opposite direction. The portions of each bar are also provided with joints either at their connection with the main support or with the stiffening bar, which limits their turning movement either way, so that when the bars

Fig. 5.

have been opened out to hold the stiffening bar in its upward position with the sheet drawn upward from the roller the bars cannot move sideways and allow the stiffening bar to fall. When the bars have been opened for the purpose of holding up the stiffening bar of the sheet against the pull of the roller spring they are stopped from further movement in the same direction by the stop joint between the two lengths of which they are composed; at the same time the two lengths of each bar have moved sufficiently out of line with the other to ensure that they cannot accidentally turn backwards in relation to one another.

Correspondence.

[Letters to the Editor should be addressed to the offices. 27-33, Charing Cross Road, London, W.C.]

GEAR-BOX LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Sufficient attention is not given to the question of gear-box lubrication. Mostly the gear-box is filled nearly to the top with thick grease, and the motorist is satisfied so long as the grease does not run out, and the gears are not noisy. Such filling of the box means a great absorption of power, as can be shown in many ways. For instance, take the temperature of a box which has run with a little fairly heavy oil in the bottom (just enough to splash up all over the inside of the box is all that is necessary) and then take out the oil and fill the box with grease. Run the same distance and again take the temperature—the increase in heat is most astonishing. Indeed, the boxes frequently become so hot that they cannot be touched with the hand. Or again, with clutch out, and gear in neutral, turn the gears by hand—with the little oil they run easily, and continue to run after the hand is removed, but with the grease it is a labour to turn them at all, and they stick in the lubricant as soon as the motive power is taken away. Also a distinct difference is found in the car when coasting, and this brings home the effect that such useless absorption of power must have on efficiency.

Further, a grease will keep grit, pieces of metal off the gears, &c., in suspension, and these particles are continually getting between the teeth, and by their presence adding to their number. On the other hand, with an oil, on emptying the gear-box, you will find the solid particles collected in the bottom of the box. If using a little oil in the gear-box is

shaped as to catch in front of the heel of the boot, and extend to within two or three inches of the toe, while another good arrangement is that on the Leon Bollée car, where the pedals are made half round and fairly wide, so that the sole of the foot may rest upon them.—Yours truly,

HERBERT J. CHAPMAN.

SUNDAY MOTORING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your last issue you refer to the attack of a reverend gentleman on those motorists who take advantage of the Sunday to use their motor-cars and see a little more of their native land than would otherwise be possible. The Lincolnshire Motor Cycle Club have, in this connection, been discussing a suggestion which should appeal to those who try to harmonise the motor with the Sabbath.

They have suggested that motor-cyclists of the city of Lincoln and of other places where they have centres should meet for the purpose of attending Sunday morning service at the churches of those clergymen who are members of the club. This association has set its face against Sunday meets, but to ride out on a pleasant Sunday morning to some church such as that at Gayton and join in a service conducted by a fellow-member of the club, and then take lunch together at a popular resort, should prove beneficial to all members and a means of keeping together without offending the susceptibilities of those who prefer to walk rather

Three of the Berna Motor-Lorries used by Messrs. Ind, Coope and Co., Ltd., Romford.

found to be noisy, it can be remedied by covering with felt or some such sound-absorbing medium.—Yours truly,

A. DUCKHAM.

THE POSITION OF PEDALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In furtherance of the discussion *re* the pedals on cars, I should say that the use of these becomes as second nature to the driver of a car in the course of a few hours; and I cannot see that the position of the pedals is conducive to the safety of the public, as Mr. L. Hull says, nor that even a (careful) driver in a tight corner would jam down his brake pedal at all. He should use side brakes judiciously, but with confidence, although I must say some hand brakes call for an acrobatic performance on the part of a driver before they can be brought into action. One of the nicest arrangements is that adopted on the Fiat and Humber cars with their familiar little accelerator buttons practically between the pedals but nearer the seat, so that one's foot rests upon it naturally and seems to glide automatically to the footbrake when desired; but, after all, it is only a matter of fancy. Darracq, Panhard and others fit a neat little accelerator pedal on the extreme right, while, of course, many cars have none at all. I once had a 40-h.p. Napier which had both clutch and brake pedals on the left side of the steering column, and that was very awkward and tricky to drive until one got used to it.

I certainly do not like the clutch pedal to be on the right, and there are a good many of these; neither do I think that to have the clutch connected to the brake is good practice. A good many pedals are not half large enough, they should be about three inches wide, and be so

than ride on this one day of the week. I do not know whether the idea could be applied to those who own motor-cars, but, as a Lincolnshire motorist, I feel there is no reason why it should not be possible, especially as one of our popular canons at the Cathedral is himself an enthusiastic motorist.—Yours truly,

TOM OF LINCOLN.

EVIDENCE IN MOTOR-CAR CASES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am not a lawyer, but, notwithstanding, it has always struck me as an extraordinary thing that magistrates permit evidence to be brought forward in motor-car cases of things and acts which take place when the defendant is not present, and thereby place him in an absolutely impossible position to deny, repudiate or accept such evidence.

I have always understood that in English courts of justice no evidence would be permitted as to what took place between two persons when the party accused or the party in litigation was not present. This, however, is exactly what is taking place in all motor-car prosecutions.

The police constable swears that he started his watch at a given signal and stopped it at no given signal, and then evidence is brought forward by another constable to say that he saw the first man do it.

What this has to do with the facts of the case I fail to understand. The case is not whether the police-constable pressed the button or not; the real case is against a certain person who knows nothing at all about the starting or the stopping of the watch. He was not present when the watch was started or stopped, and is, therefore, put into the position of being unable either to agree with the constables or disagree. As Mr. Plowden rightly stated, he fails to comprehend how any motorist can get

out of the charge, and he had the greatest sympathy for anybody caught in a trap owing to this.

If any of your readers can point out to me cases where similar evidence is admitted, I think it will be interesting, and I equally think it will be interesting if a case on these lines were fought. In the meantime I have addressed a letter, of which the enclosed is a copy, to the Home Secretary.—Yours truly,

D. M. WEIGEL.

[COPY.]

The Home Secretary,
Whitehall, S. W.

May 14th, 1908.

Dear Sir,—Might I call your attention to the evidence which has always been admitted when persons are charged with exceeding the speed limit under the Motor Car Act?

Evidence is tendered by constables that they pressed a watch at a certain time and stopped it at a certain time, and this evidence is corroborated by some other constable.

Might I submit to you, sir, that evidence which is given of acts which are done when the defendant was not present and was, therefore, absolutely unable to deny or acknowledge, is contrary to all practice in British courts?

The prosecution of motorists for exceeding the speed limit becomes a farce, inasmuch as, if such evidence as this is admitted, they are convicted upon a statement and not upon the evidence of fact.

Evidence which is tendered as to what took place when the defendant was not present, I submit to you, sir, is inadmissible evidence. Apart from this, it places the power in the hands of the prosecutor, which is contrary to the interests of justice, and which permits of a possible gross abuse.

As I think, sir, that motorists are entitled to the same justice and the same method of administering it as other people, I put this matter before you for your kind consideration.—Faithfully yours,

(Signed) D. M. WEIGEL.

AN INJUSTICE TO GARAGE OWNERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We should like to draw attention to a certain class of motorists who, when hung up on the road, send a messenger to the nearest garage, or one recommended, for assistance. Now, during the time that help is arriving they manage to find out and rectify the trouble themselves; they then drive away, never waiting for the assistance that has been sent to them, or troubling to call at the garage and thanking them for their trouble.

We may state that we have been served this way a considerable number of times. On May 9th last a powerful racing car, evidently on its way to Brooklands, got hung up, and we were sent for to tow it along. We telephoned to our other depot for a car to go and tow them, and at the same time gave one of the persons who was with the vehicle a tow rope and asked him to go back and meet the car sent to his assistance. A few minutes afterwards the racer was started up, and the persons jumped up and drove straight away, at the same time taking our tow rope with them, never troubling to call and thank us for the trouble we had been put to, although the car sent to their assistance was searching the highways for them.—Yours truly,

LETZER AND JORDAN.

SELF-STARTING DEVICES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—What has become of the many self-starting devices of which so much was heard about the time of the last Paris show? One hears so little of them at the present time that one is not unfairly inclined to imagine that they have been tried and found wanting. This is a great pity, for undoubtedly there is a market for such a device, and the maker who brings out a really practical self-starter should meet with a full reward.—Yours truly,

T. R. BURGESS.

SOME FACTS IN THE SELECTION OF MOTOR OILS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Who will believe? not I, for in deceiving
Lies the dear charm of life's delightful dream;
I cannot spare the luxury of believing
That all things beautiful are what they “seem.”

Such thoughts come into one's mind when the now daily offers of cheap and reputed excellent lubricating oils come to hand. Few motorists pass a day without receiving some advertisement of a motor oil. Some are most enticing, price so low and quality so good, anyway according to the printed matter that nearly every post brings. The danger of employing a bad oil is great, but the chance of getting a good cheap oil is most inviting. So it has struck me that the automobilist might like just a few tests, so that he can test for himself the many kinds that are offered.

If a chemical balance is at hand, a good test is to weigh a gramme of the oil in a Berlin porcelain dish, then place the dish with the oil in

it in an ordinary kitchen oven and keep it there for about four hours; the temperature in such an oven is about 300 deg. Fahr., which is enough for a rough and ready test. Then re-weigh; if there is more than a 2 per cent. loss, do not buy the oil, even if it be offered for nothing. The oil too, after four hours in the oven, should merely feel “tacky,” that is, like treacle. Another excellent and simple test is to get a drop tube, the point of which is one millimetre in diameter, heat some of the oil to be examined to 200 deg. Fahr., fill the improvised pipette with it, and note the time it takes to run out; carry out a similar test with a standard reliable oil; if the oil under test varies more than 20 sec. either way, at the same temperature, it should be discarded.

The flash test is probably the one most to be depended upon. An oil that gives a flash at anything between 380 and 500 Fahrenheit is fair, and the nearer 500 deg. the better. This test can also be carried out by a layman without much trouble. The apparatus needed is but a spirit lamp or Bunsen burner, a porcelain dish, a thermometer, and a taper, and either a tripod or some form of retort stand; the ordinary drawing-room kettle stand will answer. The oil is put in the dish over the lamp and the thermometer is placed in the oil and is used to stir the latter up. When it shows 250 Fahr. apply a lighted taper to the surface of the oil, and go on doing so as the temperature rises, until there is a faint blue vapour on the surface that catches light or flashes; note reading of the thermometer when this occurs, and that is the “flash point.” If it is near 500 Fahr. the oil will do for petrol engines.

These tests are, as I have already stated, merely rough and ready ones, but I am sure if the specimen answers to the three given the oil may be used with perfect safety.—Yours truly,

C. T. W. H.

The 60-h.p. Six-Cylinder Weigel Car recently supplied to the Right Hon. Earl of Wiltshire by the London and Parisian Motor Company. The car is entirely British made, the chassis being manufactured by Weigel Motors, Ltd., and the limousine body is by Messrs. J. Rothschild et fils, of Westminster.

WET DRIVING SEATS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—If your correspondents “Arcanum” and “Old Hand” will try a leather or mackintosh rug, fastened round the waist by a piece of elastic and a catch, so as to bring the overlap of the rug well to one side, or the front, and over this put on the ordinary motorist's mackintosh coat, with the back seam unslit, pulling it well under him as he sits down, so that both mackintosh and rug are between him and the cushion, he will find he can keep dry for many hours in heavy rain. I get these rugs from Messrs. Gamage, but no doubt any motor shop supplies similar ones. The rug must be short enough to leave the feet clear for driving.—Yours truly,

H. E. R.

CONNECTING UP ACCUMULATORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to “Novice's” inquiry on the above subject in the last issue of the *M.C.J.*, there is no reason I know of why the battery connections should always be the same in order to obtain satisfactory ignition service. The authority in question is quite correct with regard to the depositing action of the contact on the tremblers of the coil. The action is exactly the same as that of the ordinary arc lamp, which, when trimmed, is supplied with a negative carbon but half the length of the positive. At the end of its usual period of burning there is scarcely anything left of the positive carbon, while the negative has hardly decreased in size at all. Personally, I make a practice of occasionally reversing the wire connections to the accumulators.—Yours truly,

W. SIMPSON.

PETROL AND PETROL TESTS.*

By G. H. BAILLIE.

It is easy enough to formulate what a good fuel should be.

1. It should enable the engine to start easily from cold.
2. It should not smell too bad before or after combustion.
3. It should run the car as many miles as possible to the shilling.
4. It should not lead to deposits in the cylinder or on the valves under any of the various conditions of running.

Conditions 3 and 4 are not easy to test. One may find that a new fuel does not run the car as many miles as does its accustomed fuel, but it does not follow in the least that the new fuel is not so good. Its specific gravity may be different weight of float. Its specific gravity may be greater, and require, therefore, a larger jet to give sufficient fuel. It may take a larger amount of air for combustion, and need, therefore, a change in the carburettor inlets. Finally, it may be less volatile, and may not be fully evaporated and utilised. It is, in fact, impossible to judge of the value of a new fuel by running a car on it without taking a great deal of trouble to be sure that the fuel is given a fair chance.

The number of miles to be got out of a shilling's worth of fuel depends on three things. First, the price per gallon; secondly, the calorific value per gallon; thirdly, the extent to which the fuel is utilised. There are several known methods of testing the calorific value, but it is seldom necessary to carry out the test. The calorific value of most common hydrocarbons is known, and in dealing with the hydrocarbons of a particular series their calorific values per pound differ only very little, generally diminishing slightly as the specific gravity increases. In the paraffin series, of which the American petrols are almost entirely composed, there is a difference of only 1 per cent. in the calorific value per pound between the highest and lowest members present in any quantity in petrol. The calorific value per gallon is, however, the interesting factor, and this can be obtained from the value per pound and the specific gravity. In any particular series it increases with the specific gravity, but not very much.

In fact, if the nature or source of the fuel is known, I think the calorific value could always be estimated to within 5 per cent., without knowing the exact composition of the fuel, and as regards petrols, I do not think the calorific value per gallon of any petrol will be 5 per cent. different from, say, Pratt's.

The ideal fuel would all vaporise in its passage along the induction pipe from jet to inlet valve. Probably no fuel does it. In an engine running at 600 r.p.m. the time of transit from jet to inlet valve is of the order of $\frac{1}{100}$ of a second, depending, of course, on the diameter and length of the inlet pipe, while the whole time available before the compression stroke begins is $\frac{1}{60}$ of a second.

Seven pure fuels are: pentane, hexane, heptane, benzene, octane, nonane, and absolute or ethyl alcohol. Hexane and heptane are the chief constituents of petrol, and octane enters also to a greater or less extent into every petrol. The American petrols consist almost entirely of members of the paraffin or saturated series of hydro-carbons. Table I. gives the properties of the earlier members of this series:—

TABLE I.—Properties of the principal constituents of fuels.

| | Formula. | Density at 15 deg. C. | Boiling point. | Lower calorific value per litre. |
|-------------------------|----------------|-----------------------|----------------|----------------------------------|
| Butane | C_4H_{10} | ·600 | 1 | — |
| Pentane, iso- | C_5H_{12} | ·628 | 31 | — |
| Pentane, normal | C_5H_{12} | ·626 | 36 | — |
| Hexane | C_6H_{14} | ·674 | 68·5 | 7155 |
| Hexahydrobenzene | C_6H_{12} | ·760 | 69 | — |
| Hexahydrotoluene | C_7H_{12} | ·772 | 97 | — |
| Heptane | C_7H_{16} | ·688 | 98 | 7380 |
| Octane | C_8H_{18} | ·719 | 120 | 7560 |
| Octane, normal | C_8H_{18} | ·707 | 125 | — |
| Nonane, <i>n</i> | C_9H_{20} | ·740 | 136 | 7900 |
| Nonane, normal | C_9H_{20} | ·722 | 150 | — |
| Decane | $C_{10}H_{22}$ | ·738 | 160 | 8060 |
| | | | | |
| Benzene | C_6H_6 | ·884 | 80·4 | 9800 |
| Toluene | C_7H_8 | ·871 | 111·0 | — |
| | | | | |
| Ethyl alcohol | C_2H_6 | ·794 | 78·3 | 5270 |
| Methyl alcohol | $C H_4$ | ·797 | 66·0 | — |

The petrol hydrocarbons are arranged in the order of their boiling points, and it may be noted that the densities and boiling points increase together only in one and the same series. Of the two naphthenes given, which are found in Eastern petroleum, hexahydrobenzene has the same boiling point as hexane, but a density of ·760 instead of ·674, and hexahydrotoluene, with the same boiling point as heptane, has

* From a paper read before the Royal Automobile Club on the 14th inst.

a density of ·772, while that of heptane is ·688. The density therefore forms no ground on which to condemn a fuel. Industrial alcohol is composed of 90 per cent. of ethyl alcohol (with some water) and 10 per cent. of methyl alcohol or wood spirit.

Hexene would form an ideal fuel. Its boiling point of 68·5 is high enough to prevent boiling in the carburettor, and it vaporises very quickly at the ordinary temperature of the air. Its price, however, is about that of eighteenth-century cognac. Heptane has a boiling point about that of water, and is readily vaporised in the ordinary running of a motor, but at starting there might be difficulty in cold weather, and it probably yields some deposit in the cylinders while the engine is cold.

Every petrol that I have tested contains pentane and octane besides hexane and heptane, and most contain butane, nonane, and decane. One actually contained twelve members of the series, down to pentadecane. Butane, boiling at 1 deg., is really a gas, and is contained in petrol in a dissolved state. It comes off as gas under the slightest provocation, and a petrol is certainly better without it. The presence, in appreciable quantity, of any member heavier than heptane leads to deposits in a cold engine or when conditions are not quite right.

I might here call attention to the confusion that often arises between "benzene" and "benzine." Benzene is a definite hydro-carbon, with formula C_6H_6 , and is a coal-tar product. Benzine is a popular name for a certain class of spirit distilled from petroleum, and both names are frequently used for benzol or a mixture of benzene and other coal-tar spirits. The benzol of the South Metropolitan Gas Company has approximately the boiling point of benzene for about three-quarters of its volume, and then the boiling point rises to that of toluene, viz., 111 deg.

As it has been found that the best results are obtained in an engine when the mixture contains about 30 per cent. more air than the quantity theoretically sufficient to completely burn the fuel, I have worked out the results for four mixtures—that containing the right

The 40-60-h.p. Gobron-Brillie Car recently delivered to Major H. Stuart Murray, of New Milton.

The vehicle, which was supplied by Mr. Wm. Vincent, of Reading, is fitted with a very roomy and original type of body of Mr. Vincent's construction. It is built to seat seven persons, with two folding seats facing forward in the back, pull-out table, and screen behind driver's seat, which may be raised or lowered at will by means of a rack and pinion device. Attention may also be drawn to the neat way in which the Cape hood is folded back, giving a clear view of the road behind for reversing purposes, also to the special hood cover fitted, keeping the hood quite clean.

amount of air theoretically, and those with 20 per cent. less, 20 per cent. more, and 40 per cent. more air. The figures are given in Table II.

TABLE II.—Minimum Temperature at which Fuel can Exist as Vapour.

| | 20 | | 20 | | 40 | |
|----------------------|------------|------------|------------|------------|------------|--|
| Air. | per cent. | Right | per cent. | per cent. | per cent. | |
| | less. | amount. | more. | more. | more. | |
| Hexane | - 14·2 ... | - 17·7 ... | - 20·6 ... | - 24·2 ... | - 24·2 ... | |
| Heptane | 7·3 ... | 3·6 ... | 0·7 ... | 2·0 ... | 2·0 ... | |
| Octane | 22·9 ... | 19·0 ... | 16·0 ... | 13·0 ... | 13·0 ... | |
| Decane | 46·1 ... | 42·0 ... | 39·0 ... | 36·5 ... | 36·5 ... | |
| Benzene | - 0·7 ... | - 4·3 ... | - 6·9 ... | - 8·3 ... | - 8·3 ... | |
| Ethyl alcohol | 26·5 ... | 23·3 ... | 20·7 ... | 17·8 ... | 17·8 ... | |

From this it appears that octane, decane and alcohol cannot exist as vapour under ordinary atmospheric conditions except in very weak mixtures. The large difference between benzene and alcohol accounts for some of the difficulty in using the latter as compared with the former in an engine.

But if these fuels were mixed with the air in the form of liquid at these temperatures they would not vaporise completely, for in evaporating they reduce the temperature. The fall in temperature due to evaporation can be calculated from the latent heats of the fuel and the specific heat of the air. Table III. gives the drop in temperature for the same fuels.

Table III.—Drop in Temperature due to Evaporation.

| | 20 | | 20 | | 40 | |
|---------------|-----------|---------|-----------|-----------|-----------|--|
| Air. | per cent. | Right | per cent. | per cent. | per cent. | |
| | less. | amount. | more. | more. | more. | |
| Hexane | 23·3 | 19·0 | 16·3 | 14·2 | 14·2 | |
| Heptane | 22·4 | 17·9 | 15·0 | 12·8 | 12·8 | |
| Octane | 21·5 | 17·2 | 14·3 | 12·3 | 12·3 | |
| Decane | 18·5 | 14·8 | 12·4 | 10·6 | 10·6 | |
| Benzene | 47·3 | 32·2 | 23·5 | 20·9 | 20·9 | |
| Ethyl alcohol | 95·5 | 76·3 | 63·7 | 54·6 | 54·6 | |

Here, again, alcohol in evaporating lowers the temperature twice as much as benzene does. Benzene, too, which, according to Table II, can vaporise at about the same temperature as heptane, produces twice as big a drop in temperature as heptane does.

If the figures in Tables II. and III. be added together the result gives the minimum temperature which the air must have before the fuel is evaporated in order to completely evaporate it. Table IV. gives these temperatures.

TABLE IV.—Minimum Temperature of Air before Evaporation.

| Air. | 20 | | Right amount. | 20 | | 40 |
|-------------------|-----------------|-----|---------------|-----------------|-----|-----------------|
| | per cent. less. | | | per cent. more. | | per cent. more. |
| Hexane ... | 9.1 | ... | 1.3 | 4.3 | ... | 10.0 |
| Heptane ... | 29.7 | ... | 21.5 | 15.7 | ... | 10.8 |
| Octane ... | 44.4 | ... | 36.2 | 30.3 | ... | 25.3 |
| Decane ... | 64.6 | ... | 56.8 | 51.4 | ... | 47.1 |
| Benzene ... | 46.6 | ... | 27.9 | 16.6 | ... | 12.6 |
| Ethyl alcohol ... | 122.0 | ... | 99.6 | 84.4 | ... | 72.4 |

With the right amount of air none of the fuels except hexane can be evaporated completely in a cold engine, while alcohol requires the air to be at the boiling point of water for complete evaporation. With 20 per cent. more air, heptane and benzene can be vaporised cold. It may be noted that the temperature required for benzene falls very rapidly as the mixture becomes weaker.

Another factor, however, enters into the question, and that is the rate of the evaporation. The effect of the time required for evaporation can be estimated only by calculating from this expression the different temperatures which will cause the fuels to evaporate in the same time, and by arbitrarily assuming for one fuel, say, hexane, that a certain increase of temperature above the minimum is required to evaporate is sufficiently fast. I have, therefore, assumed that for hexane in a theoretically correct mixture the air should be at the normal temperature of 15 deg. Cent.—that is, the 13.7 deg. must be added to the minimum temperature to evaporate the fuel quickly enough. On this basis I have calculated the additional temperatures to be added in the case of the other fuels to produce evaporation in the same time. Table V. gives these temperatures added to those of Table IV.

TABLE V.—Temperatures before Evaporation to cause Evaporation in the same time for each fuel.

| Air. | 20 | | Right amount. | 20 | | 40 |
|-------------------|-----------------|-----|---------------|-----------------|-----|-----------------|
| | per cent. less. | | | per cent. more. | | per cent. more. |
| Hexane ... | 26.8 | ... | 15 | 6.6 | ... | 2.8 |
| Heptane ... | 71.4 | ... | 58.4 | 48.7 | ... | 40.2 |
| Octane ... | 104.6 | ... | 91.4 | 81.0 | ... | 72.4 |
| Decane ... | 149.3 | ... | 136.0 | 126.4 | ... | 111.4 |
| Benzene ... | 81.0 | ... | 57.3 | 42.3 | ... | 34.4 |
| Ethyl alcohol ... | 181.9 | ... | 154.3 | 135.4 | ... | 120.3 |

Heptane and benzene can be used readily in engines, even starting from cold. But this temperature of 53 deg. required for evaporation shows that they do not fully evaporate till the mixture comes in contact with the hot gases in the cylinder. In actual petrols there is always hexane present to facilitate starting, and the fact that it is so often necessary to flood the carburettor to obtain an abnormal quantity of petrol also shows that the evaporation of the heptane is far from complete when there are no hot gases to give the requisite temperature. Anyone who has used a surface carburettor of the old motor-bicycle type knows what starting from cold on heptane is like; the "stale" petrol that these carburettors so often produced was simply petrol from which the lighter constituents had been evaporated off.

The benzols of commerce also have certain constituents lighter than benzene, though only in small quantity; but, apart from these, starting from cold is comparatively easy, because a much lower temperature is sufficient to give a weaker mixture, but one which will still fire readily. With benzene the temperature diminishes more rapidly as the mixture becomes weaker than it does with heptane, and benzene has the further advantage over heptane that a mixture with 100 per cent. more than the right amount of air is combustible, while heptane is not combustible with more than 75 per cent. more air.

AUTOMOBILE ACCIDENTS.

A SERIOUS motor accident occurred near Brighton shortly after midnight on Saturday. The coastguard at Black Rock, Brighton, was cycling on the main road between Black Rock and Roedean when a motor-car, going towards Brighton, collided with him. He was hurled to the roadside, and his machine damaged.

The motor-car is said to have gone on, but after reaching the garage at Brighton, two of the occupants of the vehicle, who fancied they had hit something on the road, walked back. They reached the scene of the accident and did all that was possible, calling in the police and the doctor, who found the poor fellow suffering from broken ribs.

FROM Messrs. Turvey and Co., motor-car agents, Sunderland, come specimens of a novel picture post-card they have lately issued; it depicts a motor-car party that has been stopped by the police for travelling too speedily.

SMITH v. CORDINGLEY & CO.

IN the King's Bench Division, on Tuesday, before Mr. Justice Grantham and a special jury, the case of Smith v. Cordingley & Co. was down for hearing. This was an action for libel brought by Mr. Sidney Smith against Messrs. Cordingley & Co., proprietors of the *Motor-Car Journal*.

Mr. Duke, K.C., and Mr. H. A. McCardie appeared for the plaintiff, and Mr. Marshall Hall, K.C., and Mr. Grimwood Mears represented the defendants.

Mr. Duke, K.C., explained, in opening the case, that the defendants were the proprietors of the *Motor-Car Journal*, and complaint was made of a statement published in that paper on October 5th last. The defendants admitted the words complained of were libellous, but said they were published without malice and without gross negligence.

At this stage, Mr. Marshall Hall, K.C., consulted with Mr. Duke for a few minutes.

"My friend has just made a communication," said Mr. Duke, "which will very greatly shorten the matter." The learned counsel went on to state that he wished to make a public announcement. For a number of years the plaintiff had been engaged by Messrs. S. F. Edge and Co., and he had become an expert driver in motor competitions. In September last, in a race at Brooklands, in which motor-cars of 60-h.p. were racing for the first time, there was an unfortunate accident to Mr. Hermon, one of the competitors, who seemed to have lost control of his car, which travelled up a bank and turned over, Mr. Hermon being killed. About a fortnight or three weeks after that the defendants published a letter in their newspaper, in which blame was imputed to the plaintiff, who was the driver of one of the cars. That was an imputation under which the plaintiff could not rest, and he had not driven in any match since. Subsequently, the defendants published an apology for that statement, and he was sure that Mr. Marshall Hall would make it clear that the plaintiff was in no way to blame for the death of Mr. Hermon. The object the plaintiff desired would be attained if Mr. Hall would state that the charge was unfounded. It was written by a correspondent whom the plaintiff could not find, because he did not live, and never had lived, at the address on the letter.

Mr. Marshall Hall, K.C., said that whilst fully accepting the statement made by Mr. Duke, he desired to put before the Court the circumstances under which the letter containing the statements complained of was published. He could not accept the statement about the letter made by his learned friend, for as far as they knew the letter was absolutely genuine. The writer's name was attached to the original document, which he held in his hand at that moment, and the address he gave them they honestly believed to be his address. The letter came to them in the ordinary way of their duties as newspaper proprietors. On behalf of the defendants, who had left themselves in his hands, he unreservedly expressed regret that the statement should have been made, because undoubtedly the letter did say that the plaintiff should be severely censured for failing to stop on the proper side. The facts were peculiar altogether. The speed at which these 60-h.p. racing cars passed the winning-post was enormous. The actually winning car averaged something like 85 miles per hour, the speed in passing the winning line being at the maximum. The car driven by Mr. Smith had unfortunately shed its tyre in the course of the last lap, which unfortunately caused some of the rivets binding the steel spokes of the wheel to come out. Mr. Smith pulled up as soon as possible after he passed the winning mark. Unfortunately the car remained almost in the middle of the track. Mr. Hermon's car, in going past the winning line, pulled up the banked slope, and in doing this his offside wheel went off the track, and the car turned over. He (Mr. Hall) said unreservedly that it was in no way due to any negligence on Mr. Smith's part, and he had only to tender to Mr. Smith his most sincere regret that this letter found its way into the newspaper. He hoped the insertion of the letter would cause him no damage or detriment whatsoever. The defendants had paid a certain sum into court and pleaded this apology. He had assented to certain terms, which would be endorsed on their briefs, and the record in the action would be withdrawn.—*Central News*.

CHARGE AGAINST CHAUFFEUR.

AT the Town Hall, Chertsey, Harry Bland, a chauffeur, employed by Mr. Trevor Williams, of the Clock Tower, Byfleet, has been charged with having been drunk while in charge of a motor-car, and recklessly driving at Addlestone on the previous day. The prisoner had been admitted to bail, and was represented by Mr. T. E. H. Chaldecott, solicitor, of Chertsey. Application was made for an adjournment by Mr. Chaldecott. This was granted, and the prisoner was admitted to bail in his own surety of £50, and one of £50.

MESSRS. HERWIN, CANNY AND CO. have just opened large works, garage and showrooms at 36, William Street, Woolwich, S.E.

THE site of the works of the Sirdar Rubber Company, Ltd., at Bradford-on-Avon, covers an area of six acres, and the fact that considerable water power is available contributes to their being able to take full advantage of the recent fall in the raw rubber market in consequence.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE Earl of Shaftesbury, Lord Burton, Sir Charles Metcalfe, Bart., Sir Thomas Gooch, Bart., Sir Lindsay Wood, Bart., Messrs. E. A. Brotherton, M.P., W. H. Lever, M.P., and W. H. Cowan, M.P., have been elected to life membership of the R.A.C.

New members of the R.A.C. include H.H. Maharaja Ranjitsinhji, Lord Monson, the Hon. E. S. Montague, M.P., Sir William Bennett, and Major W. Madocks.

AUTOMOBILE ASSOCIATION.

A MEETING of the Northern Committee of the Automobile Association was held in Manchester last week. Sir Nevill Gunter, Bart., of Wetherby, Yorkshire, presided. The chief business under consideration had regard to the extended plans for the present season in the northern counties, and also the extension of the cyclist patrols. The scheme for the further development of the Association's assistance to motorists was dealt with fully, and it was announced that ten extra patrols had been placed on main highways in Lancashire, Cheshire, and neighbouring counties, and twenty had been appointed to various dangerous points on roads in the south-west of Scotland.

De Dion; 10, Dr. Fulham Turner's 12-h.p. Benz; 11, Mr. S. T. Kent's 8-10-h.p. Humber; 12, Mr. Carr Huss's 10-12-h.p. Humber; 13, Mr. Paul's six-cylinder Climax; 14, Mr. Woodhead's 24-h.p. Darracq; 15, Mr. Alsford's 18-22-h.p. Lloyd and Plaister.

The fastest time was made by Mr. Max Graddon's 16-24-h.p. Fiat, who took the hill in splendid style.

BROOKLANDS.

AT the Whitsuntide meeting of the Brooklands A.R.C. the races to be run include the 26-h.p., 60-h.p. and 90-h.p. classes of 150 sovs. each; the second 'All Comers' Handicap Sweepstakes of 2 sovs. each for motor-cars which competed in certain races at Brooklands May meeting; a handicap for private competitors over a distance of five and a half miles for the President's Cup; a handicap for the Household Brigade Cup; the June Sweepstakes of 5 sovs. each; the Naval Motor Cycle Race for commissioned officers in his Majesty's Navy; the Training Plate of 25 sovs. for Austin motor-cars made for the Grand Prix, 1908, the distance being two inner laps, in the first of which two complete tyres are to be changed on each car; and the second Limit Stakes for cars the average speed of which over the three mile course does not exceed fifty miles per hour.

On June 5th the fourteen mile match between Messrs. S. F. Edge and Oscar Cupper in the 26-h.p. class, and a similar match over a seven-

The Middlesex Motor Club's Cat Hill Climb.—Mr. A. C. Denham on the 15-h.p. Humber Car.

MIDDLESEX.

THE hill-climbing contest arranged by the Middlesex A.C. was brought off successfully at Cat Hill, Southgate, on Saturday last. The competition was held under the closed competition rules of the Royal Automobile Club and the R.A.C. handicapping formula, and there were twenty-two entries, of whom fifteen started.

The course was admirably kept by the local police, the necessary permission having been given by the Commissioner.

Col. Bowles, the club's President, acted as judge, Mr. A. W. Gamage, a vice-president, as clerk of the course, Capt. Bagnell-Wild, R.E., handicapper, with Mr. Mitchell as clerk of the scales. The head marshal was Mr. H. Johnson, assisted by Messrs. Simmons, Kerrison, Gillett, and Witham. The whole of the arrangements were admirably managed by the hon. sec. of the club, Mr. J. T. Barber. Mr. J. W. Orde, of the R.A.C., was also present.

The following was the official result:—1, Mr. A. Alexander's 8-h.p. De Dion; 2, Mr. Vincent's 9-11-h.p. Gladiator; 3, Mr. Cannon's 6-h.p. De Dion; 4, Mr. Max Graddon's 16-24-h.p. Fiat; 5, Mr. Cutler's 15-h.p. White steam; 6, Mr. Comley's 16-h.p. Napier; 7, Mr. Denham's 15-h.p. Humber; 8, Mr. Chas. Smith's 12-h.p. Darracq; 9, Mr. Hoare's 6-h.p.

teen miles course between the same gentlemen in the 40-h.p. class will be run. These are for £250 a side. On the Monday the match for the same stakes between Mr. S. F. Edge and Mr. D'Arcy Baker in the 90-h.p. standard class will be contested over a course of twenty-eight miles.

THE SCOTTISH MOTOR TRADE ASSOCIATION, LTD.

THE first quarterly general meeting of the Association was held in the North British Station Hotel, Edinburgh, with Mr. Thomas Shaw, Dundee, in the chair. Those present included:—Vice-president, Mr. W. L. Sleigh (Edinburgh); Messrs. J. H. Paterson (Aberdeen), A. G. Rennie (Glasgow), James Gibbon (Glasgow), Reginald R. Smith (Edinburgh), W. E. Townsend (Edinburgh), John Love (Kirkcaldy), Mr. Kennedy (Glasgow), and Mr. Rutherford (Edinburgh). The secretary submitted a long report of the work done by the Council of the Association, which was unanimously approved.

At a meeting of the Council of the Association the following firms were elected members:—The Continental Tyre and Rubber Co. (Great Britain), Ltd., 3, Cadogan Street, Glasgow, represented by Mr. R. A. Whyte, associate member. The Peebles Motor Co., Ltd., Eastgate, Peebles, represented by Mr. Lawrence Bell, founder member.

The Association's electro, as shown in the accompanying illustration, has been issued to the members of the Association who are entitled to have same imprinted on their stationery. As no company can use this without being members of the Association, and as only *bona fide* motor traders are eligible for admission, this electro is invaluable to its members and the motor trade.

At a council meeting of the Scottish Motor Trade Alliance, held in Edinburgh, the following companies were elected members:—Messrs. Thomas Shaw (Dundee), Ltd., represented by Mr. Thomas Shaw; James Gibbon and Sons, Glasgow, represented by Mr. James Gibbon; Rossleigh, Ltd., Edinburgh, represented by Mr. W. L. Sleight; Caledonian Motor-car Company, Ltd., Aberdeen, represented by Mr. J. H. Paterson; Middleton and Townsend, Edinburgh, represented by Mr. W. E. Townsend; Rennie and Prosser, Ltd., Glasgow, represented by Mr. A. G. Rennie; Scottish Automobile Company, Ltd., Edinburgh, represented by Mr. T. M. Sleight; Knowles and Cumming, Nairn, represented by Mr. Knowles; David Millar and Sons, Crieff, represented by Mr. A. Millar; Wilson and Vass, Oban, represented by Mr. Wilson; A. W. Chapman and Co., Inverness, represented by Mr. Chapman; Robert Anderson, Newton Mearns, represented by Mr. Anderson; Peebles Motor Company, Ltd., Peebles, represented by Mr. Laurence Bell; Alexander Paterson, Elgin, represented by Mr. Alexander Paterson; Wilfred Foulis, Ltd., Edinburgh, represented by Mr. Foulis.

Motor traders in Scotland who have not yet received particulars should apply for same to the secretary, Mr. David A. Fairley, C.A., 13, York Place, Edinburgh.

MANCHESTER.

LAST week we recorded the interesting reliability trial of 132 miles organised by the Manchester A.C., and gave the fuel consumption and time of the various contestants. Seventeen cars out of twenty-eight entered obtained non-stop certificates, and only six cars failed to complete the course within the prescribed time and in accordance with the regulations. In awarding marks for petrol consumption due attention was given to the weight of the car and the load carried, and the results below are based on the actual number of ton miles per gallon of petrol used. In calculating the result of the hill climb the factors considered were the weight and horse-power of the car and the time taken in ascending the hill. The horse-power was ascertained by the following formula:—

$$D^2 \times \sqrt[3]{S \times N}$$

where D = diameter of cylinders. S = piston stroke, and N = number of cylinders. Marks were lost for non-reliability on a sliding scale by which long stops were relatively more severely penalised than stops of less than five minutes' duration. Mr. H. W. Lee's silver cup for the best performance, irrespective of class, was awarded to Mr. J. L. Tattersall, whose 20-h.p. Belsize obtained the maximum number of marks for economical petrol consumption and also did exceedingly well on the hill climb:—

| Entrant and Car. Class 1 (amateurs). Section A. | Weight. T. c. q. | H.M.L. Petrol con- sumption marks. | Relia- bility marks. | Total marks. |

| J. Newton, 22-h.p. S.C.A.T. .. | 1 9 0 | 183 | 107 | 600 |

In Class 1, for amateurs, Mr. G. B. Heywood was awarded the silver, and Mr. H. W. Lee the bronze medal in Section A, Mr. J. L. Tattersall took the cup and silver medal in Section B, and Mr. J. Duckworth the bronze medal. In the trade class silver medals were obtained by Messrs. J. Crawford and V. G. New, and bronze medals by Messrs. H. Hollingdrake and T. Hooydonk.

THE Wolverhampton and District A.C. will have a hill climb on the Calport Hill, near Ironbridge, Salop, on July 4th. Entries close on June 24th, and all information may be obtained from the hon. secretary, at Royal London Buildings, Wolverhampton.

KENT.

THE Kent Automobile Club, which has its headquarters at the Royal Star Hotel, Maidstone, was formed in 1903, and has rendered good service to the motorists of the county by carefully watching the local administration of the Motor Car Acts and regulations and maintaining the general survey for the improvements of roads, erection of sign and danger signals, &c. The Marquis of Camden is the patron, with Sir David Salomons, Bart., as president. Mr. W. Willis is the chairman of the committee, and a sub-committee has been formed for the East Kent division. The hon. secretary and treasurer is Mr. G. M. Kenyon, of Wycliffe Lodge, Bromley, Kent.

In conjunction with the Royal Automobile Club's examination held at the Spa Hotel, Tunbridge Wells, on Saturday, this club held a luncheon meet at that hotel. The fine weather brought a very large number of members and friends together, over fifty sitting down. Dr. Charles Firth presided, and the visitors included Messrs. Alfred Hicks, Dr. Watson, Maxwell (the Borough Surveyor of Tunbridge Wells), Beever, Fox and Smith (the examiners for the R.A.C.). Dr. Firth, in welcoming the visitors, pointed out the usefulness of the R.A.C.'s driving certificate, and hoped that many of those present would utilise the afternoon in attempting to obtain this club's gold medal for mechanical proficiency. Mr. Hicks and Mr. Beever replied on behalf of the visitors. Mr. A. Booth-Hearn then proposed the health of the chairman.

The 25-30-h.p. Milnes-Daimler Char-a-banc recently supplied by Messrs. H. J. Chapman and Co., Ltd., of Regent's Park, N.W., to the Mid-Glamorgan Motor Company, of Aberavon, by whom it will be used to convey colliers between the Ocean Collieries, Treorchy and the Cribbur Farm Collieries, Pyle, Bridgend, Port Talbot.

The chassis, which until recently was in regular service as a motor-bus in London, has been fitted with a neat and light char-a-banc body of Messrs. Chapman's design.

ESSEX.

At Lippett's Hill, High Beech, on Saturday, the Essex M.C. held an open hill climb, when the results were as follows:—

Handicap for light cars of a chassis price up to £200.—1, V. Riley's 9-h.p. Riley (35 sec.) 268.8 points on formula; 2, W. M. Letts' 9-h.p. Sizaire-Naudin (zero) 272 points; 3, C. Jarrott's 9-h.p. Sizaire-Naudin (4½ sec.) 295 points. The fastest time was made by W. M. Letts' Sizaire, which beat the Riley by ½ sec. and other competitors by times ranging up to 50½ sec.

Several motor-bicycle events were decided as follows:—Motor-cycles up to 2½-h.p.: 1, G. L. Fletcher, 2-h.p. Moto-Reve; 2, R. M. White, 1½-h.p. Hazel. Passenger motor-cycles: 1, R. M. White's 7-h.p. Brown; 2, A. P. Howard's 9½-h.p. Singer; 3, F. Cozens, 10-h.p. Lagonda. Single-cylinder motor-cycles up to 82 mm. bore: 1, R. M. Brice, 13½-h.p. Brown; 2, E. Varney, 2½-h.p. Givandun; 3, L. W. Bellen-ger, 3½-h.p. L.M.C. Single-cylinder motor-cycles up to 85 mm. bore: 1, C. B. Heaton, 4½-h.p. Noble; 2, R. M. Brice, 3½-h.p. Brown; 3, G. Gibson, 3½-h.p. Triumph. Single-cylinder motor-cycles up to 90 mm. bore: 1, R. M. Brice, 3½-h.p. Brown; 2, W. Jacobs, 3½-h.p. Rex.

In the twin-cylinder bicycle section the results were:—Up to 76 mm. bore, 1, F. W. Applebee, 5-h.p. Rex; 2, C. R. Collier, 6-h.p. Matchless; 3, F. W. Applebee, jun., 5-h.p. Rex. Up to 80 mm. bore: 1, F. W. Applebee, 5-h.p. Rex; 2, F. W. Applebee, jun., 5-h.p. Rex; 3, O. C. Godfrey, 5-h.p. Rex. Up to 85 mm. bore: F. W. Applebee, 5-h.p.

Rex; 2, F. W. Applebee, jun., 5-h.p. Rex; 3, O. G. Godfrey, 5-h.p. Rex.

In the section for members not connected with the trade, E. Varney, 3½-h.p. Givandun was first in the single-cylinder section, A. G. Reynolds, 5-h.p. Vindec, in that for twin-cylinders up to 76 mm., and E. J. Bass (the hon. sec. of the competition) 7-h.p. Peugeot, in that for twin-cylinders up to 80 mm.

WEST ESSEX.

THE result of the 80 miles competition on the 9th inst. for the Gamage Cup was that the following made non-stop runs:—Messrs. R. E. Denby (3½-h.p. Brown), W. E. Gunnett (3½-h.p. Triumph), W. M. Gunnett (3-h.p. Triumph), V. Baldwin (3½-h.p. Brown) and G. W. Glenny (8-10-h.p. Darracq). The final, in order to find the winner, will be run off in June, and will take the form of a speed judging competition.

The inter-club contest with the Essex M.C. will be held to-day (Saturday). The course will be a circular one from The Castle, Woodford, by Sewardstone, Waltham, Epping, Ongar, Chigwell, back to Woodford. The circuit, covered twice, totals 70 to 80 miles. The team consists of four motor-cycles, one passenger motor-cycle and one car. The motor-cyclists will ride in pairs, one rider from each club, to observe one another. Passenger vehicles will carry the other club's representative as observer.

The next club competition is the 100 miles reliability run for motor-cycles only for the club cup, and will be held on Saturday, June 13th.

HERTFORDSHIRE.

THE results of the Hertfordshire C.A. Members' 50 miles Consumption Trial held on Saturday last are as follows:—

| Car. | Entrant. | Gallons per Ton mile. | Miles per gallon. | Placing. |
|-------------------------|---------------------|-----------------------|-------------------|----------|
| 10-h.p. Argyll, | Mr. J. E. Young | ·0174 | 48·6 | 1 |
| 20-h.p. Rover, | Mr. F. J. Jenkins | ·0185 | 32·05 | 2 |
| 8-h.p. Phoenix, | Mr. J. Hooydonk | ·0288 | 51·4 | 3 |
| 10-12-h.p. Humber, | Mr. R. V. Beveridge | ·032 | 23·2 | 4 |
| 18-h.p. Clement, | Mr. A. Hunt | ·0332 | 22·5 | 5 |
| 20-h.p. Rothwell, | Mr. W. G. James | ·034 | 22·0 | 6 |
| 20-h.p. S.P.A., | Mr. S. Marples | ·037 | 18·0 | 7 |
| 14-16-h.p. Fiat, | Mr. H. W. Colliver | ·04017 | 15·35 | 8 |
| 7-8-h.p. Swift, | Mr. A. J. Salmon | ·0474 | 25·5 | 9 |
| 10-h.p. Lagonda Tricar, | Mr. H. J. Stewart | ·060 | 37·6 | 10 |

NORWOOD AND DISTRICT.

SEVERAL enthusiastic motorists in the Norwood district have formed a motor club, of which Mr. Douglas S. Cox is the captain and Mr. W. H. Wilson, 2, Wolfington Road, West Norwood, is the hon. secretary. The annual subscription has been fixed at half a guinea, and a preliminary run will be held on Sunday (the 24th inst.) to Box Hill.

THE MOTOR CYCLING CLUB.

THE date for the Motor Cycling Club's London to Edinburgh, twenty-four hours' run and London to Edinburgh and back competitions for the Schulte Cup and M.C.C. Challenge Cup is rapidly drawing near, and the list of entries will shortly be closed. Application forms for membership can be obtained from the hon. sec., Mr. A. Candler, 1, Lime Grove, Shepherd's Bush, W., and should be applied for immediately, as Monday next, May 25th, will be the last day for the election of new members before the competition, which takes place at Whitsun.

WELSH.

AT Philadelphia Hill, Carmarthenshire, the Welsh Automobile Club will hold a hill-climbing competition on Thursday, June 4th. Mr. James Livingstone, J.P., will be the judge, and Mr. J. Shimell Andrews, of Rutland Street, Swansea, is the hon. secretary of the meet. All persons entering for the contest will be subjected to the closed competition rules of the Motor Union, under which it is held. On the following day the club will hold a motor-cycle hill-climbing contest, when Captain D. Hawes Morgan will be the judge. Particulars for both contests close on the 25th inst.

THE Halifax Cycle Club has its headquarters at the Old Cock Hotel, Halifax.

THE Leicester A.C. held its first meet of the season at Ashby de-la-Zouch on Saturday.

MR. TURNER, of Haslingden, made the fastest time on his 6-h.p. N.S.U. motor-cycle at the Lancashire M.C.C.'s hill climb on Bunker's Hill last week.

ENTRIES for the Crystal Palace Club's Flexibility Trials close on Monday next. They should be sent to Mr. F. W. Bailey, 35, Earlsthorpe Road, Sydenham, London, S.E.

THE Home Counties Garage Company, Ltd., is carrying on a motor hiring department from the Green Man Garage, Leytonstone, London, N.E.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.
